The American leader had scored his first triumph, and, that assured, he hastened with his army to New York, where, it was shrewdly judged, the British would strike next. Congress urged him to hold the city at all hazards, and contrary to his better sense, he attempted the impossible. Without the control of the sea, New York, on its narrow strip of land thrust far down between two navigable waters, was a deadly trap. A military genius would have refused the risk, but Washington ventured it, half believing for a time that he might succeed. He placed his army in a position where every probability pointed to defeat, followed by almost certain capture or destruction. Had Howe not taken such tender care of his enemy's safety, all might have ended there. Washington was able to withdraw from Brooklyn, 30 Aug. 1776, after the defeat on Long Island, and then to evacuate New York and get behind the Haarlem, because, as an English critic said, Howe calculated with the greatest accuracy the

WASHINGTON

exact time necessary to allow his enemy to escape. The unbounded confidence of Washington's countrymen had proved too much on this occasion for even his steady judgment, and in response to their enthusiasm he had tried to hold a position and defend a place for which his resources were inadequate. He had become for the moment a source of danger to the Americans because they did not understand his real greatness.

Washington realized keenly his own lack of military experience on a large scale—he had no heaven-born genius, and he knew it. The skill that he finally attained was that which a strong-brained, sensible man would get in any vocation which he plied industriously, and to which he gave his heart. Washington learned as he fought, and his early errors with the consequent disaster, grew steadily less, until, as a master of his profession, he issued from the war without a peer and almost beyond the reach of envy. Yet not even his ultimate military greatness explains his real service to his countrymen. It was the confidence that Washington inspired as a man, rather than his great genius as a soldier, which made him the only man in America who could carry the Revolution to a successful issue.

After losing New York Washington fought step by step, as he retreated, repulsing the British at Haarlem Heights and holding his own at White Plains, 28 Oct. 1776, but the meddling of Congress cost him some 3,000 men captured in Fort Mifflin, and then there was nothing for him but a retreat from the Hudson through New Jersey. This was not the only time that the democratic faction in Congress forced their military plans upon their commander-in-chief. He was much hampered at first by Congressional interference in his military plans, but he soon won the limitless faith of these democratic enthusiasts, conquering all their fear of military despotism and gaining in the disposal of his own army the supremacy of a Frederick or a Gustavus Adolphus.

As the American army fell back mile after mile the character of the leader was tested to its utmost. His generals grew insubordinate, his men deserted by whole companies, throughout the Jerseys thousands took oath of allegiance to George III., and everywhere there were murmurs of discontent with this sort of a campaign. Then it was seen that Washington's courage was not mere disregard of danger, but the sort that long endures uncertainty and never shrinks responsibility, bearing in silence temporary unpopularity or exasperating misrepresentation.

When the army at last crossed the Delaware the roll-call would muster but 3,000 men. Straining his powers to the furthest bounds, Washington kept this force together, and added as many more. Concerning some of his extraordinary measures, Washington wrote Congress: "A character to lose, an estate to forfeit, the inestimable blessing of liberty at stake, and a life devoted must be my excuse." Before the holidays he was ready to strike a blow for liberty, and to sustain his character. Crossing the Delaware, 25 Dec. 1776, in spite of pitchy darkness and grinding ice, he marched through a sleeting storm nine miles to Trenton. The Hessians there were surprised and driven to surrender. Some 1,000 prisoners were taken

to the other side of the river, and then Washington crossed again to win another victory at Princeton. The whole situation was changed. The wretched retreat was forgotten or regarded as only the prelude to the startling and brilliant victories. In England, Walpole declared that Washington was both a Fabius and a Camillus. His whole campaign got a new color because of its issue. In the Russian court, in Frederick's cabinet, and in the aristocratic circles of Paris, Madrid, and Vienna the campaign was praised as if the end had been in Washington's view from the first. The victories made Washington's military reputation rest on something tangible, to which men might point. Mere faith such as the Americans had shown heretofore had little effect on foreign critics. The European soldiers grew more interested, and their favorable opinion had vast influence in winning foreign aid. Washington had been so consistently patient and brave in adversity, so silent under unjust criticism, never talking down his mistakes, or glossing his errors, that the hour of victory brought its ten-fold reward in sympathy and confidence. He had quietly assumed so much obloquy that any stint of his praise seemed unjust and ungenerous. The victories renewed American confidence in their leader, and from that time on whatever there was of unity for political or military purposes among the 13 States came of the common faith in Washington.

Congress now put its whole trust in him—until a temporary reverse put him again in the shadow of its distrust. It provided for long enlistments to take the place of the evanescent three months' levies that had ruined Washington's army heretofore, just as he had it drilled. He was made a veritable dictator as to all that might affect the success of the army, its discipline, and its supplies. It was well that the commander-in-chief had made this brilliant stroke, which appealed to all those who saw only the surface of the Revolution. For 18 months thereafter nothing but reverse and misfortune and terrible trial fell to the leader's lot. While Gates was gathering unearned laurels at Saratoga, and the American cause was vastly advanced by Burgoyne's defeat and the consequent French alliance—while others were getting glory and significant victories, Washington was maneuvering with Howe, always refusing battle, or, as at Brandywine Creek, 11 Sept. 1777, and Germantown, 4 Oct. 1777, meeting defeat. To the superficial observer there was only failure for Washington and success for his rivals. There seemed no great work in merely keeping an army together, delaying Howe and keeping him from going north to Burgoyne's rescue. When, at last, the British settled down cosily in the "rebel capital"—when Philadelphia had taken Howe, as Franklin so cleverly expressed it—Washington encamped at Valley Forge, 19 Dec. 1777, his popularity waning at the very moment when he began to render his greatest service to his country. There, in the most trying hour, he continued to do what had been his greatest task from the first. In spite of jealous States and a wrangling Congress, and while deprived of all that source of power which a strong government gives to a commander, Washington kept together a starved and suffering army by his personal firmness, patience, and judicious handling of men.

WASHINGTON

While the burden of his trial was greatest there grew up in Congress an ugly scheme to put Gates in Washington's place. From the first there had been intrigue among the officers. "I am wearied to death," John Adams wrote, after a visit to the army, "with the wrangles between military officers high and low. They quarrel like cats and dogs. They worry one another like mastiffs, scrambling for rank and pay like apes for nuts." Amid this Washington had lived disturbed, but not concerned for himself. Now Congress was implicated in the plotting. Some were impatient with the Fabian policy, and, like Adams, wanted "a short and violent war." A conceited or vain man would have resigned and let the whole cause go to perdition as a vindication of himself, but Washington was nobler than that. Throughout the Revolution he kept the same spirit that animated him in the earlier years of border fighting. Then he had declared: "I could offer myself a willing sacrifice to the butchering enemy, provided that would contribute to the people's ease." He could "die by inches to save a people." During the Revolution he risked reputation, sacrificed popularity, suffered in mind and heart all that he had been willing to suffer in body to "save a people." Now he silently watched the plot ripen, and at the right moment exposed it with a royal contempt that quite crushed the plotters.

When the winter was gone there came the news of the French alliance. A fleet from France was menacing the British army in Philadelphia, and orders came for the evacuation of the city. They began a march toward New York across New Jersey. At Monmouth, 28 June 1778, the American army fell upon them, and, but for the cowardly or traitorous conduct of Gen. Lee, nothing but the fragments of the English army would have reached its destination. In that moment men saw what a tempestuous nature Washington habitually held in check. He stopped the retreat that Lee had unaccountably ordered, and in ungoverned rage cursed him for a coward. The troops were rallied, and they successfully engaged the enemy, but the moment for victory had been lost. The British reached New York in safety and Washington took a post on the Hudson.

Now came the supreme test that proved the American leader's unrivaled fitness for the work that he had to do. For three years, while Congress was helpless, unable to tax or get aid from the States, while it paid the soldiers in paper, so valueless that the pay of a colonel would not purchase oats for his horse, while nothing but a forced levy would secure food for the army, when a hundred men a month went over to the enemy in sheer desperation with suffering for food and clothing, while the great country that had so much at stake seemed absolutely indifferent—in the midst of blank despair Washington kept his heart and his purpose. Again and again he was disappointed by the failure of the promised aid from France—the naval aid that would prevent the British escape by sea if they were worsted on land. At last, however, the moment came when De Grasse with a French fleet held a temporary control of the sea, and Lafayette had pushed Cornwallis out on the peninsula at Yorktown. A few days' hesitation would have lost the opportunity, but the man who had waited three

years knew the moment for action when he saw it. Making a feint that deceived the enemy at New York, he got well on the way before his aim was guessed. For 400 miles he urged his eager army, and brought 6,000 men to Lafayette's aid at just the hour to render Cornwallis' escape impossible. The siege that then began could have but one end as long as De Grasse controlled the sea. The British surrendered, 19 Oct. 1781, and the war was ended.

As men looked back over the years of strife, they saw clearly that the greatest factor in the final success of the Revolution was the personal leadership of Washington. If we seek to explain it, it was not his great mind, for Franklin's was greater; not his force, energy, or ingenuity, for Benedict Arnold surpassed him in these qualities; not his military experience, for Charles Lee's was far more extensive; but it was the strength of character which day by day won the love of his soldiers and the perfect confidence of his countrymen. The absence of a mean ambition, the one desire of serving well his country and his fellow men, the faithfulness that could not be driven from its task through jealousy or resentment—these were the traits that gave him a unique and solitary place among the world's heroes.

Washington's service to his country was not to end with Yorktown. As he had been "first in war," because he was most fitted, so his unique character and pre-eminent place in American hearts fated him to become "first in peace." His last successes had still more firmly fixed his power among the people. Their thoughts and imaginations were filled with him. But they had not even yet seen the sublimity of his character. With a discontented and insubordinate army still in arms and with no real government in existence, Washington was the only source of authority and law that had anything more than a local influence. The weak Union might have at once lost all cohesion, and America might have degenerated into a number of petty, feeble, and hostile States. Worse than that the hopes for an American republic might have been indefinitely delayed, for, in the despair which settled upon many, there seemed but one escape from the political storm that threatened—they would make Washington king. In the army this plan was gravely considered, but when broached to Washington, he expressed himself as pained that such ideas existed in the army. "I am much at a loss to conceive what part of my conduct could have given encouragement to an address which to me seems big with the greatest mischiefs that can befall my country." To nobody could such a thought be more disagreeable, he declared earnestly. "Let me conjure you, if you have any regard for your country, concern for yourself or posterity, or respect for me, to banish these thoughts from your mind."

When the country seemed indifferent to the deserts of the army, when there was talk of disbanding it without provision for the future or even pay for what it had done, and when as a natural result there was mutiny and threat that the army would take government into its own hands—then it was Washington who tirelessly urged upon Congress and upon the States the justice of the soldiers' claims. Though he longed to go back to his home and to have his work done, yet he waited through

exact time necessary to allow his enemy to escape. The unbounded confidence of Washington's countrymen had proved too much on this occasion for even his steady judgment, and in response to their enthusiasm he had tried to hold a position and defend a place for which his resources were inadequate. Though he longed to go back to his home and to have his work done, yet he waited through

WASHINGTON

months of weariness until the British really left the country, and until the proper laws at least had been made to insure the soldiers' rights. Then at last, he stood among his officers at Fraunce's Tavern, bidding them to take him by the hand, while he gave them each and all the warm-hearted farewell that so fittingly ended their long years of trial and companionship.

For a brief time Washington now became "a private citizen on the banks of the Potomac" . . . "free from the bustle of a camp and the busy scenes of public life," planning as he said to "move gently down the stream of time until I sleep with my fathers." He did not see in this happy hour that his past services had but devoted him to further service, and that he had become "the focus of political intelligence for the New World." Even before resigning his leadership he had urged the States to put faction and jealousy away and make "an indissoluble union under one federal head." As the affairs of the confederation became more and more deranged, and America, "like a young heir," as Washington wrote, wanted and ran riot until its reputation was brought to the brink of ruin, their great leader warned them that it was in the choice of the States and depended upon their conduct, whether they would be respectable and prosperous, or contemptible and miserable as a nation.

The politically starved Congress grew daily weaker. It could not even persuade the States to carry out the terms of the treaty of peace or pay their debts to foreign countries. Congress was despised at home, and America was disgraced abroad. The world looked on to see the confederation go to pieces. Within the individual States the mob seemed to have gained control and the law-giving bodies abandoned themselves to paper money and other economic vagaries. There was quarreling over State boundaries and commercial restrictions, one State against another, until thoughtful men like Washington urged that, if they were not a united people, they should no longer act the farce of pretending it. At last, however, his own endeavors united with others brought about a convention of the States, and that led to another which met at last in May of 1787, at Philadelphia, destined, if not purposed, to give America a new and stronger frame of government. To that convention Washington reluctantly came. He thought himself a soldier but no statesman. When at last he was persuaded that the chief hope for success must come from his approval, and that his mere presence would lend dignity and power to the convention, he yielded. As the delegates slowly assembled, he grew eager for the success of the work, and would listen to no half-way measures. "Let us raise a standard to which the wise and the honest can repair," he said to those who talked of a weak plan. When the work began he was chosen president of the convention, and though he was no parliamentarian, his prominent place lent gravity and steadiness to the business.

After the Constitution was completed, and when it was before the country for approval, Washington had never been seen so eager for anything as for the adoption of the new scheme of government. It was only by active letter-writing that he used his influence, however, for the work of the politicians was out of character for him. The final success was very grate-

ful to him, but, when the new government was being set up, and the whole country turned to him as their choice for President, he held back, diffident and reluctant. He yielded at last because, as Hamilton represented to him, "In a matter so essential to the well-being of society as the prosperity of a newly instituted government, a citizen of so much consequence as yourself to its success has no option but to lend his services."

His was a noble figure to stand in the forefront of a nation's history. His simple manner well graced a republic, and yet there was a gravity and a lofty courtesy that lent dignity to democratic forms. His own self-mastery was a living lesson to democracy with its ill-repute for turbulence. No more fitting ideal of manhood could have been chosen for a new republic. It is, indeed, creditable to the men of that day that they were won by a character so unpretentious.

The political leadership was very unattractive to Washington. When the formality of election was over, he went to the seat of government with "feelings not unlike those of a culprit who is going to the place of execution." He bade adieu to private life and to domestic felicity, going to his new duties with resolution, but anticipating no joy in them. On his way the demonstrations of the people only filled him with forebodings. "The decorations of the ships, the roar of the cannon, and the loud acclamations of the people which rent the skies as I walked along the streets, filled my mind with sensations as painful as they are pleasant." After he had sworn, 30 April 1789, in the open balcony of the Federal Hall, that he would faithfully execute the office of President of the United States, he read his address in the Senate Chamber. "The magnitude and difficulty of the trust," he protested once more, "could not but overwhelm with despondence one who, inheriting inferior endowments from nature, and unpractised in the duties of civil administration, ought to be peculiarly conscious of his own deficiencies."

He realized keenly from the first that he walked "on untrodden ground." Scarcely any part of his conduct might not thereafter be drawn into precedent. There must not be a government only, but a body of public opinion that would uphold it. Governmental action must be mixed of firmness, prudence, and conciliation, said Washington, if it would win liking and loyalty as well as respect. He resolved to give it every proper form of dignity, ceremony, and prestige that would appeal to the imagination of the people. Men must see that it was a real government, supreme in the land. To this end he adopted forms that some thought stiff, some unrepugnant, but which all were soon taught to respect. "If there are rules of proceeding," he wisely concluded, "which have originated from the wisdom of statesmen, and are sanctioned by the common assent of nations, it would not be prudent for a young State to dispense with them altogether."

It was not by this conservatism alone that he gave strength to the new government, but by that unerring judgment which led him to choose men like Hamilton, Knox, Jefferson, and Randolph, and then to take for his guide Hamilton, the greatest of these for the present needs of the government. Natural leader as Wash-

WASHINGTON

ington was, he recognized the gifts and talents of others, and gave to each the task for which he was fitted. Hamilton's genius in affairs had not been in just the lines along which he was now to act, but his bold and original mind Washington saw to be a fit instrument to set the new government on a strong foundation. Hamilton quickly demonstrated the wisdom of the President's choice. He funded the public debt and established confidence in the nation's honesty. He prevailed upon Congress to assume the State debts and thus transferred the interest of creditors to the central government. A bank of the United States was created at his call, the "implied powers" of the Constitution being thus brought to the support of a strong government, and the commercial classes won by this attention to their interests. He was enabled to do these things successfully because he had the strong will of Washington with him. The fiscal measures had been made the President's own, because he was convinced that they were right, not merely that they were expedient. The end that was sought was the purpose that Washington held from the first, a strong and righteous government.

Hardly had things been set aright in the new nation's household than there came disturbing forces from abroad. The French people had gone upon a wild quest for liberty that threatened to turn the world upside down. The madness spread even to America — or rather seemed to leap by a strong attraction straight to America's democratic shores. France was soon fighting the conservative world, and what was more fitting than that liberal America should come to her aid? A French agent hastened to America to ask the people that very question. Washington determined that America, herself but "in a convalescent state," should not be drawn into the European struggle. She was too provincial at the best, too interested in European opinion and politics, and too oblivious of her own nationality. "I want an American character," the wise President declared, "that the powers of Europe may be convinced we act for ourselves, and not for others." He would avoid their disputes and their politics, and he purposed "if they will harass one another, to avail ourselves of the neutral conduct we have adopted." Washington, with a few others, stood almost alone in the advocacy of statesmanship rather than sentiment. In a few months, however, the public eyes were able to see more clearly, and the administration got the support that it deserved. The demands of the French revolutionary government were refused, and the President issued a proclamation of neutrality.

Meanwhile the country had learned that the new central government proposed to enforce its laws even within State boundaries. The rebellion in the back counties of Pennsylvania was quelled by the strong action of the central power. There could be no return to the time when there was no power but that of an individual State. The national government was expected thereafter to make itself felt directly upon the individual, and men began to look to it therefore in awe and reverence.

A second time Washington consented to hold the reins of power, and again, as in the Revolution, he felt the bitterness of unpopularity. All the honor that he had gained could not protect him from the hasty wrath of a people dissatis-

fied with his policy toward England. Because he strove for peace he was roundly abused in terms scarcely suited "to a Nero, a notorious defaulter, or even a common pickpocket." It saddened but did not change him. He was only the more unwilling to serve another term, and, when his eight years of civil service ended, he said farewell to the people he had served through a generation. He gave them the simple advice that they most needed. Tears coursed down his cheeks as he turned for the last time from the throng that had listened to him in love and sorrow. Three years he lingered in retirement at Mount Vernon, and then died, 14 Dec. 1799, as he had wished to live "amid the mild concerns of ordinary life."

CLAUDE HALSTEAD VAN TYNE,
Professor of American History, University of Michigan.

Washington, the "Evergreen State," admitted to the Union, 22 Feb. 1889, is bounded on the north by the Strait of Juan de Fuca and British Columbia, on the east by Idaho, on the south by Oregon, and on the west by the Pacific Ocean. Capital, Olympia. Area, 69,180 square miles (land 66,880, water, 2,300). Population (1900) 518,103; as estimated by the State Bureau of Statistics (1903) 759,687.

Topography.— Washington is divided into two distinct sections by the continuous range of the Cascade Mountains, extending clear across the State from north to south. These sections are known as eastern and western Washington. The eastern section contains about three fifths of the land area of the State and the western section about two fifths. In its physical features the State is characterized by a great diversity of topography, ranging from low plains, a few feet above the sea-level, to snow-covered mountains, several of which exceed 10,000 feet in height, together with broad, rolling prairies, elevated plateaus, deep cañons and fertile valleys. This great diversity of topography presents ever changing scenery and gives rise to a great variety of climate, rainfall, vegetation and occupations of the people.

Topographically, the State may be divided roughly into seven sections: *First:* The peninsula lying between Puget Sound and the Pacific Ocean. The greater part of this peninsula is occupied by the Olympic Mountains, which form a segment of the general coast range. The highest of these mountains reach elevations of from 7,000 to 8,000 feet. The whole section, with the exception of a strip a few miles in width along the coast, presents a very rugged surface, broken into high peaks, steep slopes, deep cañons and sharp serrated divides, which are almost inaccessible in many places, and as a consequence, these mountains form the least known section of the United States. The high-

WASHINGTON

est peaks of the Olympics are Mount Olympus, 8,131 feet; Fitzhenry, 8,098 feet, and Constance, 7,777 feet. *Second:* The Puget Sound basin, a wide valley lying between the Olympic Mountains on the west and the Cascade Mountains on the east, extending in a north and south direction from the British Columbia line nearly to the southern part of the State. This basin consists largely of rolling land with many quite extensive level tracts. The soil consists principally of glacial deposits covered in the lower portions by alluvium. *Third:* The Cascade Mountains, which form the most prominent feature of the topography of the State. The general height of these mountains is about 8,000 feet above the sea-level with a number of peaks rising much higher, the highest being Mount Rainier, 14,526 feet; Adams, 12,470 feet; Baker, 11,100 feet; Saint Helens, 9,750 feet, and Stuart, 9,470 feet. *Fourth:* The Okanogan Highlands, extending eastward from the Cascade Mountains to Idaho and lying north of the Columbia and Spokane rivers. This section is characterized by a beautiful rolling surface, with long, gentle slopes reaching down from the watersheds to the wide stream basins. The divides, although attaining heights of 5,000 feet and more, are generally rounding and not sharp or abrupt. *Fifth:* The Columbia plain, which includes nearly all that part of Washington lying south of the Okanogan Highlands and east of the Cascade Mountains. From the Columbia at a height of 500 or 600 feet above the sea, the plain rises gradually to the westward and eastward, reaching a general elevation of about 2,000 feet in the higher parts, with some hills and ridges rising from 1,000 to 2,000 feet above the surrounding plain. Much of this plain is in the form of an elevated plateau with a rolling surface. Several sharp ridges of a mountainous character run down from the Cascade Mountains in an easterly direction toward the Columbia River. *Sixth:* The Blue Mountain Range on the border line of Washington and Oregon represents a local mountainous section in the Columbia plain. These mountains are located in the extreme southeastern portion of the State, the highest points rising 7,000 feet above the sea and about 5,000 feet above the surrounding plain. *Seventh:* The lower Columbia and Pacific Coast section includes that part of the State lying west of the Cascade Mountains and south of Puget Sound and the Olympic Mountains. This section consists largely of ranges of low mountains or hills, with broad valleys intervening, nearly all of which are covered with a dense growth of forest. In this section there are also a few rich prairies of limited extent.

Rivers, Lakes and Harbors.—The principal river of Washington is the Columbia, which enters the State from British Columbia, at about 117° 30' W. longitude, from which point it pursues a southerly course for about 110 miles, flowing thence westerly for about 100 miles, thence south and southeasterly for 225 miles where it unites with its greatest tributary, the Snake River; from this point it pursues a westerly course, flowing between the States of Washington and Oregon, breaking through the Cascade Mountains and entering the Pacific Ocean in lat. 46° 15'. Its principal tributaries in eastern Washington are the Pend d'Oreille, or Clark's Fork, which is the outlet of Lake Pend d'Oreille in northern Idaho; the Spokane

one of the largest tributaries, the outlet of Lake Cœur d'Alene, also in Idaho; the Okanogan, flowing from the north through Lake Okanogan in British Columbia; the Methow; Lake Chelan and its outlet; the Wenatchee and the Yakima, flowing down from the Cascade Mountains, and the Snake River, its largest tributary, which rises in the western part of Wyoming and flows through the southern part of Idaho. In western Washington its principal tributaries are the Lewis and the Cowlitz rivers. The other rivers of the State of any considerable size are the Nooksack, Skagit, Stillaguamish, Snohomish, Skykomish, Snoqualmie, Cedar, White, Duwamish, Puyallup and Nisqually, which flow into Puget Sound from the Cascade Mountains and the Chehalis which flows into Gray's Harbor. The Columbia is navigable for ocean-going vessels to Vancouver and for steamboats over the greater part of its course. The Snake is navigable for more than 150 miles. The Okanogan, Lewis, Cowlitz, Nooksack, Skagit, Snohomish, Duwamish, Puyallup and Chehalis rivers are also navigable for considerable distances.

There are many fresh water lakes in the State. The largest is Lake Chelan, lying between the eastern ridges of the Cascade Mountains. This lake is 50 miles long, from one to three miles wide and more than 1,500 feet deep in many places. It extends from a point near the Columbia River into the very heart of the mountains, and the tourist can here enjoy the novel experience of sailing for more than 30 miles between high ranges of mountains, rising from the water's edge, whose snow-crowned peaks reach elevations of from 7,000 to 10,000 feet above the sea. This part of the State has some of the grandest scenery in the world. Lake Washington, lying in the western part of King County, bounding Seattle on the east, is a beautiful lake 22 miles long, and from 2 to 4 miles wide. The surface of this lake is about 20 feet higher than the mean high tide in Puget Sound, and a government canal is now under construction, at Seattle, to connect it with the Sound. Lakes Crescent and Cushman are the largest lakes in the Olympic Mountains and lakes Wenatchee, Kalchess, Kichelos, Moses and Cle Elum, are the largest in eastern Washington.

Willapa Harbor and Gray's Harbor are the only good ports on the Pacific Coast. Neah Bay, Clallam Bay, Port Angeles and Dungeness are excellent ports on the Strait of Juan de Fuca. Puget Sound, as it is now known, includes all the waters of the great inland sea, which extends easterly from the Strait of Juan de Fuca, and southerly from the national boundary line to Olympia, a distance of about 200 miles. The waters of the Sound are from 60 to 1,000 feet in depth. The rise and fall of the tide ranges from 9 to 18 feet. There are no sunken reefs or other dangerous obstructions to navigation. The coast line aggregates about 1,600 miles in length. The principal harbors along the Sound are Bellingham Bay, Everett Harbor, Port Townsend, Seattle Harbor, Commencement Bay or Tacoma Harbor and Port Orchard. Owing to the fact that Puget Sound is protected on all sides by high mountain ranges, it may be considered as one great harbor in which vessels can land at almost any point along the whole coast line.

Climate and Rainfall.—Owing to the topography there is a great diversity of climate in

WASHINGTON

Washington. The Cascade and Olympic Mountains and the great plateau or elevated plain of the Columbia play the most important parts in causing this diversity. The Cascade range divides the State into two distinct climatic zones, in which there is little similarity of climate. In the eastern section the climate is dry or semi-arid. The seasons are four, spring, summer, autumn and winter. The average annual rainfall varies in different localities, ranging from 6.50 inches at Pasco to 18.25 inches at Spokane and 24.90 inches at Dayton. The mean January temperature ranges from 22° to 30° in different localities, according to the elevation, and the mean August temperature ranges from 65° to 74°. The highest temperature on record at Yakima, which is a fair average, is 108°, and the lowest is 22° below zero. The climate of the whole of the eastern section is remarkable for its brightness and clearness. The winters are short, and although the days are often hot in summer, the nights are cool and delightful.

In western Washington the climate is equable, with no extremes of heat and cold. Only two seasons are spoken of,—summer and winter. The summers are cool or moderately warm, and the winters are mild and rainy with almost no snow, except on the mountains. In summer the temperature rarely reaches 90°, and in winter it never goes as low as zero. At Seattle, which is a fair average for western Washington, the annual mean temperature is 51.4°, ranging from 40.6° in January to 64.7° in August. The average high temperature is 74° in July and 70° in August, and the average low temperature is 43° in December and 38° in January. The rainfall in western Washington varies greatly in different localities owing to the mountain ranges and prevailing winds. The heaviest precipitation occurs on the coast of the Pacific Ocean and gradually decreases as it proceeds inland around the south side of the Olympic Mountains and down the Puget Sound basin. The annual rainfall averages 89.27 inches on the coast at South Bend; 52.65 inches at Olympia; 43.88 inches at Tacoma; 37.34 inches at Seattle, and 22.42 inches at Port Townsend. While winter is called the rainy season and summer the dry season, it should be understood that every month in summer has some rainy days and that there is considerable clear weather during the winter months. For a period of ten years, during the months of December, January and February, the average number of days per month with precipitation to the amount of .01 of an inch has been from 15 to 19, and the average precipitation per month about five inches; the average number of rainy days in July and August for the same period has been five, the average precipitation has been about one inch each month, and the average number of rainy days has been 162 per year. Thunder and lightning are of rare occurrence and violent wind storms are entirely unknown.

Geology.—Metamorphic rocks occupy a large portion of the State, being of very frequent occurrence throughout the region of the Cascade Mountains and the Okanogan Highlands. The most important varieties of these rocks are gneiss, schist, marble, slate and quartzite. Granite is found in many localities in very large quantities. Crystalline limestone also occurs in a number of places, particularly in the Puget Sound basin. The most important volcanic rock

in the State is the basaltic rock of the Columbia plain, which not only extends over a large portion of Washington, but also covers all of southern Idaho, eastern Oregon and north-eastern California. Sedimentary rocks cover a large portion of the State. The rocks of the Tertiary period are the best known, and are of great economic importance on account of the large deposits of coal and building stone which they contain. The Eocene rocks are nearly all coal-bearing. Pleistocene sediments, in the nature of glacial deposits, occur in the western and northern parts of the State. In all of the mountainous districts, except the Blue Mountains, glacial deposits are found, and the valleys are largely occupied by deep terraces and moraines. The glacial deposits of the Puget Sound basin consist of till, with stratified sand, clay and gravel, in all averaging not less than 500 feet in thickness.

Soil, Agriculture and Irrigation.—There are about 40,000 square miles of forested land in the State, the trees being mostly conifers, with some oak, maple, cottonwood and other deciduous varieties. Nearly all of the western section of the State was originally covered with forests, while in the eastern section the forest areas are confined principally to the slopes of the mountains and the highlands. The soil in western Washington consists largely of glacial drift, being a mixture of sand, gravel and clay upon the uplands, which is very productive when properly handled. In the lower lands there are large areas of sandy loam and semi-peat lands, rich in organic matter, which are very fertile, and grow all kinds of crops that thrive in a porous soil.

In eastern Washington the soil has been formed by the disintegration of basaltic or lava rocks. It is of a dark color, of fine texture, and contains no gravel and very little sand. It is what might be termed a clay loam. It has been stated by eminent authorities that this is the best wheat land in the world, a statement which is proved by the enormous crops produced each year. The higher lands of the Columbia plain are devoted principally to the cultivation of wheat, which is the most important agricultural product of the State. The annual crop of wheat averages about 30,000,000 bushels, and the average yield per acre is about 26 bushels.

In the lower lands of the eastern section the rainfall is insufficient to bring crops to maturity, and irrigation is carried on to a considerable extent with great success. There are now about 150,000 acres of irrigated lands under cultivation, and nearly 100,000 acres more under ditch and ready for cultivation. Numerous irrigation projects are in progress which will result in the reclamation of at least 1,000,000 acres within the next few years. The irrigated lands produce wonderful crops of fruits, vegetables, hay, hops and grain. The climate is very favorable and a great variety of apples, peaches, plums and kindred fruits are raised in great abundance, together with grapes, strawberries, blackberries, raspberries and other small fruits of every kind. The fruits raised in eastern Washington are beautifully colored and of most excellent flavor. The soil of the irrigated section is admirably adapted to the cultivation of all kinds of vegetables, and especially to the cultivation of potatoes, of which large quantities are produced each year. Alfalfa is one of the chief forage

WASHINGTON

plants, producing three or four crops during the season and yielding from 5 to 8 tons of hay per acre. Timothy, clover and other grasses are also raised quite extensively. Hop raising is an important industry, the average crop being 3,500,000 pounds per year. All kinds of cereals are also cultivated to some extent. The Okanogan Highlands and the slopes of the Cascade Mountains furnish extensive ranges for cattle and sheep, which are raised in large numbers. With the settling up of the country, however, the ranges are becoming more restricted year by year, and, as a consequence, domestic methods of stock raising are being adopted with a resulting yearly increase in production.

In western Washington diversified farming, dairying and fruit raising are the principal agricultural pursuits. This section of the State is admirably adapted to the dairying industry owing to the rich soil and the moist, warm climate, which combine to produce an abundance of nutritious grasses, hay, and other stock food, and excellent water. The home market is one of the best in the world, on account of the large population, engaged in manufacturing, lumbering, fishing and mining, and the trade with Alaska. There are 345 creameries and condensed milk factories in the State. All kinds of stock do well in this section and large numbers of horses and hogs are raised. The breeding of Angora goats has also been undertaken with marked success and is becoming an important industry. Hop raising is carried on quite extensively in the river valleys, the average crop being about the same as in eastern Washington; considerable small grain is raised in this section, especially upon the flat lands along the shores of Puget Sound.

Lumbering.—The greatest industry of the State is the manufacture of lumber and shingles. There are in the State 419 lumber mills, with a daily capacity of 26,000,000 feet, and 441 shingle mills, with a daily capacity of 42,000,000 shingles. There are also more than 300 logging camps and a number of planing mills and wooden-ware factories. These mills, factories and camps employ more than 30,000 men; the annual pay roll amounts to \$20,000,000, and the value of the product is about \$35,000,000 annually. The capital employed in lumbering amounts to about \$40,000,000. In 1903 there were 42,701 cars of lumber and 35,764 cars of shingles shipped from the State by rail and 770,057,846 feet of lumber shipped by water. The rail shipments of lumber amounted to 640,515,000 feet, making the total shipments for the year 1,410,572,846 feet, and the number of shingles 5,722,240,000. In addition to the lumber shipped out of the State a large quantity is used in making local improvements. The quantity of timber used by the mills in 1903, aggregated nearly 2,000,000,000 feet board measure. In 1902, the United States Department of the Interior caused an estimate of the quantity of merchantable timber in the State to be made, which shows the total to be 195,237,000,000 feet, board measure. The most valuable tree of the State is yellow fir (*Pseudotsuga Douglasii*), which comprises nearly one half of the merchantable timber. The next most valuable is the red cedar (*Thuja gigantea*), used extensively in the manufacture of shingles. Western hemlock (*Tsuga mertensiana*), yellow pine (*Pinus ponderosa*), sugar pine (*Pinus*

lambertiana), spruce (*Picea sitchensis*) and western larch (*Larix occidentalis*), are also valuable commercial varieties. At the present rate of consumption, the amount of standing timber will supply the mills of the State for at least 100 years.

Mining.—Coal is first in importance in the mining resources of the State. The greatest deposits are found in the Puget Sound basin, and on the eastern slopes of the Cascade Mountains in Kittitas County. The coal fields are very extensive and practically inexhaustible. The veins vary from 5 to 25 feet in thickness. The quality ranges from a rich bituminous coking coal to brown lignites. Deposits of anthracite have also been discovered in the vicinity of Mount Rainier. There are 23 mines in operation, employing about 5,000 workmen. The aggregate output during the year 1903 was 3,190,477 tons of coal and 77,916 tons of coke. The mines of Washington and British Columbia practically supply the Pacific Coast States and Alaska with coal.

There are large deposits of iron ore in the Cascade range and in the Puget Sound basin. Brown hematite ore is found along the Skagit River and is worked to some extent. Magnetic ore is found in King County and bog ore occurs in several localities. Copper and lead are found in the Cascade Mountains and the Okanogan Highlands.

The precious metals are found in several localities, and sufficient development work has been done to prove the existence of mines of great value. In the northeastern part of the State, the mines have been worked on quite an extensive scale. The prevailing country rock, in that district, is limestone and the principal mineral is argentiferous galena. Gold has been discovered in many places throughout the whole extent of the Cascade range and in the Okanogan Highlands.

Fisheries.—Salmon fishing is one of the important industries of the State, and her brands of canned salmon are known in every market in the civilized world. The capital invested in the industry exceeds \$6,000,000; the number of persons employed is about 10,000 and the wages paid amount to more than \$3,000,000 annually. The value of the yearly product of the canneries ranges from \$5,000,000 to \$8,000,000 according to the run of fish, and the value of the fresh, salted and smoked product, will amount to about \$1,500,000 more each year. There are 45 salmon canneries in the State. The propagation of salmon was undertaken by the State in 1895, and since that time 18 hatcheries have been established with a capacity of from 4,000,000 to 8,000,000 fish each per season. This work has been very successful, and has resulted in quite an increase of the supply of salmon. In addition to the salmon industry, the cod, halibut, mackerel and herring fisheries on the banks off the coast of Washington and Alaska give employment to a large number of men. Large quantities of halibut are shipped to the Atlantic coast cities in refrigerator cars, and that line of fishing has developed into an important industry. Oyster culture is also carried on to quite an extent in the shallow waters of Puget Sound and Willapa Harbor. Clams, crabs and shrimp are abundant, and many kinds of game fish are found in the streams and fresh water lakes.

WASHINGTON

Game.—There is a great abundance of large and small game in Washington. Deer are found in all sections, elk abound in large numbers in the Olympic Mountains and to some extent in the Cascades. Mountain goats are numerous on the higher ranges of the Cascades. There are a few mountain sheep on the lofty mountains. Black bears, panthers and wildcats are common. Waterfowl, pheasants, quail, prairie chickens and several kinds of grouse are plentiful.

Manufacturing.—When the census of 1900 was taken, there were 3,631 manufacturing establishments reported in this State. The amount of capital invested was \$52,649,760; the number of persons employed, including clerks and members of firms, was 40,154; the amount of wages and salaries paid was \$21,270,897, and the value of the products was \$86,795,051. The largest manufacturing industries consist of lumber mills, flour and grist mills, shipyards, iron works, paper mills, smelters, breweries, fruit and vegetable canneries, furniture factories, pottery and terra cotta works, creameries and condensed milk factories. Since 1900, manufacturing has increased very rapidly. Many new industries have been established and old ones have been greatly extended in order to keep pace with the growing markets. A careful estimate indicates that there has been an increase of at least 50 per cent since the census was taken. There are about 60 flour mills in the State, producing more than 2,000,000 barrels of flour per annum, which is marketed very largely in the countries of the Orient. Shipbuilding is carried on at a number of localities on Puget Sound and at Gray's Harbor. The Puget Sound Navy Yard and Moran Bros. Company's Works at Seattle, are equipped for the construction of all kinds of ships and boats. The battleship Nebraska is now (1904) under construction at the last named yard. Among the ship-building States, Washington stands fourth as to the number of vessels constructed, and tenth as to the volume of tonnage. A large proportion of the ship-building of the State is the construction of wooden sailing vessels and steamers of various types. The superiority of Washington fir for use in ship construction is recognized in all parts of the world, on account of its great strength and the length of clear timber obtainable. The manufacture of iron and steel has just been begun. One small blast furnace has been established on Puget Sound which produces a high grade of pig iron. With an abundance of raw materials, easily assembled at low prices, and with a large market for the product, the manufacture of iron and steel promises to become one of the leading industries of the State.

Nearly all of the rivers of the State are mountain streams, with a large flow of water at all seasons of the year, and many rapids and falls, which, under modern methods of transmission are capable of supplying power, for all industrial purposes, at a very low cost and in almost unlimited quantities. Large power plants have already been installed on the Snoqualmie and Puyallup rivers. The city of Seattle is constructing a plant upon the Cedar River, to supply the municipality with light and power for both public and private purposes. Several other plants are in the course of construction in the vicinity of the larger cities.

Transportation.—Washington is well pro-

vided with transportation facilities, both by water and by railroad. The rivers, lakes, Puget Sound with its numerous arms, bays and inlets; the Strait of Juan de Fuca and the Pacific Ocean, make all parts of the western section, and many parts of the eastern section of the State easily accessible by boats. There are about 2,700 miles of railroad in the State, not including the electric roads. The chief systems are the Northern Pacific, Great Northern, Oregon Railway and Navigation Company, Pacific Coast Company, Spokane Falls & Northern and the Bellingham Bay & British Columbia Railroad. The Burlington system and the Canadian Pacific also reach Puget Sound under a traffic arrangement with the other roads. Electric railways are now in operation from Seattle to Tacoma and to Renton. Another line is under construction from Seattle to Everett, and a number of other lines are projected.

A large fleet of steamers is operated upon the waters of Puget Sound carrying freight and passengers in the local traffic. Several steamship lines are operated between Seattle, Puget Sound and Alaska, British Columbia, California and the Orient, and between Gray's Harbor and San Francisco. In addition to the regular lines of steamships a large commerce is carried on by means of sailing vessels and itinerant steamships.

Commerce.—During the fiscal year ending 30 June 1903, 2,067 vessels, aggregating 1,187,768 tons, entered, and 2,192 vessels, aggregating 1,340,739 tons, cleared in the foreign trade of the Puget Sound Customs District, which includes all of the ports of the State of Washington with the exception of the Columbia River. The value of the imports was \$12,177,243, and the value of the exports was \$32,499,828. During the past decade the foreign commerce has increased very rapidly. In 1893 the imports amounted to only \$839,709 and the exports to \$5,093,436. A very large commerce is carried on between Washington and the other Pacific Coast States, Alaska, Hawaii and the Philippine Islands, and the receipts in this trade average \$30,000,000 and the shipments \$40,000,000 per annum.

Education.—There are 2,407 school districts in the State, in 285 of which, schools of more than one department are maintained. In 1903, the total number of children of school age was 183,432 and the attendance at the schools was 149,750. The reports of the State superintendent of public instruction show that 4,159 teachers were employed. The amount expended for teachers' salaries, buildings and running expenses for 1903 was \$3,658,117. The value of all school property, exclusive of school lands, was \$7,700,060. The average length of the school sessions in the country districts is six months. In the towns and cities the sessions are usually ten months. Nearly every town of from 1,500 upward has a high school with a three or four year course. In a number of places several country districts have combined to form a union high school district. The number of students in attendance at high schools in 1903 exceeded 6,000. For higher education the State maintains the University of Washington, at Seattle, with 42 instructors and enrollment of 631 students; the Agricultural College and School of Science at Pullman, 49 instructors, 568 students; and Normal schools at Cheney, 12 instructors,

WASHINGTON

198 students; Ellensburg, 11 instructors, and 145 students; and Bellingham, 20 instructors and 355 students. There are 34 private academies and colleges which reported to the State Superintendent in 1903, and a number of others which failed to report. The leading private colleges are Whitman College at Walla Walla; Whitworth College, Tacoma; Gonzaga College, Spokane; Puget Sound University, Tacoma; Vashon College, Burton, and Colfax College, Colfax.

Charitable, Reformatory and Penal Institutions.—The State maintains an institution for the care and education of the blind, deaf and feeble-minded; a reform school for juvenile offenders; a penitentiary; two hospitals for the insane and a soldiers' home. The school for defective youth is located at Vancouver and is properly divided into three branches, namely: for the deaf, the blind, and the feeble-minded. The reform school is located at Chehalis. This institution has a farm and shops of various kinds where boys and girls are taught useful trades. The penitentiary is located at Walla Walla. In this institution there is a jute mill and a brick yard which give employment to a large number of the inmates. The Western Washington hospital for the insane is located near Steilacoom, and the Eastern Washington hospital is located at Medical Lake. The soldiers' home is located at Orting. All of these State institutions are under the general supervision and management of a board consisting of three members appointed by the governor, known as the State Board of Control.

Banks and Finance.—There are in the State 34 national, 88 state and 46 private banks, with a combined capital of \$8,128,000 and individual deposits on 1 April 1903, amounting to \$78,226,790. The total valuation of real and personal property in the State in 1903 was \$276,988,569, and the State tax levy 7.585 mills.

Government.—The State officers are as follows: governor, lieutenant-governor, secretary of state, treasurer, auditor, attorney-general, superintendent of public instruction, and commissioner of public lands, who are elected for terms of four years. The legislature of the State has biennial sessions and consists of a Senate and House of Representatives. There are 42 members of the Senate, one half of whom are elected every two years to hold office for terms of four years. The House of Representatives consists of 94 members, elected biennially for terms of two years. The judicial department is divided into a supreme court and superior courts. There are five judges of the supreme court, whose terms are six years, and 25 judges of the superior courts, elected for terms of four years. The whole State is under county organization, the affairs of each county being administered by a board of county commissioners consisting of three members. The State is represented in Congress by two senators and three representatives.

Population and Divisions.—As shown by the United States census reports, the population of Washington was 11,594 in 1860; 23,955 in 1870; 75,116 in 1880; 349,390 in 1890, and 518,103 in 1900. The State Bureau of Statistics reported the population as 759,687 in June 1903.

There are 36 counties in the State which, with their county-seats, are named as follows:

Adams, Ritzville.
Asotin, Asotin.
Chehalis, Montesano.
Chelan, Wenatchee.
Clallam, Port Angeles.
Clarke, Vancouver.
Columbia, Dayton.
Cowlitz, Kalama.
Douglas, Waterville.
Ferry, Republic.
Franklin, Pasco.
Garfield, Pomeroy.
Island, Coupeville.
Jefferson, Port Townsend.
King, Seattle.
Kitsap, Port Orchard.
Kittitas, Ellensburg.

There are 59 places in the State of over 1,000 population; 28 of over 2,000; 9 of over 5,000, and 5 of over 20,000. The metropolis is Seattle, on Puget Sound, with 121,813 inhabitants. Tacoma, 52,799; Spokane, 47,902; Bellingham (being Whatcom and Fairhaven, consolidated 1903), 22,000, and Everett, 20,138, are the other cities with more than 20,000 people. All of the cities named are important commercial and manufacturing centres, and all, except Spokane, are situated upon Puget Sound.

Indians.—According to the Annual Report of the Commissioner of Indian Affairs there are 10,019 Indians living upon the 12 reservations in the State. The reservations contain 2,333,574 acres of land. The largest reservations are the Makaw and Quinault reservations on the Pacific Coast, the Tulalip and Puyallup reservations on Puget Sound and the Yakima, Colville and Spokane reservations in eastern Washington. There is also quite a large number of Indians who do not live upon the reservations. Many of them are engaged in agriculture, and a considerable number work in the logging camps and fisheries.

History.—The first record in history of the region which is now the State of Washington, was the discovery, in 1592, of the Strait of Juan de Fuca by a Greek pilot of that name in the service of the Viceroy of Mexico. In 1775, a Spanish navigator, Captain Bruno Hequeta, sailed along the coast and discovered the mouth of the Columbia, and was unable to enter the river. In 1792, Captain Robert Gray, a New England navigator, sailed up the North Pacific coast on a voyage of exploration and on 11 May, he discovered the mouth of the Columbia, sailed into the river, explored it for about 15 miles and gave it the name of his ship. It was this discovery and the exploration that gave the United States their strongest claim to the territory drained by the Columbia, which was known as the "Oregon Country." In the same year Captain George Vancouver of the British navy, explored the waters of Puget Sound. During the next few years, a number of other navigators visited the coast and it soon became quite well known. The first overland exploration was the expedition of Lewis and Clark of the United States army in 1805-6. This expedition, sent out by President Jefferson, traversed the Mississippi Valley, crossed the Rocky Mountains, and followed the Columbia River to its mouth, where they spent one winter. The next military expedition was that of 1843 under Captain John C. Frémont, which reached Vancouver on the Columbia. The first United States Naval Expedition was the exploration of Puget Sound by Captain Charles Wilkes in 1841. The first white

WASHINGTON

people to settle in Washington were the traders of the Northwest Fur Company, who established posts in eastern Washington in 1811. The next white settlement was established by Dr. Marcus Whitman in 1836, near the site of the present city of Walla Walla. The first settlement in western Washington was at Tumwater on Puget Sound, in 1845. The ownership of the country north of the Columbia River was claimed by both Great Britain and the United States until 1846, when, under the Buchanan-Pakingham treaty, Great Britain took all the territory north of the 49th parallel, and the United States all of the territory south of that parallel, except the south end of Vancouver Island. The American territory was organized as the Territory of Oregon, 14 Aug. 1848. On 2 March 1853, that portion lying north of the Columbia River and the 46th parallel was organized as the Territory of Washington. With the discovery of gold in eastern Washington, a great increase of population followed, and the Indians becoming alarmed for their hunting grounds, resolved to exterminate the whites. This led to the Indian war of 1855-6, and there were still further troubles with the Indians in 1857, at the time of the rush to the gold fields of British Columbia, but the greatest rush was after the discovery of gold at Salmon River in 1860. At the time of the treaty between Great Britain and the United States in 1846, the 49th parallel had been accepted as the boundary to the channel between Vancouver Island and the mainland, and thence down that channel to the sea. In 1859 a dispute arose as to which channel was meant, and this was not settled until 1872, when the claims were referred to arbitration and decided by the German emperor in favor of the United States. On 22 Feb. 1889, Congress passed an enabling act providing for the admission of the State of Washington into the Union. The State Constitution was adopted and ratified by the people, at an election held 1 Oct. 1889, and on 11 Nov. 1889, in accordance with the provisions of the enabling act, the President of the United States proclaimed the admission of the State of Washington into the Union. There were 14 governors of the Territory, of whom Isaac I. Stevens was the first. In addition to his duties as governor, he had charge of the survey for a railroad route from the Mississippi River to the Pacific, and was also Superintendent of Indian Affairs for Washington. The first territorial legislature met at Olympia 27 Feb. 1854. Since her admission to the Union the State has had four governors, namely: Elisha P. Ferry, Rep. (1889-92); John J. McGraw, Rep. (1893-6); John R. Rogers, Dem. (1897-1901); Henry McBride, Rep. (1902-4). Governor Rogers died in office and was succeeded by Governor McBride, who was elected as lieutenant-governor.

The growth of the population of Washington was very slow until the advent of the first railroad in 1884, on account of its remoteness and the difficulty of reaching it from the Eastern States. Since that time the development of the country has been phenomenally rapid. The establishment of regular steamship lines between Puget Sound and the countries of the Orient, the trade which has grown up as a result of the great discoveries of gold in Alaska and the Yukon territory in 1897, and the development of commerce between this State and the new

island possessions in the Pacific Ocean, are some of the leading factors which have caused the wonderful progress of the past few years.

JAMES B. MEIKLE,
Secretary Seattle Chamber of Commerce.

Washington, Ark., town, county-seat of Hempstead County; on the Arkansas & Louisiana Railroad; about 110 miles southwest of Little Rock. It is in an agricultural region, and its industries are connected chiefly with farm products. It has considerable trade, especially in the shipments of grain, vegetables, cotton, and tobacco. Pop. about 1,000.

Washington, Conn., town in Litchfield County; on the Shepaug River; about 90 miles northeast of New York and 38 miles north of Bridgeport. It contains the villages of Marbledale, New Preston, Woodville, Washington, Washington Depot, and Romford. Its industries are connected with farm products and caring for guests in summer, as it is a favorite summer resort. Pop. (1890) 1,633; (1900) 1,820.

Washington, D. C. The District of Columbia was established under the authority and direction of the acts of Congress approved 16 July 1790 and 3 March 1791, which were passed to give effect to a clause of the Constitution of the United States giving Congress the power: "To exercise exclusive legislation in all cases whatsoever over such district (not exceeding ten miles square) as may, by cession of particular States and the acceptance of Congress become the seat of the government of the United States." The territory obtained for this purpose lies in lat. 38° 53' to 38° N., lon. 76° 58' to 77° W. from Greenwich. Originally 10 miles square, with the southern and part of its western extremity in the State of Virginia, it, through recession of the territory received from that State, became reduced in area to 69¼ square miles made up of what was once a part of Maryland. The site of the District of Columbia is at the confluence of the Potomac and the Anacostia or Eastern Branch rivers, 100 miles from Chesapeake Bay and 185 miles from the Atlantic Ocean. It rises from tide water lowlands at the rivers' banks through a series of hills to an extreme elevation, in some sections, of 400 feet. The District, as it is constituted, in former times comprised the villages of Washington and Georgetown, both of which are now included in the great federal city of Washington, whose government is unique.

The President of the United States and the two houses of the Congress are to this city what the mayor and council are to other cities. The administration of municipal affairs is vested in three commissioners appointed by the President and acting under the sole authority of Congress. One half of the expenses of the government are paid from the revenues of the District and the other half by the United States. The assessed valuation of all the property in the District in 1903 was \$497,157,266; of this amount taxes were paid on \$213,250,418; \$264,156,956, more than one half of the total amount of the assessed valuation, was exempt from taxation because it is owned and controlled by the government of the United States. The appropriations for the expenses of the District for the fiscal year ending 30 June 1904 amounted to \$9,088,554.67, of which amount \$4,619,964.44 was paid from the

WASHINGTON

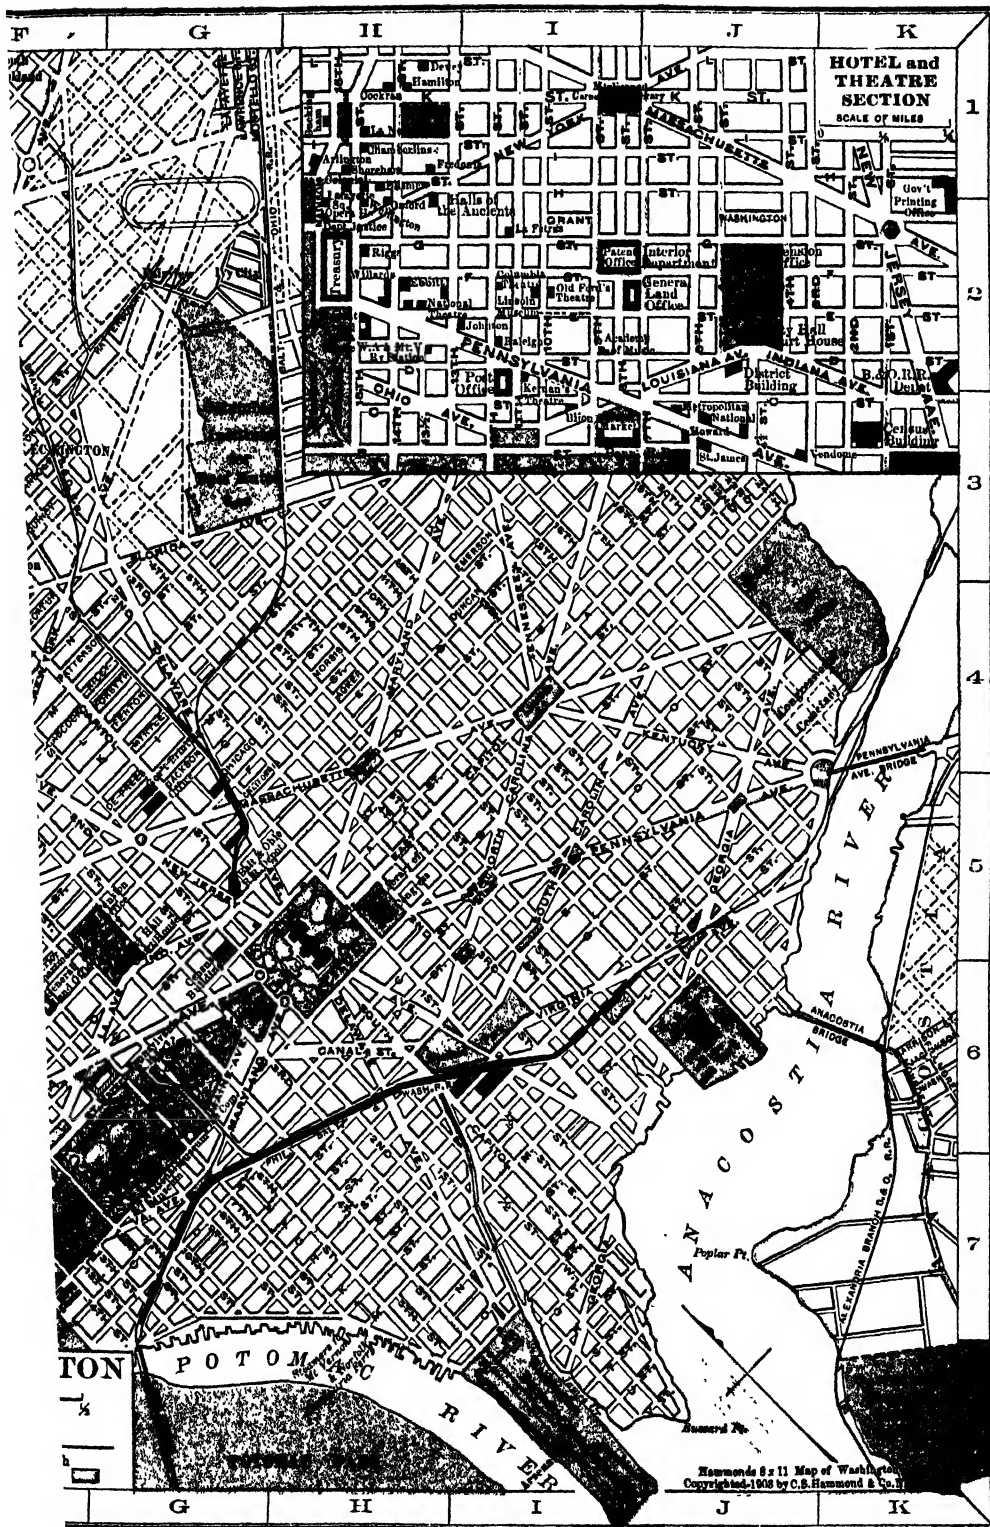

revenues of the District. The estimated population in 1902 was 289,596, including 200,477 whites and 89,119 negroes. The death rate for the same year was 19.986; 15,922 among the white people and 29.129 among the negroes. The birth rate for 1902 was 17.031; 15,393 among the whites and 20.714 among the negroes. The estimated population in 1903 was 295,193; white 204,840; negroes 90,353. The climate is excellent. The mean average annual temperature for 33 years being 55 degrees; average summer temperature for the same period, 75; average winter, 35. The city is reached by six railroad lines, the Pennsylvania, and Baltimore & Ohio, from the north and west, the Chesapeake & Ohio from the west, the Southern, Seaboard Air Line and Atlantic Coast Line from the south, and by steamboat from Baltimore on the north and Norfolk on the south.

History.—By act of Congress in July 1790 a commission of three, with President George Washington at its head, was given authority to select on the Potomac River at some place between the mouth of the Eastern Branch and the Conococheague, a site, not to exceed 10 miles square, for a permanent capital of the United States. Within three days after the passage of the enabling act Washington announced the selection of the present site of the city which bears his name. The original acts of Congress relating to the District referred to it as the Seat of Government. Washington called it the Federal City, and the commission which had charge of it after the death of the first President knew it as the City of Washington in the Territory of Columbia. Congress finally accepted the name of Washington for the city and called the territory surrounding and including it, which was gained by cession from the States in which it lay, the District of Columbia. Major l'Enfant, a French engineer serving in the Continental army, who was employed to superintend the laying out of the city, followed plans outlined by Washington, derived, it is believed, from the outlines of Versailles, France. Washington and l'Enfant frequently rode over the site of the city together and the plans they decided upon were afterward developed and carried out, as far as they could be, by Andrew Ellicott, a Pennsylvania engineer, who was employed on the work after l'Enfant—thoroughly discouraged because of obstacles placed in his way by unsympathetic commissioners—had resigned his position. The scheme of the city as originally decided upon, made the Capitol building, located on the western edge of a high plateau, the point from which most of the streets and avenues radiated. Straight lines run through the centre of the building, north and south, east and west, divided the city into four sections known respectively as northwest, northeast, southwest and southeast. The streets were run with practically unswerving accuracy parallel to the marks of division, those streets running east and west being lettered and those north and south numbered. The avenues were planned to intersect the streets at various angles. The streets which followed the dividing lines were known as North Capitol, East Capitol and South Capitol; the western line running through a great expanse of parking directly to the Potomac River from the Capitol. This parking reservation, or series of parks, was called the Mall and was designed to be the most beautiful

section of the city, with the public buildings erected along the northern and southern sides. The cornerstone of the Capitol building, the first public edifice to be erected, was laid 18 Sept. 1793. The seat of government was removed from Philadelphia in 1800, and in November of that year the national legislature met in Washington for the first time. At the outset Congress placed city affairs in the hands of three commissioners; but, not pleased with the results of the experiment, in 1802 the city of Washington was made a corporate town with a mayor, a board of aldermen and a common council. The first mayor was appointed by the President, but all the later incumbents of the mayoralty were elected to office by the people. Georgetown and Alexandria, towns which existed prior to the Revolution, and which were included in the Federal District when that was originally laid out, remained corporate towns with independent municipal governments. In 1814 the city was captured by an expeditionary force of British soldiers and all the public buildings, including the Capitol and the White House, were destroyed by fire. During the first 70 years of its existence as the capital of the United States, Washington was apparently nothing more than one of the most forlorn of villages. No serious effort was made toward ordinary municipal betterment. The United States paid no taxes on the property it held and only made the smallest appropriations for maintenance of the capital city. This lack of public spirit lost to the District the Virginia territory which was ceded to that State on the petition of the citizens of Alexandria in 1846. The creation of a territorial form of government in 1871 which brought the whole District under Federal control again marked the beginning of the era of improvement which is even now progressing. The board of public works, established coincident with the creation of the territorial government, originated and pushed the great public improvements despite the obstacles it faced in the shape of the prejudices of the people. The city was cleaned and renovated; those lines of the Washington-l'Enfant plans which had been ignored or obliterated were re-established and the foundations of the Washington of to-day were laid. The city was left in such a state that when the present form of government was adopted the work was continued as an absolute necessity. Dissatisfaction with the territorial government developed, however, and after experimenting four years the present system was finally established by an act of Congress on 11 June 1878.

Government and Relations with the General Government.—The District of Columbia now enjoys a unique form of government which is seemingly at variance with all republican principles and yet which reflects, as does nothing else in the United States the idea of a "government for the people, of the people, and by the people." The citizens of the United States rule their capital city. The people of the capital have no part in it. Three commissioners, one from each of the two dominant political parties and one an officer of the engineer corps of the army, are appointed by the President, with the "advice and consent of the Senate," to administer the affairs of the District for terms of three years each. These officials are paid \$5,000 per year for their work. The salary of the engineer

WASHINGTON

officer detailed for the work is made to equal this amount by additions to his regular pay. All subordinate officers of the government are appointed by the commissioners. Two assistants from the corps of engineers of the army are detailed with the engineer commissioner. The other members of the triumvirate have no assistants. There are two sets of laws in force. One, acts of Congress, corresponding to State laws in other communities; two, municipal regulations enacted by the board of commissioners, taking the place of the municipal laws of other cities. The commissioners have no power to appropriate the money used in the government. Every cent is appropriated specifically by Congress. An annual report is made to the Congress through the President, which contains the annual report of all subordinate officers of the government. The Congress determines upon all public improvements, through committees of each house appointed for the purpose. Nothing can be done, not even so little a thing as the purchase of a box of friction matches, without authority from the Congress. The expenses of the District government are paid, one half from the revenues of the District and one half from the treasury of the United States. The revenues of the District are derived from taxes on real and personal property and licenses of various sorts. The levying of the taxes is in the hands of an assessor who has subordinate to him a board of assistant assessors and a board of personal tax assessors, together with such license clerks, etc., as are necessary to carry on this part of the business of the government. A collector of taxes has charge of the collection of all taxes and license fees. The accounts are audited by an auditor who has an assistant and a large force of bookkeepers, accountants, etc. The police power is vested in a police department consisting of one major and superintendent, one captain and assistant superintendent, four captains and aids to the superintendent, 10 lieutenants who have direct control of the policemen, 35 sergeants, and 642 privates. The city is divided into 10 police precincts, each presided over by a lieutenant. The judiciary of the District includes one supreme court, a court of appeals and a police court. The supreme court of the District includes one chief justice, five associate justices, and one United States marshal. It is so divided into criminal, equity, circuit and probate courts that it transacts in this jurisdiction the same business as that which is accomplished by the Federal, State and municipal courts of other localities, the members of the bench alternating in the various branches. The court of appeals has one chief justice and two associate justices. This court hears appeals from the District supreme court and also from the commissioner of patents. The police court consists of two branches, each presided over by a police justice. One branch attends to violations of the municipal regulations and the other to infractions of United States laws. In all the courts, but the last named, the justices are appointed by the President for life terms. In the police court the justices are appointed for terms of four years each. Connected with the supreme court there is a register of wills and a recorder of deeds. The maintenance of true lines of streets, etc., is charged to the surveyor's office, which includes in its force one surveyor and his assistants, all under the control of the

engineer commissioner. The sanitation of the city is under the charge of a health officer who has a deputy and numerous inspectors. A superintendent of street cleaning, assisted in the work by about 400 men, has charge of the cleaning of the streets, much of which is done by the hand cleaning system. The city fire department consists of one chief engineer, four assistants, one fire marshal, one machinist, 14 steam engine companies, five chemical engine companies and six truck companies, each of the detachments or companies being under the control of a foreman and one assistant. There is an engineer department under the direct control of the engineer commissioner. The divisions of city government enumerated above, together with the other subordinate departments, are presided over by the two civilian commissioners, each having his special departments for control and observation. It requires, however, a majority vote of the whole board to determine any question of policy in carrying out the acts of Congress relating to the District. The Congress exercises a most jealous care of the District. Its appropriations are made separate and distinct for every department of the municipal structure, the smallest items being provided for specifically. In addition to going through the hands of the auditor for the District they are carefully scrutinized by the auditor for the State and other departments and the comptroller of the treasury. All money is disbursed by an officer appointed for the purpose by the commissioners. This officer has no connection with any of the other departments. A handsome municipal building for housing all branches of the city government is now (1904) about to be constructed at a cost of \$1,500,000. The water supply of the District comes from the Potomac River at a point about 15 miles above the city. It is carried through an aqueduct from the river to large storage reservoirs and from these is pumped into the city. A filtration plant is under construction near Soldiers' Home, which will cover 20 acres of ground and will be sufficient to filter all the water used in the city. The water is of excellent quality, free from impurities, although at times it is very muddy. It is drawn from the mountain streams of the Alleghenies which empty into the Potomac in the Cumberland Valley. The water supply with everything relating to it is under the charge of the United States government, by which it is owned. A nominal water rent is charged consumers.

Education.—The public school system of the District is said to be the finest in the United States. It is under the control of the commissioners through a board of education composed of seven members. The administration of the affairs of the schools is all in the hands of this board, which is made up of prominent citizens who receive a nominal fee or salary. The head of the system is a superintendent, aided by two assistant superintendents who report to him and perform such duties as he assigns. There is a secretary who is the official representative of the board. The board makes requisition upon the commissioners for all expenditures. These must be approved by the commissioners, who also make all contracts for school supplies, the purchase of sites, and erection of buildings. The school system includes eight grades of primary and grammar schools and a high school course

WASHINGTON

with military instruction for the boys. At the end of his work in the graded schools a pupil may elect either an academic, a scientific, a business or a technical course in the secondary schools. After passing through four years in the academic high school a pupil may prepare himself for appointment as a teacher by a two years' course in the normal school. The total enrolment for the school year 1903-4 was 48,745, of which 32,987 were white pupils and 15,758 were colored. These pupils were enrolled in 1,023 schools divided as follows: normal, 170; high schools, 2,673; manual training schools, 816; grammar and primary schools, 43,310; kindergarten, 1,776. During the fiscal year ending 30 June 1902 the appropriation for the public schools was \$1,222,283.90. The enrolment for that year was 48,432, making the cost per pupil \$25.23. During the same year the number of teachers employed in the schools was 1,391 and the number of schools 983. Washington is also the seat of many universities, colleges, seminaries, academies and private primary schools. The Catholic University of America is situated in one of the northern suburbs of the District near the head of Lincoln Avenue. This institution was first organized in 1885 under the direction of the Catholic hierarchy of America, but was not actually established until the fall of 1889. It is one of the foremost institutions in the country for the study of the advanced branches of science and philosophy. The oldest institution of learning in the District is the Georgetown University, founded by Archbishop Carroll of Baltimore in 1789 and conducted under the direction of the Jesuit Order of the Roman Catholic Church. This University occupies a magnificent park on the heights above Georgetown and has all the departments of a modern university, with its law and medical schools located in the down town section of Washington. Connected with the medical school is a well equipped, modern hospital, located in Georgetown near the university proper. The oldest college or seminary for women is the Georgetown Convent, established also by Bishop Carroll, in 1798. It receives young women of the Roman Catholic faith and educates them in all the higher branches of learning. It also receives novices for the orders of sisterhood. Howard University, established by an act of Congress in 1867 and supported almost entirely by the government, furnishes opportunities for an education to the negro. This institution has medical, dental and law departments as well as the regular academic course. It also fits young men for the ministry and has a preparatory department. The Presbyterian Church has had much to do with its development, although the government makes annual appropriations for its maintenance and for the maintenance of the Freedman's Hospital, in connection with which the university medical department is operated. The Columbian University was chartered in 1821 and up to 1904 was under the direction of the Baptist Church. The sectarian clause in its charter was removed by act of Congress during the early months of 1904 and at the same time the university was given permission to change its name. The new title is the "George Washington University." It has about 200 officers of government and instruction and includes all the departments of a well-equipped university: legal, medical, dental, scientific, and collegiate. In ad-

dition to these the institution established a few years ago a school of diplomacy and jurisprudence in connection with its law school, and a modern well-equipped hospital in conjunction with its medical department. Trinity College, a Roman Catholic institution situated near the Catholic University of America, was formally dedicated in November 1900. It was designed for the higher education of women and is conducted by the Sisters of Notre Dame de Namur. The new Academy of the Visitation, on Connecticut Avenue between L and M streets, was established in 1850 as an offshoot of the Georgetown Convent. It is designed for the education of girls and is one of the best schools in the District. The Academy of the Holy Cross, another Roman Catholic institution of learning, primarily planned for the education of little girls, was founded in 1868 and is under the charge of the Sisters of the Holy Cross. The Christian Brothers conduct the Saint John's College, an institution that instructs young boys in the lower branches of learning and prepares them for college. Gonzaga College, carried on in connection with the Society of Jesus, is one of the finest preparatory schools in the country. It has a battalion of cadets and a band, all composed of students. The National University was established about 1870, the intention being to create a national institution on the lines recommended by George Washington. This university has no collegiate course, but has schools of law, medicine, dentistry, and pharmacy. Recently the medical and dental branches became a part of the Columbian University. The Columbia Institution for the Deaf and Dumb, known also as Gallaudet College, was incorporated by Congress 15 Feb. 1857. Amos Kendall, a prominent citizen of the District and a well-known philanthropist, had much to do with its organization. It is situated in a beautiful locality in the extreme northeastern section of the city of Washington. The first superintendent was Edward Miner Gallaudet, whose son is now its president. The school for the deaf in connection with the institution is known as the Kendall School. The collegiate department is named Gallaudet College in honor of the Rev. Thomas Hopkins Gallaudet. Congress makes an annual appropriation for the maintenance of the institution. The American University, yet in the course of organization, under the direction of the Methodist Church, promises to be one of the finest institutions of its kind in the country. This organization owns a large tract of land in the suburbs near Tenleytown, where it already has one building in the course of construction. Washington is peculiarly situated regarding scientific institutions. The numerous government bureaus bring to the city a vast concourse of eminent men of science. The most important of these institutions are the naval observatory, the Smithsonian Institution (q.v.), the geological survey, the coast and geodetic survey, the public health and marine hospital service, the national bureau of standards, the various bureaus of the department of agriculture, and the museums and laboratories of the army and navy medical departments. All of these bureaus or offices pursue the study and development of special branches of science and their libraries are among the most valuable, on the subjects considered, in the world. Connected with the Smithsonian Institution is the

WASHINGTON

National Museum in which is gathered a collection of subjects relating to the various branches of the sciences and to the history of the United States. Each is presided over by an eminent master of science and each offers an almost limitless opportunity for research. For the benefit of those who desire to engage in study along any of these lines, but who have not the means to accomplish their desires, an institution has been established, known as the Carnegie Institute, to which Andrew Carnegie presented \$10,000,000 with which to carry on the work. Washington possesses a public library, through the munificence of Mr. Carnegie, which cost \$300,000. Mr. Carnegie has also given a sufficient sum for the purpose of establishing branch libraries. The Library of Congress (q.v.) forms, perhaps, the largest institution of its kind in the United States. It is open to all the people, and is especially patronized by residents of the District. The Corcoran Art Gallery, a handsome structure containing copies and originals of famous works of art from all sections of the world, is closely related to, yet independent of, the educational institutions of the government. In addition to the Library of Congress each department of the general government has its library and there are also valuable libraries connected with the army and navy medical museums, the former being the best of its kind in the world. The law library of the Bar Association of the District is a very valuable institution, situated in the City-Hall, where the District Supreme Court is housed. Each departmental library contains volumes relating particularly to the work of that department.

The peculiar conditions governing Washington physically have their effect on its moral government. The humane institutions of the Capital City are divided into three classes. First, those supported entirely by the combined general and local government; next, those supported partially by the same government combination; and third, those maintained solely by private means. In the first class are the Washington Asylum, including the work house, an institution for correction, and the alms house with a hospital to which the sick of both these institutions are sent; the Municipal Lodging House; the Soldiers and Sailors' Temporary Home; the Soldiers' Home; the Board of Children's Guardians; the Industrial Home; Freedman's Hospital for Negroes, and the Government Hospital for the Insane. In the second class are the Columbia Hospital for Women, Children's Hospital, National Homeopathic Hospital, Providence Hospital, Garfield Hospital, Central Dispensary and Emergency Hospital, Eastern Dispensary and Casualty Hospital, Woman's Clinic, Washington Home for the Incurables, National Association for the Relief of Destitute Colored Women and Children, Working Boys' Home and Children's Aid Association, Washington Hospital for Foundlings, St. Ann's Infant Asylum, German Orphan Asylum, Woman's Christian Association, Young Woman's Christian Home, Florence Crittenton Hope and Help Mission, Aid Association for the Blind, Woman's Dispensary. The third class includes many institutions and associations which have for their object the caring for sick and incapacitated persons. Under this head come the two university hospitals, Georgetown and Columbian, and several charitable organizations.

The Government Hospital for the Insane, including a tract of several hundred acres of land, is situated on the south bank of the Eastern Branch. The institution was primarily designed for insane soldiers and sailors of the United States, but it receives beside these indigent insane persons of the District of Columbia. This is regarded as one of the foremost institutions of its kind in the country. A superintendent, appointed by the Secretary of the Interior, reports to the Interior Department annually as to the progress and condition of the affairs of the institution. A board of visitors, composed of prominent citizens of the country, has indirect supervision over the hospital and its surroundings. The second largest public institution conducted by the government is the National Soldiers' Home, situated in the suburbs north of the city. This institution furnishes a home for the soldiers of the regular army after retirement either through age or disability. It is governed by a board of army officers. The 502 acres which it occupies are fitted up with a number of handsome buildings, among which is a well-equipped hospital, presided over by a surgeon of the regular army. Washington has numerous private charities and institutions for charitable purposes in connection with the various churches and religious organizations. The charities of the District are superintended by a board of prominent citizens known as the board of charities; appointments to this board are made by the President of the United States.

Streets, Avenues, and Parks.—The wide streets and avenues and the numerous parks and parking spaces form the feature which most distinguishes Washington from other cities. Within the limits of the District there are 447.53 miles of paved streets of which amount 128.03 are asphalt and coal tar; 21.87 asphalt block; .52 vitrified brick; 27.34 granite block; 9.18 cobble stone; 71.36 macadam and 189.25 gravel. The gravel pavement is practically all in the parks and in the suburbs so that it cannot be taken as an indication of the treatment of the city streets. The mileage of asphalt streets is greater, it will be seen, than the mileage of all the other pavements, except gravel, put together. The distinctive feature is the slight use made of cobble stone in the pavements. Only 9.18 miles of street are paved in this manner and these are rapidly giving way to asphalt or asphalt block. The system of streets laid out by Washington, l'Enfant and Ellicott has been strictly adhered to. There are 21 avenues named after the various States. The streets and avenues are never less than 60 feet wide and vary from 60 feet to 160. Pennsylvania Avenue, which is the broadest street, is paved with asphalt almost its entire length, from the Eastern Branch to Rock Creek. Much of the property controlled by the United States is in public parks. Wherever an avenue intersects a numbered or lettered street the space between the avenue and street intersected, often an entire block in length, is converted into a public park. Many of these small parks are equipped with fountains and shrubbery and in all of them flowers are grown in huge masses during the proper seasons. These are under the direction of the superintendent of public buildings and grounds, an officer of the engineer corps of the army. The largest park in the city proper is called the Mall, which extends for about a mile and a half

WASHINGTON

from the Capitol building to the Potomac River and from B Street south to B Street north, giving it a width of four city blocks. It contains 230 acres. In the l'Enfant plan it was intended to improve this park by making a long vista or avenue, extending from the (then proposed) Washington monument to the Capitol, on the order of the Versailles gardens. This has never been done although recommended from time to time by architects and artists. The most recent recommendation was that of a distinguished commission of architects known as the park commission, appointed by the chairman of the Senate Committee on the District of Columbia to study the treatment of the parks in the capitals of Europe and to prepare a report as to what could be done in Washington. This report was presented to Congress in 1902, and provides for the expenditure of \$100,000,000 and the purchase by the government of all the property lying between Pennsylvania Avenue and the Mall on the north and between Maryland Avenue and the Mall on the south. Indications are that the plans, with some modifications, will gradually be adopted. The grounds surrounding the Soldiers' Home and in Rock Creek Park are the most extensive public reservations in the District. The former park is lined and interlined with drives of every sort. In the summer these are made most delightful by the great variety of foliage of the trees and the care taken in the cultivation of flowers and shrubbery. The Rock Creek Park, a vast tract of 1,775.9 acres acquired by the government during the last 20 years, is designed for a great national park. The government's zoological collection finds a home in one corner of this tract, which extends from the city limits to the District line and through which flows Rock Creek. The government owns most of the land for a considerable width along Rock Creek from the District line to the point where it empties into the Potomac near the western extremity of the Mall and the plans of the park commission provide for a system of driveways which will eventually connect Rock Creek Park with the Capitol building. The government has in the course of improvement a large tract of land known as Potomac Park, including a great area which has been reclaimed by dredging from the flats along the western and southern river front. This property is rapidly yielding to improvements which will make it one of the finest parks in the world. The Mall is connected with the parking surrounding the White House, the Treasury and State departments, by a reservation known as the President's Park or White lot, lying directly north of the Washington Monument. At points where two or three streets and avenues intersect, a small circular bit of parking is created, and in this, too, statuary has a place. This is shown by Lafayette Park, opposite the White House; Lincoln Park, at 11th and East Capitol streets; Garfield Park, between Third and Sixth and D and E streets southeast; Scott Circle, Thomas Circle, McPherson Square, etc. The parking about the Capitol building is very extensive and highly improved. Statues of Washington, Chief Justice Marshall and Garfield are found in and about this park. Statues of Scott, Farragut, Thomas, McPherson, Lafayette, Rochambeau, Jackson, Washington, and many other famous soldiers and statesmen are found at various points throughout the city, in

a majority of cases in parking spaces named in honor of the men whose statues adorn them.

Commerce.—Washington's commercial interests are small. Manufacture is carried on in the city in a very limited degree, although a large sum of money is invested in plants and material and the value of the output is considerable. To a great extent the goods turned out are for home consumption only. The census report for 1900 shows that there are 2,754 manufacturing establishments with a total capital of \$41,981,205. In these establishments are employed 24,628 persons who are paid in wages \$14,643,714 annually. The raw materials used were valued at \$19,369,571 and the product was \$47,667,622. Fully 20 per cent of the manufacturing and mechanical industry of the District is the product of the government. The financial interests are much more important. Reports made to the comptroller of the treasury in April 1903 by the banks and trust companies of the District show that since 1894, although there is one less bank and one more trust company, the capital of the banks of Washington has more than doubled. The amount of money available in the local banks of Washington is given as \$53,041,445. In 1895, with 13 banks and three trust companies the capital was but a little over \$23,000,000. The real estate interests of the city are enormous. Investors from out of town control large blocks of property and there has, in times past, been much speculation. Over 50 per cent of the property is controlled by the United States government and its holdings are being increased from time to time as the demand for sites for public buildings increases. To the active speculation in real estate Washington owes the development of its handsome suburbs, both in the District and in the States immediately surrounding it. Aside from the manufacturing interests a vast business is carried on in its mercantile establishments. Washington has several modern department stores of the most advanced type. The business section of the city, from Sixth to Fifteenth streets, east and west, and from Pennsylvania Avenue to K Street, north and south, teems with life at all hours of the day. Most of the business is carried on in the northwestern quarter of the city, although there are small establishments in great number in every section.

Transportation.—The street railroads have played no unimportant part in the development of the District. All of the street railroads within the heart of the city are operated on the underground electric system. This general adoption of the underground system is the result of legislation by Congress prohibiting the stringing of wires and the use of the overhead trolley within the city limits. There are but two railroad companies doing business in the District properly speaking. The largest of these, The Washington Railway & Electric Company, is a syndicate controlling the operation of eight of the smaller companies. It operates eight lines in the city and six lines in the suburbs. The other company, the Capital Traction Company, controls three lines operating on Pennsylvania Avenue, Seventh Street and Fourteenth Street respectively, with their branches and connections. The total street railway mileage in the District is 146.29 miles; 75.80 miles of which is double track underground electric; 9.93 miles is single track underground electric;

WASHINGTON

1. Congressional Library

2. State, War and Navy Building.

WASHINGTON

57.60 miles is double track overhead trolley; 2.96 miles is single track overhead trolley; all the overhead trolley lines are operated in the suburbs, and in several instances connect with related lines in Maryland and Virginia.

Public Buildings.—Because of the stringent building laws in the District the skyline of Washington will never be disfigured by tall office buildings. The law requires that no building shall exceed in height the width of the street on which it fronts. The public buildings are many and of fine architecture, as are also hundreds of the private residences. The largest and most important building is the Capitol, situated on a high plateau 88 feet above the level of the river. The central portion of the building was begun in 1793; in September of which year the corner stone was laid by President Washington. This part of the structure is built of sandstone quarried on Aquia Creek, Va., a few miles below Washington, and cost up to 1827, \$2,433,844.13, which included the expenditures made necessary by repairs after its destruction by the British on 24 Aug. 1814. The corner stone of the extensions or wings was laid 4 July 1851 by President Fillmore, Daniel Webster officiating as orator. These extensions were completed in 1859. The building is 751 feet 4 inches in breadth and 350 feet in depth. The area covered by the building is 153,112 square feet with a height from a base line at the east front of 287 feet 5 inches. The total cost of the Capitol building was about \$14,000,000. Next to the Capitol itself the Library of Congress is the most important structure in Washington. This was completed in 1897 and cost the government \$6,347,000. It contains the great national library and 45 miles of shelving, sufficient to hold 2,200,000 octavo volumes. In addition to the 1,415,475 books, papers, pamphlets and prints that are kept within its doors, the library has 178,140 other articles deposited for copyright purposes. The business of the library furnishes employment for 417 people and the last annual appropriation for its maintenance was \$768,845. The treasury department, at the corner of Fifteenth Street and Pennsylvania Avenue, the oldest of the departmental buildings, is constructed of freestone and granite in the Ionic style and cost \$7,000,000. On Pennsylvania Avenue between Eleventh and Twelfth streets is the new city post-office and post-office department. This building, constructed entirely of granite, occupies an entire block. It is one of the handsomest structures of the modern style of architecture. The State, War and Navy departments occupy a large granite structure built on the Renaissance style of architecture at the corner of Pennsylvania Avenue and Seventeenth Street. This building occupies more than four and a half acres and cost \$11,000,000. It is said to be the handsomest structure in Washington, excepting the Capitol and Library buildings. The building popularly known as the Patent Office, but which is really the secretary's office of the Interior Department, is a large structure of white marble of a pure Doric style. It cost \$3,000,000, and occupies the two blocks between Seventh and Ninth and F and G streets northwest. Opposite this building, fronting on F Street, is the old building of the post-office department, a structure built of marble in the Corinthian order of architecture, covering one block. This building is occupied

by the general land office and Indian bureau. The pension bureau is housed in an imposing brick structure in Judiciary Square, near the corner of Fifth and F streets northwest. Here have been held many of the great functions known as inaugural balls. The old city-hall building, now occupied by the District Supreme Court and Court of Appeals, is one of the old city buildings. It is situated in Judiciary Square fronting on D Street and Louisiana and Indiana avenues, at the head of Four and a Half Street or John Marshall Place. The home of the President, fronting on Pennsylvania Avenue, between the Treasury Department and the State, War and Navy building, is an artistically plain building of freestone painted white, from which it derives the name of White House. This was one of the buildings partially destroyed by fire in 1814 at the time the British burned the city. The offices of the President are contained in a low white building, built of brick, at the western extremity of a long colonnade extending from the White House. Directly south of the White House is the Washington Monument, a marble shaft 555 feet in height, to the building of which almost every country on the face of the earth contributed a stone. An elevator is run to the top of the building from which a fine view of Washington can be obtained. The Washington Public Library, the gift of Andrew Carnegie, occupies a parking space known as Mount Vernon Square, at the intersection of Seventh, Eighth, Ninth, and K streets and Massachusetts and New York avenues. This beautiful building was opened in 1902. On the south side of the Mall near Ninth Street is the Smithsonian Institution, a building of brownstone in the ancient Gothic style of architecture. It is one of the handsomest structures in the city and was built with money bequeathed by James Smithson, an Englishman. Adjoining it on the east is the National Museum, soon (1904) to have a new building which will cost in the neighborhood of \$4,000,000. Near the Museum are the Army Medical Museum and the Fish Commission buildings. To the west of the Smithsonian Institution is the building of the Department of Agriculture. Congress, in 1903, appropriated money for a new building for this department. Near the Department of Agriculture is the Bureau of Engraving and Printing, where all the paper money, stamps and bonds are made. The government printing office, the largest and most complete printing establishment in the world, is housed in a huge brick structure on the block bounded by North Capitol and First and G and H streets northwest. The large public buildings also include the naval observatory, the naval museum of hygiene and the coast survey buildings. New buildings are about to be constructed for the department of justice, for the Supreme Court of the United States, for the bureau of standards, and for the safe-keeping of government records. There is also in the process of construction a union station building which is to be one of the finest and most commodious of railroad terminals. It will cost about \$5,000,000 when finished and the approaches to it will cost about \$11,000,000. Part of the expense of changing grades, etc., is to be borne by the United States and District governments. There are many large buildings owned by private individuals or corporations which add to the architectural

WASHINGTON

beauty of the national capital. Among these are the *Evening Star* building, the Southern Railway building, the Lafayette Square Theatre, the New Willard Hotel, the Shoreham Hotel, the Cosmos Club, the Georgetown University, the Catholic University, the McKinley Manual Training School and the buildings of the Soldiers' Home.

Military.—Washington as the headquarters of the army and navy has three public reservations devoted exclusively to these branches of the public service. The most important of these is the navy yard, containing gun shops in which all the large guns for the vessels of the navy are made. Here also is a huge tank in which models of naval vessels are tested for speed, displacement, etc. Connected with the navy yard is a museum of arms and ordnance. Near the navy yard is situated the marine barracks, covering an area of two city blocks. The largest military reservation in or near the District is Fort Myer, originally established on the heights above Washington on the Virginia shore of the Potomac, as a post for the signal corps and named in honor of Gen. Myer, the officer who established the signal corps as a part of the army but who is better known for having established the weather bureau. At Fort Myer barracks and quarters are maintained for four troops of cavalry and two batteries of field artillery of the regular army. The reservation at Fort Myer adjoins the Arlington National Cemetery and includes a portion of the old Custis estate. In Washington is situated the Washington Barracks, now the seat of the Army War College and the School of Application for the engineer corps of the army. This is the oldest military post in this section of the country, having been established prior to the war of 1812 as an ordnance storage post. On this reservation the statue of Frederick the Great, the gift of the Emperor of Germany, is to be erected in October 1904. Here also is the site of the old military prison where the conspirators who were charged with complicity in the assassination of President Lincoln were tried, sentenced and those given the death penalty were executed. Near Washington are Forts Washington, Hunt and Foote, all of which are on the Potomac River below the city. The organized militia of the District of Columbia numbers about 1,700 men grouped into one brigade of two regiments and one separate battalion, including 28 companies of infantry; one battery of field artillery, one engineer corps, one signal corps, one ambulance corps and one naval battalion. The brigade is commanded by a brigadier-general who with his staff and all the line officers, are appointed by the President. The adjutant-general of the District militia is an officer of the regular army detailed by the War Department.

Churches.—Washington has some of the finest church buildings in the country; 17 sects are represented with 163 places of worship. The Episcopalians head the list with 31 churches; the Methodists have 27; Presbyterian, 22; Catholic, 17; Baptist, 16; Lutheran, 15; Methodist Episcopal South, 6; Methodist Protestant, 6; Congregational, 4; Christian (Campbellite), 4; Friends, 4; Reformed, 2; Hebrew, 2; Swedenborgian, Unitarian, United Brethren and Universalist, 1 each. In addition to these there are three organized societies of Christian Scientists; two Spiritualistic societies, one Pro-

gressive Brethren and two non-sectarian, the People's and the United States Christian. The aggregate membership in all these organizations is considerably over 60,000. The amount of property held by religious orders or organizations which is exempt from taxation and is used for religious purposes has an assessed valuation of \$6,405,702, this, in addition to the property held by such organizations for educational or charitable purposes, which is also exempt from taxation. The best known churches in Washington are the New York Avenue Presbyterian Church (Lincoln's Church), the Metropolitan Methodist Episcopal Church, attended by Presidents McKinley and Grant; the Church of the Covenant (President Harrison's church), the First Presbyterian Church (President Cleveland's church), and Saint John's Episcopal Church, the most fashionable church in Washington. To this list might also be added Grace Dutch Reformed Church, which President Roosevelt attends (1904).

Cemeteries.—There are nine large cemeteries in or near the District. The largest is the Arlington National Cemetery, the old Custis estate on the Virginia side of the Potomac River overlooking the city. This is the magnificent estate owned by Gen. Robert E. Lee which was seized by the general government. The old mansion yet remains preserved in excellent condition. On the broad hillside sloping from the mansion to the river lie buried many of the soldier dead of the country, with Sheridan, Crook, Lawton, and Admiral Porter among the most prominent men whose last resting place this is. Here also can be found the graves of the men who perished in the Maine and many of those who died from wounds and disease in Cuba and the Philippines, together with the graves of thousands of Union and Confederate dead of the Civil War. At Soldiers' Home the inmates of the home are buried and many a veteran finds his last resting place here. Another national cemetery is that at the extreme end of Seventh Street road known as the Battle Ground Cemetery. Washington has but one crematory for the dead. In addition to the cemeteries included in the figures given above there are several devoted exclusively to negroes and one or two for the Hebrew dead.

Society.—The national capital is rapidly becoming the social and educational centre of the United States. Persons of great wealth from all sections of the country are flocking to the city during the sessions of Congress, many such persons having built large residences here. The city, as the focal point of governmental activity, attracts large numbers of people of all classes, making the social season one of great interest and activity. The clubs and theatres are among the best in the country. The most important clubs are the Army and Navy, Cosmos, Metropolitan, University, Alibi, Chevy Chase, and Country. The two last named are country clubs having handsome club houses in the suburbs. In addition to these there are a number of smaller clubs and club houses. There are seven theatres in the city.

Newspapers.—Almost every daily newspaper of consequence in the United States has an office in Washington, some of the largest papers supporting resident staffs with regular organization throughout the year, while others maintain correspondents during the sessions of Congress.

Photographed by Frances Benjamin Johnston

THE WASHINGTON MONUMENT.

WASHINGTON

There are three large daily newspapers in Washington, the *Evening Star*, an afternoon paper owned by the Evening Star Newspaper Company, of which S. H. Kauffman is president and Crosby S. Noyes editor; the *Washington Post*, owned by the Washington Post Company, of which Beriah Wilkins is the president and editor, and the *Washington Times*, owned by Frank A. Munsey. There are several weekly and monthly publications which enjoy a large circulation. See also DISTRICT OF COLUMBIA.

GEORGE H. HARRIES,
Vice-Pres. Washington Railway & Electric Co.

Washington (D. C.), Early's Attempt on. On 13 June 1864 Gen. Early marched from Gaines' Mills, under orders from Gen. Lee, to attack and drive Gen. Hunter from the Shenandoah Valley and then cross into Maryland near Leesburg, or at or above Harper's Ferry, and threaten Washington, thus hoping to draw troops from Grant's army. Hunter's failure at Lynchburg (q.v.) and his retreat toward the Kanawha left the Shenandoah Valley open to the movement into Maryland, and 27 June Early concentrated his army at Staunton, moving next day down the valley and reaching Winchester 2 July. He broke the railroad west of Martinsburg, drove Gen. Sigel from that place 3 July and across the Potomac to Maryland Heights (q.v.), crossed the Potomac at Shepherdstown Ford, demonstrated on Sigel, then crossed South Mountain by Turner's, Fox's, and Crampton's Gaps and attacked and defeated Gen. Lew Wallace on the Monocacy (q.v.), 9 July, Wallace retiring on the Baltimore road, leaving open to Early the road to Washington. Early had under his command the four infantry divisions of Rodes, Ramseur, Gordon and Echols, Ransom's division of cavalry, and Long's three battalions of artillery, in all about 15,000 men and 50 guns. On the morning of 10 July Early marched on the direct road to Washington and bivouacked at night four miles north of Rockville. McCausland's cavalry brigade, which had preceded him, drove from and beyond Rockville, about 600 Union cavalry, under command of Maj. Fry, of the 16th Pennsylvania cavalry. During these movements, from the time of entering Maryland, the Confederate cavalry was industriously engaged in gathering up horses, sheep, hogs, and cattle of all kinds, grain, bacon, and subsistence of every kind, and shoes and clothing. The live stock was driven across the Potomac. Bradley T. Johnson's cavalry brigade, moving from Frederick toward Baltimore, occupied several towns on the way and destroyed the Northern Central Railroad at Cockeysville. Another cavalry detachment stopped a train of cars at Magnolia Station, on the Baltimore & Ohio Railroad, and burned the train and Gunpowder River bridge. Wires were cut and communication with the north severed. At dawn, 11 July, Early marched through Rockville, McCausland, who had the advance, took the Georgetown road and by 9 o'clock was stopped by Col. Lowell, with a small cavalry force, in advance of Fort Reno. He formed Early's right. The main force, preceded by Imboden's cavalry brigade, marched for the Seventh Street road, running past Silver Spring, while Jackson's cavalry brigade moved on the left flank. Imboden's cavalry drove a small body of Union cavalry into the works on

the Seventh Street road and, dismounting, deployed as skirmishers. Early rode ahead of his infantry and arriving in front of Fort Stevens at noon, discovered that the works were but feebly manned. The northern defenses of Washington consisted of a series of detached works, at intervals of 800 to 1,000 yards, generally connected by rifle-pits, and mounting 400 heavy guns with a large range of fire. The one in Early's front, west of Seventh Street road, was Fort Stevens, with Fort De Russy on its left, from which it was separated by a deep ravine, through which ran Rock Creek; the one on the right was Fort Slocum. Fort Stevens had been furnished with a powerful armament, mostly of siege guns, well protected by embrasures and traverses. It had an extensive bomb-proof; and a hollow in the rear was capable of sheltering large bodies of men from artillery fire. Gen. Augur, commanding the defenses, had collected some heavy artillerymen, and a miscellaneous force of militia, convalescents, invalid corps, marines and sailors, department clerks and other employees of the government, and placed them under command of Gen. A. McD. McCook. The whole force, prior to the arrival of the Sixth corps, numbered about 8,000 men. The line immediately north of the city was garrisoned chiefly by the 150th and 151st Ohio regiments of 100 days' men, two or three companies in each fort, and by detachments of volunteer artillery of Gen. M. D. Hardin's division of the Twenty-second corps, whose two brigades held the entire line of sixteen forts from the Potomac, above Chain Bridge, to the Eastern branch. The cavalry, under command of Col. Lowell, consisted of detachments of the 2d Massachusetts, 8th Illinois, and 16th Pennsylvania, in all about 1,000 men, and was in advance of the works from the Potomac to Fort Stevens. When Early, who was within sight of the dome of the capitol, had seen the works, thought to be feebly manned, he ordered Rodes' division into line, in front of Fort Stevens, and, about 1.30 p.m. when the skirmishers were within range, the Union artillery in Fort Stevens, under Capt. Dupont, opened a rapid fire, clouds of dust appeared rising behind the fort, and soon a Union column was seen—a body of quartermasters' employees and 600 dismounted cavalry, under Maj. G. G. Briggs of the 7th Michigan, filing into the works on the right and left of the fort, whose skirmishers advanced to the front, before whom those of Rodes fell back, after approaching within musketry range of Fort Stevens and wounding men on its parapet. This dashed Early's hope of getting possession of the works by surprise and he consumed the rest of the day in reconnoitering. Meanwhile a substantial and timely reinforcement had arrived to strengthen the Union defense. Gen. Grant had doubted whether Early had anything more than cavalry in Maryland, but had sent Ricketts' division to Baltimore, and, on the night of the 9th, a few hours after Wallace's defeat on the Monocacy, ordered Gen. Wright, commanding the Sixth corps, to march his other two divisions from the lines before Petersburg to City Point, 14 miles, where he arrived at daylight of the 10th, took transports and by 2 p.m. of the 11th arrived at Washington, where, just arrived, was a steamer with 800 men of the Nineteenth corps, who, having reached Hampton Roads from New Orleans, had been sent directly

WASHINGTON

to Washington. President Lincoln was on the wharf to greet the troops on their arrival. Wright quickly landed his troops and marched them to near Fort Stevens, where he bivouacked, sending 900 men to relieve those that had been thrown out in front of Fort Stevens: being old soldiers, they immediately intrenched. Late in the evening 1,500 quartermasters' employees, and 2,800 convalescents, under Col. Frank Price, from nearly every regiment in the Army of the Potomac, took position in rear of Fort Slocum, and in the rifle-pits on either side of it.

After nightfall Early called a council of his division commanders, and a conclusion was arrived at to assault the Union lines at daybreak next morning, the 12th, but, during the night a dispatch was received from Bradley T. Johnson, near Baltimore, that two corps had arrived from Grant's army, and this caused Early to delay the attack until he could again examine the works. As soon as it was light enough to see he rode to the front and saw that the works were lined with troops, and gave up the idea of capturing Washington, but decided to remain in front of the works during the day and retire at night.

At dawn of the 12th Early was seen in position, with part of his command, at the Rives House, on the right of Silver Spring road, on rising ground, surrounded by shade trees, with an orchard near, giving cover to sharpshooters, who commanded the Union skirmish line from this point and also from McLay's House on the left of the road. Wheaton's brigade of the Sixth corps was thrown out on the skirmish line in front of Fort Stevens and instantly the Confederate sharpshooters began their work. Skirmishing continued until the middle of the afternoon, when Wright pushed out Bidwell's brigade of the Sixth corps, formed in two lines with orders to join Wheaton in an attack upon the Confederates at the Rives House. The guns of Fort Stevens and Fort Slocum opened a rapid fire and at a signal from Wright, who stood on the parapet of Fort Stevens, President Lincoln at his side, Bidwell moved forward, and with Wheaton's brigade, which formed an advance line, drove the Confederates from the Rives House and, after a sharp fight from rising ground beyond, and back for a mile upon Roden's main line, where farther advance was staved, but the skirmishing was kept up until late in the night, and the ground gained intrenched. The engagement was witnessed by cabinet officers, other officials and some ladies from behind the parapet of Fort Stevens, where also the President was ordered by Gen. Wright, when the engagement opened and men were being wounded on the parapet. The Union loss was over 200, of whom 150 were of Bidwell's brigade, including two regimental commanders of the brigade killed and others wounded.

On the left, near Fort Reno, Lovell's 900 cavalry had heavy skirmishing with McCausland's cavalry brigade, and drove it back on the Georgetown road until infantry came to McCausland's support. That night Early fell back through Rockville, marched all night and halted near Darnestown. Lovell's cavalry pushed after Early on the morning of the 13th as far as Rockville, where it was attacked and driven back by McCausland, with a loss of 30 killed and wounded, after taking 38 prisoners. At noon Wright marched after Early with two divi-

sions of the Sixth corps, followed by Emory's division of the Nineteenth corps. Early resumed his march from Darnestown and crossed the Potomac at White's Ford, near Leesburg, on the morning of the 14th, heavily laden with the spoils of war. The Union loss during the three days was between 350 and 450. Early left 30 dead and 70 wounded on the field and lost over 200 prisoners, not including his wounded. The loss on both sides was comparatively small, but the event is memorable in that it was the only occasion in the history of the country, where hostile armies met so near the seat of government, and men fell in battle within the boundaries of the District of Columbia. Consult: 'Official Records,' Vol. XXXVII.; Early, 'The Last Year of the War for Independence'; The Century Company, 'Battles and Leaders of the Civil War,' Vol. IV.

E. A. CARMAN.

Washington, Ga., village, county-seat of Wilkes County; on the Georgia Railroad; about 55 miles, in direct line, northwest of Augusta. It is the northern terminus of the Washington Branch Railroad (Georgia Railroad), which connects at Barnet with the main line. Mineral springs noted for their medicinal properties attract here many health-seekers. The surrounding country is devoted mainly to agriculture. The manufactures are flour and lumber products. The principal buildings are the county court-house, six churches, and the schools. It has a high school, opened in 1893, Saint Joseph's Academy (R. C.), public and parish schools, and Saint Joseph's Orphanage. There are two banks having a combined capital of \$112,000 and deposits amounting to \$241,000. Pop. (1890) 2,631; (1900) 3,300. The population of the town of Washington, which is a part of the village in industrial and commercial life, is (1900) 4,436.

Washington, Ill., city in Tazewell County; on the Chicago & Alton, the Toledo, Peoria & Western, the Atchison, Topeka & Santa Fé R.R.'s; about 11 miles east of Peoria and 65 miles north of Springfield. It is in an agricultural region. It has wagon and carriage works, a furniture factory, flour mill, and grain elevators. There are a public high school, established in 1876, a public library, and two private banks. Pop. (1890) 1,301; (1900) 1,459.

Washington, Ind., city, county-seat of Daviess County; on the Evansville & Indiana and the Baltimore & Ohio Southwestern R.R.'s; about 100 miles southwest of Indianapolis and 20 miles east of Vincennes. It is in an agricultural and coal-mining region, and in the near vicinity there are nine large coal mines. The chief manufacturing establishments are railroad shops, flour mills, foundry and machine shops. There are extensive shipments of coal, grain, live-stock, flour, and vegetables. The city has four banks which have a combined capital of \$165,000, and the two national banks have deposits amounting to \$836,860. It has a high school established in 1874, Saint Simon's Academy, public and parish schools, and a school library. Pop. (1890) 6,064; (1900) 8,551.

Washington, Iowa, city, county-seat of Washington County; on the Chicago, Burlington & Quincy and the Chicago, Rock Island & Pacific R.R.'s; about 70 miles southwest of Davenport and 50 miles northwest of Burlington. It is in an agricultural and stock-raising

WASHINGTON

region. The chief manufacturing establishments are wagon and carriage works, cob-pipe factory, pipe-organ factory, machine shops, and creameries. The principal public buildings are the county court-house, 12 churches, the schools, banks, and business blocks. It has a high school, opened in 1867, an academy, public and parish schools, and two libraries. The five banks, two national and three State, have a combined capital of \$300,000 and deposits amounting to \$1,667,730. Pop. (1890) 3,235; (1900) 4,255.

Washington, Kan., city, county-seat of Washington County; on Mill Creek, and on the Chicago, Burlington & Quincy and the Missouri Pacific R.R.'s; about 90 miles northwest of Topeka. It is in an agricultural region, in which the principal products are wheat and corn. Stock-raising is given considerable attention. The industries are connected chiefly with the farm products and the shipment of live-stock. There are a high school, a Friends' Academy, two national banks, two private banks, and a private business school. Pop. (1890) 1,613; (1900) 1,575.

Washington, La., town in Saint Landry Parish on the Bayou Courtableau, and on the Southern Pacific Railroad; about 168 miles northwest of New Orleans. It is at the head of navigation on the bayou, and has opportunities for shipping freight by water that make it a commercial centre for a large part of the parish. There are brick and tile works, a cotton twine and yarn factory, cotton mills, and a machine shop. The principal shipments are rice, cotton, sugar-cane, and corn. The State bank has a capital of \$50,000. Pop. (1890) 1,064; (1900) 1,197.

Washington, Maine, town in Knox County; about 25 miles east by south of Augusta. It was incorporated in 1811 and called Putnam; in 1823 the name was changed to Washington. The town contains several villages, in all of which there are manufacturing interests; the principal manufactures are barrels, staves, headings, undertakers' supplies, cabinet work, and lumber. There are five churches, a high school, and district schools. Pop. (1890) 1,230; (1900) 1,019.

Washington, Mo., city in Franklin County; on the Morris Canal, and on the Lacka-souri Pacific Railroad; about 55 miles west of Saint Louis. It is in a fertile agricultural region. It has manufactories of lumber, flour, shoes, cob-pipes, leather, musical instruments, agricultural implements, and furniture. There are made extensive shipments of packed beef and pork, wheat and corn, and lumber products. There are six churches, public schools, Roman Catholic and Lutheran schools. The city has two banks, having a combined capital of \$75,000 and deposits amounting to \$786,630. Pop. (1890) 2,725; (1900) 3,015.

Washington, N. J., borough in Warren County; on the Morris Canal, and on the Lackawanna Railroad, about 61 miles west of Newark, and 12 miles northeast of Easton, Pa. It is near the base of Scott Mountain, on the south side, and is in an agricultural region. The chief manufacturing establishments are piano and organ factories, silk mills, machine shops, and furniture factory. There are six churches, a high school, founded in 1882, public elemen-

tary schools, and a school library. There are two banks, having a combined capital of \$150,000 and deposits amounting to \$738,680. Pop. (1890) 2,834; (1900) 3,580.

Washington, N. C., town, county-seat of Beaufort County; on the Pamlico River, and on the Atlantic Coast Line Railway, 103 miles northeast of Wilmington, N. C. It is at the head of navigation on the river, has freight connections by water with the Atlantic coast ports and the West Indies. There are grain elevators and large warehouses; the principal exports are fish, vegetables, flour, and fruit. The town also contains barrel and sash factories, lumber and planing mills, and steam cotton gins; oyster fishing is an important industry. There are two banks, one of which is a State bank with \$50,000 capital. The town has a high school, founded in 1899, with a school library of about 1,400 volumes (in 1904). Pop. (1890) 3,545; (1900) 4,842.

Washington (N. C.), Military Operations at. This place, on the lower Pamlico River, was taken possession of by Col. Stevenson, with a detachment of the 24th Massachusetts, on 21 March 1862, the Confederates having abandoned it on the approach of the Union gunboats conveying the troops. Stevenson returned the same day to Newbern, but the place was subsequently occupied by Union troops and early in September 1862 was held by a small force of cavalry and infantry, with a battery of four guns, under Col. E. E. Potter, 1st North Carolina (Union) infantry, supported by two gunboats lying in the stream. At early dawn, 6 September, Potter, with the greater part of his command, started for Plymouth, leaving but a small force in the place, when Col. S. D. Pool, at the head of five companies of North Carolina cavalry and mounted infantry, dashed into the town, surprised the company of artillery in the barracks and captured its four guns. Hearing the firing, Potter retraced his steps, and after a sharp fight of three hours, the gunboats assisting, he drove Pool out and followed him eight miles, taking some prisoners. The Union loss was 8 killed and 26 wounded; the Confederate loss, 13 killed and 57 wounded. During the action the magazine of the gunboat Pickett exploded, 19 men being killed and 6 wounded.

After Gen. D. H. Hill's failure on Newbern (q.v.), in the middle of March 1863, he moved against Washington, appearing before it on the 30th, and driving in the Union outposts. Gen. J. G. Foster, hearing of Hill's movement, left Newbern by steamer on the 29th, arriving at Washington early next morning, and assumed command of its garrison, consisting of about 1,200 men, with a battery of artillery. Gen. Lee had advised against an assault on the place, and Hill proceeded to invest it. Batteries were thrown up commanding the river and the roads leading to the town, and at the end of two days communication was cut off, except by venture-some parties, who ran past the water batteries, carrying ammunition and provisions in small boats. At daybreak 1 April the Confederates opened fire from a battery of Whitworth guns on the south side of the river, at Rodman's Point, 98 of the shots striking the gunboat Commodore Hull. Foster threw up batteries on the north side of the river to draw the fire away

WASHINGTON — WASHINGTON AGRICULTURAL COLLEGE

from the gunboats, and ordered the troops that had followed him in transports from Newbern to be landed and attack the Confederate battery at Hill's Point in rear, while the gunboats engaged it in front, but the Union officer in immediate command of the troops, considering himself not strong enough for the purpose, made no effort. On 4 April the gunboat *Ceres* ran past the batteries with a good supply of ammunition. The siege progressed languidly until the 8th, when the Confederates opened and kept up a heavy fire at the gunboats and at Fort Hamilton, on the land side of the town, to which the fort did not reply for want of ammunition. On the 9th it was discovered that the Confederates had built four batteries to the right and in front of Fort Hamilton, and fortunately two small schooners ran the blockade during the day, with ammunition, with which it was supplied. After the failure to land troops and attack the battery at Hill's Point, transports conveyed them back to Newbern, and an expedition was organized to march from that place on Washington and take the Confederate line in rear. The expedition consisted of 15 regiments, numbering 7,000 men, and was under command of Gen. Spinola, who crossed Neuse River on the 7th and, reaching Blount's Creek, found Pettigrew's brigade so strongly intrenched that after a sharp engagement on the 9th at Blount's Mills he withdrew to Newbern. The Confederates continued their fire upon Fort Hamilton from the 10th to the 13th. Several ineffectual attempts had been made to relieve the garrison, when Col. H. T. Sisson offered to do it with his regiment, the 5th Rhode Island. The transport steamer *Escort* was protected by bales of hay on her guards and deck; the troops were put on board, and, sailing from Newbern, on the night of the 13th, ran past the batteries and up the river, with not a man injured, and landed a plentiful supply of ammunition and commissary stores, much to the chagrin of the Confederates. Next morning the 5th Rhode Island was placed on the line of works. On the morning of the 15th Foster, leaving Gen. Potter in command, returned on the *Escort* to Newbern to organize an expedition to raise the siege, but it was not necessary. Hill gave up the siege, and, on the night of the 15th fell back toward Greenville. Washington continued in Union possession until after the Confederate capture of Plymouth (q.v.), when Gen. Grant ordered the evacuation of the place, as it was of no strategic importance. It was finally abandoned 30 April 1864, and a great part of the town burned. Consult: 'Official Records, Vol. IX., XVIII., XXXIII.; The Century Company's 'Battles and Leaders of the Civil War,' Vol. IV.

E. A. CARMAN.

Washington, Ohio, county-seat of Fayette County; on Paint Creek, and on the Baltimore & Ohio, the Ohio Southern, the Cincinnati & Muskingum Valley, and the Cincinnati, Hamilton & Dayton R.R.'s; about 75 miles northeast of Cincinnati and 30 miles southeast of Springfield. It is in an agricultural region. The industrial establishments are boot and shoe factories, soap factory, woolen mills, iron works, machine shop, planing mill, and flour mill. The government census of 1900 gives the number of manufacturing as 67. The four banks have a combined capital of \$300,000 and deposits amounting to \$1,499,000. There are a public high school,

graded elementary schools, a library, and private business schools. Pop. (1890) 5,742; (1900) 5,751.

Washington, Pa., borough, county-seat of Washington County; on Chartiers Creek, and on the Pennsylvania, the Baltimore & Ohio, the Waynesburg & Washington R.R.'s; about 32 miles southwest of Pittsburg. It is in an agricultural and coal region. The chief industrial establishments are tube and pipe works, steel works, tin plate and iron works, glass factories, petroleum works, machine shops, and foundries. The government census of 1900 gives 150 manufacturing establishments, which were capitalized for \$2,897,670, and in which were employed about 2,206 persons, to whom were paid annually \$1,052,616. The amount paid annually for raw material was \$2,303,113 and the value of the finished products was \$4,667,330. In January 1904 there were about 4,000 employees in the manufacturing. The principal public buildings are the county court-house, erected in 1901, and which cost about \$1,250,000; the Washington Hospital, and the churches and schools. There are 27 churches, representing 13 different denominations. The educational institutions are Washington and Jefferson College, Washington and Jefferson Academy, Trinity Hall Military School, Washington Ladies' Seminary, Washington Business College, Practical Commercial College, 10 public schools, one Roman Catholic parish school, and the Citizens' Library. The six banks have a combined capital of \$1,650,000, and, excluding one private bank, the deposits amount to \$5,975,340 (January 1903). The government is administered by a burgess and council of 21 members.

Washington was first settled in 1768 by people from the northern part of Ireland. The place was incorporated as a borough in 1810; in 1901 the boroughs of North and South Washington consolidated with the borough of Washington. The inhabitants are nearly all American born; a few hundred are from England and Wales. Pop. (1890) 7,063; (1900) 7,670; (1904) est. over 11,000.

Washington Academy of Sciences, a society for the promotion of scientific learning, organized in 1898. It is an organization uniting a number of learned societies of the city, including the Anthropological Society, the Biological Society, the Geological Society, the National Geographic Society, the Medical Society of the District of Columbia, and the Philosophical Society. The last-mentioned, organized in 1871, is the oldest of the societies composing the academy. The academy and the majority of the separate societies publish 'Proceedings.'

Washington Agricultural College and School of Science, located at Pullman, Wash. It was founded in 1890 in pursuance of the national land grant act of 1862, endowing agricultural and mechanical colleges, and of the more recent national policy of endowing a school of applied science in the newer States; it was determined to unite the work of these two in one institution, of which, also the State agricultural experiment is a part. The national government granted to the Agricultural College 90,000 acres of land, and to the School of Science 100,000 acres of land, the proceeds of the sale of which will constitute a permanent endowment for the institution. Women are admitted on equal terms

WASHINGTON AND LEE UNIVERSITY

with men. The regular courses are divided into the following departments: (1) Department of mathematics and civil engineering; (2) Department of chemistry; (3) Department of botany and zoology; (4) Department of agriculture; (5) Department of horticulture; (6) Department of English language and literature; (7) Department of economic science and history; (8) the department of mechanical engineering, including electrical engineering; (9) Department of modern languages; (10) Department of mining engineering; (11) Department of military science and tactics. There are also supplementary courses in physics, geology, and mineralogy, Latin and education, and the following special schools: the preparatory school, the school of agriculture, offering a three years' practical course co-ordinated with the work of the preparatory school; the school of dairying, with a special course of eight weeks; the school of pharmacy, offering a two years' course and conferring the degree of graduate in pharmacy; the school of veterinary science, offering a three years' course leading to the degree of doctor of veterinary science; the school of business, with a two years' course; the school for artisans, offering a practical mechanical course of two years. There are also a short course in horticulture, instruction in music, and a summer science school for teachers, offering both courses for advanced study and courses in scientific method and nature study for the elementary grades. The degrees of A. B. and B. S. are conferred for the completion of a four years' course in the regular departments; the study of military science is required of all male students; candidates for a degree must elect one of the other 10 departments as major for the four years; in the more technical departments almost all the studies are required; in other departments a larger opportunity is given for election, especially in the junior and senior years. Students in any of the 10 departments may receive the degree of A.B.; those in any but the department of English language and literature and the department of modern languages, the degree of B.S. Graduate work is also provided. The students maintain literary societies in the college and preparatory school, and several societies and clubs for the members of special departments. The college is located just outside the city limits of Pullman, on an elevation overlooking the city; the Cedar Mountains are visible to the east, and to the northwest are Mount Kamiac and the cone-like peaks of Step-toe Butte. The campus proper contains about 40 acres; the college farm, lying to east of the campus, comprises 200 acres, all under cultivation. The buildings include the administration building, science hall, college hall, mechanical hall, Ferry hall (the dormitory for men, named for the first State governor of Washington, Stevens hall (the dormitory for women, named for the first Territorial governor), the mining building, Morrill hall (for the department of chemistry), the gymnasium and armory, the veterinary hospital, the greenhouse, and farm and dairy buildings. Plans for an infirmary were under consideration in 1904. The scientific laboratories are well equipped with modern apparatus; the library in 1904 contained 7,000 volumes, in addition to which the experiment station library is open to students. The students in 1904 numbered 724, the faculty 50.

Washington and Jefferson College, located at Washington, Pa. In 1787 an academy was founded at Washington under the leadership of three Presbyterian ministers; in 1790 the courthouse where the academy held its sessions was burned, and the academy suspended, some of its patrons in 1794 chartered a new academy at Canonsburg, and the opening of this school stimulated the reopening of the Washington Academy; the Canonsburg school was chartered as Jefferson College in 1802, and the Washington School as Washington College in 1806. Many attempts were made to unite the two institutions, but all failed until 1865, when the union was accomplished under the present name. Even then rivalry existed as to the location of the college, and a compromise was effected by having a part of the faculty and students at Canonsburg and the rest at Washington; in 1869, however, the college was definitely located at Washington. The control is vested in a self-perpetuating board of trustees of 31 members. The college offers three courses leading to degrees, the classical (with the degree of A. B.), the Latin scientific (degree of B. S.), and the French scientific (degree of B. S.). These three courses differ in the work of the first two years, and are alike in the last two, in having the same studies required and the same electives to choose from. There is also a course in civil engineering. To aid students preparing for the professions, courses are suggested preparatory to the study of theology, law, and medicine; Hebrew is included in the curriculum for the benefit of those studying for the ministry. There is also a preparatory department. There are seven scholarships endowed (1904), and a student loan fund. The college occupies 16 acres within the limits of the town; a new library building, the latest addition to its equipment, was erected in 1903-4. The property and endowment of the college, including amounts pledged at the centennial celebration of 1902, amount in 1904 to between \$900,000 and \$1,000,000. The students in 1904 numbered 350, and the faculty 28. The total number of alumni is 4,043, of which about 165 entered the ministry, 950 the law, and 460 the medical profession. Of the alumni who have obtained some distinction there have been four members of the cabinet, 11 governors of States, 10 United States senators, 70 presidents of colleges and universities, 20 State supreme court judges, and two bishops of the Protestant Episcopal Church.

Washington and Lee University, located at Lexington, Va. The beginning of the university was the foundation of Augusta Academy in Augusta County, Va., established by a body of Scotch Presbyterian settlers; this academy in 1780 was finally moved to Lexington, and in 1782 was chartered under the name of Liberty Hall Academy. This charter provided for a self-perpetuating board of trustees, thus taking the institution from the direct control of the Presbyterian Church. In 1796 the academy received a generous gift from Washington, and in 1798 the name was changed to Washington Academy. In 1802 the building was destroyed by fire, and the academy for several years suffered serious financial difficulties. When relieved from these embarrassments the curriculum was extended and the name changed in 1813 to Washington College. The college was closed

WASHINGTON COLLEGE — WASHINGTON UNIVERSITY

during the Civil War, the majority of its students joining the Confederate army. Its buildings were much damaged during the Federal occupation of Lexington, and about 30 years later it received a Congressional appropriation as remuneration for the damage. The college was reopened in 1865, with Robert E. Lee as president. He served till 1870, and during his administration the college grew rapidly in numbers and influence. A school of engineering was established, and the Lexington Law School (founded 1849) became a department of the college. In 1871, soon after the death of General Lee, the name of Washington and Lee University was adopted. The university organization includes three schools: (1) the School of Arts; (2) the School of Engineering; (3) the School of Law. In the School of Arts for the degree of A. B., the courses are arranged in three groups,—the language group, the English and history group, and the mathematics and science group. The work is entirely elective, with the restriction that a certain minimum of hours must be elected from each group. The degrees of A. M. and Ph. D. are conferred for graduate work. The School of Engineering offers three courses, in civil and mining engineering and chemistry; the degree of B. S. is conferred. The degree of LL. B. is conferred by the School of Law for a two years' course. Physical training is systematic and thorough, and a certain amount of regular gymnasium work may be credited toward the A. B. degree. There are 16 general scholarships in addition to high school scholarships for accredited schools, alumni association scholarships, and one law scholarship. The university is situated on gently sloping ground, the upper part of which extends toward the campus of the Virginia Military Institute (q.v.), with which it is connected by a short avenue. The buildings include the main building; the Lee chapel, in the crypt of which General Lee is buried; Newcomb hall (the library); Tucker hall (the law building); the chemical laboratory, the gymnasium; engineering hall, and two dormitories, one of which was completed in 1904. The library contained in 1904 about 44,000 volumes, including the law library. The students numbered 308 and the faculty 34.

GEORGE H. DENNY, LL.D.,

President of Washington and Lee University.

Washington College, located at Chestertown, Md. It was chartered as a college in 1782, being the oldest institution of collegiate grade in the State. It was the direct successor of an academy with which the Free School of Chestertown (founded in 1723) had been merged, and was established as a part of the proposed University of Maryland. General Washington gave his consent to the naming of the institution for him, and became one of the board of visitors. The college is non-sectarian, and receives an appropriation from the State. It is open to women. The college offers two collegiate courses, classical and scientific, each leading to the degree of A. B., a normal course, and a preparatory course of three years. There are no electives in the collegiate courses. The normal course extends over three years, the first year's work being the same as the last year of the preparatory course; the study of Latin after the first year is optional. Gymnasium work is a regular part of all courses. There are

a number of scholarships established by the State for both collegiate and normal courses. The buildings include the main building, normal hall (a dormitory for women, built by the State), and the gymnasium. The library in 1904 contained 5,000 volumes, the students numbered 119, and the faculty 10.

Washington College, located in Washington County, Tenn. It was chartered as an academy in 1783, and as a college in 1795, and was the first institution of higher learning west of the Alleghany Mountains. During the Civil War, and for a short time after the war, the resources of the college were seriously crippled, and only a course of academic grade was offered. Two thirds of the board of trustees must be Presbyterians, but the college is not otherwise under denominational control. Two college courses are offered, the classical leading to the degree of A.B., and the scientific leading to the degree of B.S. There are also courses in music and oratory, a preparatory department with an auxiliary department giving instruction in domestic science, and an industrial department (established in 1892-3) affording opportunity for students to pay a portion of their expenses by manual labor. The campus, consisting of 16 acres, occupies an elevated site, commanding a view of the surrounding mountains; the buildings are the recitation hall, the boys' dormitory, and the girls' dormitory. Salem Church is used as the college chapel. The students in 1904 numbered 120, of whom 100 were in the collegiate and preparatory courses.

Washington, Fort. See FORT WASHINGTON.

Washington, Mount, in New Hampshire, the highest peak of the White Mountains, and the highest point in the northeastern part of the United States. Its altitude is 6,293 feet; it is east of Crawford Notch. Granite is the chief rock formation of the whole mass. On the east side there are many deep gorges, and several on the north; on the west the slope is steep. The summit is rocky, with scanty vegetation compared with the lower slopes and base, where large trees are numerous. For many years a carriage road has extended to the top, and since 1869 a rack-and-pinion road has enabled tourists to ascend to the summit with ease. A United States meteorological station and a large hotel are on the summit.

Washington, Treaty of, a treaty between Great Britain and the United States, signed 8 May 1871. Under its terms the Alabama claims, the San Juan boundaries, and certain fisheries disputes were settled by arbitration. See TREATIES.

Washington University, located at Saint Louis, Mo. It was founded in 1853, and is a non-sectarian institution, being under the control of a self-perpetuating board of trustees of 17 members. Besides the Collegiate Department, there are engineering, law, art, and medical departments. The college confers the degree of A.B., the course is largely elective, the work of the junior and senior years entirely so; the Engineering Department offers courses in civil, mechanical, electrical, and chemical engineering, and architecture, and confers the degree of B.S. For graduate work the university confers the degrees of A.M., M.S., Ph.D., and the professional degrees of civil, mechanical,

WASHINGTON, UNIVERSITY OF — WASPS

electrical, and chemical engineer after not less than three years of successful active practice. The productive funds of the university in 1903 amounted to \$4,767,000; the library contained 28,000 volumes; the students numbered 2,219, and the faculty 196. See also SAINT LOUIS — Education.

Washington, University of, the State university located at Seattle, Wash. The first steps toward the establishing of the university were taken by the first territorial legislature in 1854, which petitioned Congress for a grant of land; an appropriation of two townships was shortly afterward made by Congress. In 1855 the legislature organized the Territorial University of Washington in two equal institutions, one located at Seattle, the other on Boisfort Plains, Lewis County; but as no further steps were taken toward the establishing of the university, the legislature united the two institutions and fixed the location in Cowlitz Farm Prairie, Lewis County. This shifting policy led the people of the Puget Sound region to incorporate another university, and the fear of thus duplicating institutions led the legislature to definitely fix the location of the University of Washington at Seattle, and to appoint a board of commissioners to select and sell the granted lands and establish the university. The main building was completed in 1862, and the university opened to students in the same year. In its earlier years the university met with many difficulties, chiefly financial, as the Territory appropriated no money for its maintenance until 1879; its progress was slow until 1893, when the legislature provided a new site and appropriation for building purposes. Since that time the growth of the university has been both continuous and rapid, and it has taken its place as the real head of the educational system of the State. It is open to all without charge for tuition, except in the School of Law. The board of regents consists of seven members appointed by the governor with the approval of the Senate, for a term of six years. The university includes the following schools: (1) The College of Liberal Arts; (2) the College of Engineering; (3) the School of Mines; (4) the School of Pharmacy; (5) the School of Law. A School of Medicine is also to be organized. The College of Liberal Arts offers a classical, a literary, and a scientific course, all leading to the degree of A.B. In each course half the work is elective; the electives include a major study, selected at the beginning of the junior year. Most of the elective work falls in the last two years, but there is some in the sophomore year, and in the freshman year of the literary and scientific courses. A limited amount of gymnasium work is required for the degree. Courses in pedagogy are included in the curriculum. The degree of A.M. is conferred for graduate work. The College of Engineering offers three courses, civil, electrical, and mechanical engineering, leading to the degree of B.S. The degrees of C.E., E.E., and M.E. are conferred for graduate work. The School of Mines offers two courses leading to the degree of B.S., mining engineering, and geology and mining, and a short course in mining for prospectors. Graduate work is offered which leads to the degree of E.M. (engineer of mines). The School of Pharmacy has a two

years' course leading to the degree of graduate in pharmacy, and an advanced four years' course with the degree of pharmaceutical chemist. The School of Law provides a two years' course which leads to the degree of LL.B., and admits to the State bar without further examination. The students maintain a general association which has charge of student government, debating clubs, a dramatic club, and several special associations for members of certain departments of study. Four Greek letter fraternities, and two sororities have chapters at the university. The university grounds comprise 355 acres lying between Lakes Union and Washington; the plan for the arrangement of the buildings is a modification of the quadrangle, all buildings being grouped around an ellipse, whose major axis is 1,200 feet and the minor axis 650 feet. All buildings are to be constructed of materials found in the State. The buildings erected in 1904 are the Administration Building, Science Hall, the observatory, the assay shop, two dormitories, one for men and one for women, and the gymnasium, containing separate exercise rooms, dressing rooms, and equipment, for men and women. The scientific laboratories are well equipped with modern apparatus; the library in 1903 contained 14,480 volumes; in addition to which the university owns the library of the School of Law, 1,000 volumes, and a special library of American history, 350 volumes. The students numbered 631, of whom 363 were in the College of Liberal Arts; and the faculty 40.

Washita, wōsh'ī-tā, or **Ouachita**, a river which rises in Polk County, Ark., and flows east then south into Louisiana, entering the Red River in the east central part of the State. The chief tributaries are Saline, La Fourche, Tensas, and Little Missouri. The part of the river below the point where the Tensas enters is often called the Black River. The Washita is navigable throughout the year as far as Camden, Ark., and for about eight months to Arkadelphia, Ark. The total length is about 600 miles. In the Indian Territory is a river called Washita, or False Washita, which also enters the Red River above Preston, Texas.

Wash'o Indians, a linguistic stock of North American Indians, consisting of the Washo tribe, whose original range extended from Reno, on the line of the Central Pacific Railroad in western Nevada, to the lower end of Carson Valley. The vicinity of Carson is now the chief seat of the tribe and here and in the neighboring valleys there are about 200 living a parasitic life about the ranches and towns.

Wasps, hymenopterous insects, typically belonging to the family *Vespidae*, in which the head-shield is square and the mandibles or greater jaws short and toothed at their tips. The wings are folded once longitudinally when at rest. The antennæ of the males are 13-jointed, those of the females and neuters or workers 12-jointed. The abdomen is egg-shaped and often borne on the thorax by a slender stalk.

The true wasps differ considerably in appearance and greatly in habits. Some of them live in pairs and construct simple cells of mud which are attached to twigs, beneath stones, etc., and stored with paralyzed spiders and insects upon which the larvæ feed; others burrow

into the stems of plants or the ground and provide for the young in a similar manner. All such are known as solitary wasps, to distinguish them from the social or colonial wasps, and are sometimes separated as a distinct family (*Eumenidae*). The true social wasps are all paper-makers and their nests are sometimes of large size and shelter a great many individuals. Unlike the solitary wasps which are of perfect males and females only, the social wasps produce in addition a caste of "workers" or infertile females.

Eumenes fraterna is a well known solitary wasp, easily recognizable by the long and slender pedicle formed by the basal segment of the abdomen, the short square thorax, and long jaws. Its nests are dainty spheres about half an inch in diameter constructed of mud pellets and attached, often several in a row, to twigs or walls, and sealed after being provided with a fertilized egg and a supply of caterpillars. *Odynerus* and several related genera having very similar habits have the abdomen sessile. They are often gaily colored and some of them place their mud cells within hollow galls or the deserted nests of other insects. *Raphiglossa* forms burrows in the pithy stems of briars and stores its cells with the larvæ of weevils. Of the social paper-wasps the species of *Polistes* somewhat resemble *Eumenes* in the slender more or less petiolate abdomen. All of the numerous species build a single tier of cells supported by a central pedicle and unenclosed in a covering. Several of the species are very common and well known. In *Vespa* the abdomen is broad, robust, and sessile, and most of the species, which include the hornets and yellow jackets, are brightly striped with yellow on a black or brown-ground color. The members of this genus exhibit the largest and most highly developed wasp communities. A common large species is *Vespa maculata*, which builds the large oval grayish paper-nests so well known. Externally they consist of several loose covering layers pierced by an aperture at the lower end. The interior is occupied by horizontal tiers of combs, like floors in a house, supported by columns, and with passages between. Each cell is hexagonal, as in the combs of bees, but the material is paper. These tiers of cells are built in succession, the upper ones first. Sexually wasps are of three kinds, males, females, and neuters, the two latter armed with an exceedingly venomous sting. The last are the workers in the hive; they also go out to bring in provisions for the community. Wasps are nearly omnivorous, feeding on honey, jam, fruit, butcher's meat, and any insects which they can overpower. A share of these viands is given to the males and females, whose work lies in the vespiary and in providing for the future progeny of the colony. The cells of a large nest may amount to more than 15,000. In these the females, which are few in number, deposit eggs, hatched in eight days into larvæ. These go into the chrysalis state in 12 or 14 days more, and in 10 more are perfect insects. The males do no work. Most of the workers, all the males, and the old females, die at the approach of winter, and in the spring each surviving female, having been impregnated in autumn, looks out for a suitable place to form a new vespiary, and builds a few cells in which are deposited eggs destined to produce workers. The latter then assume the

duties of nest-building, and the number of cells is rapidly increased to provide places for the eggs which the female continues to lay throughout the summer. *V. arenaria* is a smaller species of a richer yellow color and similar habits. The yellow jacket (*V. vulgaris*) builds similar nests in an underground chamber reached by a tunnel, and the large European hornet (*V. crabro*), naturalized in portions of the United States, nests in hollow trees.

The mud-dauber wasps belong to a distinct family (*Sphecidae*). These have the greater part of the abdomen in the form of a bulb borne on a very long and narrow stalk and the head is supported on a distinct neck. The black and yellow species of *Pelopaeus* make the familiar rough mud-cells which are so commonly plastered to the ceilings of barns, outhouses, and garrets, and which are packed with spiders at once paralyzed and preserved by a thrust of the sting through the nerve ganglia. Many of the numerous other genera of this family burrow into banks or along paths, but all have the habit of provisioning the nest with spiders or caterpillars. Some of them are very large and handsome wasps. A related family of burrowing or "sand" wasps is the *Pompilidae*, which have long, non-angulated antennæ and rather small eyes. A very fine large species (*Pepsisformosus*), found in the Southern States, is known as the tarantula-killer from its habit of attacking that huge spider, with which its cells are stored. Not infrequently a very large wasp, with a stout, heavy body about 1½ inches long, is seen half flying, half walking, burdened by a cicada which it has captured and is bearing off to its burrow. This is *Sphecius speciosus*, a representative of the family *Bembecidae*, which, like the last two, has the wings unfolded when at rest. Still another interesting family of fossorial wasps is the *Mutillidae*, or wingless wasps. Most of them are richly colored and hairy; and are seen running in sandy pathways. They are commonly mistaken for ants, but sting severely. There are numerous other wasps which cannot be even mentioned. Suffice it to state that the North American fauna includes about 1,500 known species, arranged in 17 families.

Wasson, wō's'ōn, David Atwood, American clergyman and author: b. Brooksville, Me., 14 May 1832; d. West Medford, Mass., 21 Jan. 1887. He entered Bowdoin College in 1845, but remained only one year; went to sea in search of health; studied law and for a short time practised; and in 1848 entered the Bangor Theological Seminary. In 1851 he became minister of a Congregational church at Groveland, Mass., took charge there of an independent society with which he remained until 1857, with an interval of six months at Worcester, Mass. In 1865 he was called to the Twenty-eighth Congregational Society (Theodore Parker's), Boston, but soon retired on account of illness. Afterward he resided for several years

WASTE

in Germany, and finally settled at West Medford. A profound thinker and writer, of striking originality, and with a style equally powerful and brilliant, Wasson contributed in prose and verse to various periodicals—the 'North American Review,' 'Atlantic Monthly,' 'Christian Examiner,' 'Radical,' etc.—his subjects including political philosophy and government, economics and religion, ethics and social reform. The principal collection of his verse is the volume of 'Poems' (1888), edited by Ednah D. Cheney, including 'All's Well,' a classic of faith; 'Babes of God,' a pæan of Wasson's optimistic philosophy; 'Seen and Unseen'; 'Ideals'; 'Orpheus'; 'Scipio to the Senate'; and others, equally striking in thought and expression.

Waste, or By-products. Waste is such material as is rendered either wholly or partially useless in the manufacture of products and articles of all kinds, but the name is sometimes retained long after a substance, at one time of little or no value, has been utilized. When iron ore is smelted, or coal distilled, or common salt converted into soda, waste in some form results from the operations. In every manufacturing process, mechanical or chemical, there is waste. The examples given relate to new waste, but nearly everything we use wears, or corrodes, or gets broken or unshapely, and so rags, and rust, and scraps arise. On the other hand, the rust which arises from corroding iron is utter waste, since it can never be profitably collected at all. In respect to the value of "waste," these two, among familiar things, may be taken as at opposite extremes. There is a kind of waste, for the most part difficult to prevent, which goes on in the consumption of fuel, and in certain processes of roasting or calcination in the smelting of metals. Roundly speaking, the best designed steam-engines and boilers require only half as much coal per horse-power per hour as those less skilfully constructed, and the fuel unnecessarily consumed by bad boiler furnaces is largely wasted as smoke through imperfect combustion. The utilization of blast furnace gases for heating purposes, and the recovery of tar and ammonia also produced by the coal consumed in these furnaces, form an instance of a double saving from the same source. In the report of the chief inspector of alkali works for 1891, it is stated that the plant put up in recent years for collecting tar, ammonia, etc., at 57 Scotch blast furnaces cost \$2,223,000, a sum fully equal to the cost of building the furnaces themselves. The condensing flues, miles in length, connected with some lead-smelting furnaces are modern examples for appliances to condense lead fume or smoke which formerly was allowed to escape, causing much loss of lead.

Some instances of how waste in a solid form arises in working rock and other mineral substances may now be given. In shaping and dressing granite paving stones as much as three fourths of the rock quarried is, in some instances at least, wasted. This waste is as yet only very partially utilized for road metal, and in small chips for "granolithic" pavements. The oil shale of the carboniferous formation in Scotland, from which paraffin (q.v.) and paraffin oil are obtained, was itself looked on as of no value till 1859. Blast furnace slag is now utilized in sev-

eral ways, and in a number of cases the accumulations of other kinds of slag on the sites of ancient smelting works have, in modern times, been again put through the furnace to extract the metals left in them, with profitable results. Some of the refuse from the old silver mines of Laurium has been bought up by capitalists for this purpose. One instance, though not of very recent date, may be given where, by the production of a by-product, a fortune was very quickly amassed. About 1840 Mr. Askin of Birmingham discovered a method of separating cobalt, in the form of oxide, from nickel, two metals which were very difficult to separate. This oxide of cobalt was at first a waste product, but before very long it was put into the hands of potters, who readily bought it up to produce a blue color on their ware, at the then rate of two guineas per pound. Among comparatively recent instances of utilization of by-products and waste products in the chemical industries, we may refer to the importance of the substances now extracted from coal tar (q.v.), and the great value of some of them in the manufacture of dyes. Another example is the recovery of binocide of manganese in the production of chlorine for the manufacture of bleaching powder by Weldon's beautiful process. Formerly for every 100 pounds of bleaching powder made about 100 pounds of the native oxide of manganese were required. Now this manganese is recovered and used again and again in the process, with only a loss of about 5 per cent to make up each time it is returned to the chlorine still. The earlier methods of recovering manganese were not nearly so perfect, and therefore were not much used. A process for the utilization of chemical waste on a great scale is Chance's method, patented in 1888, of recovering sulphur from alkali makers' black-ash refuse.

Passing to vegetable substances, the various materials besides rags used in the manufacture of paper may be first noticed. Straw, wood, and esparto fibre, if not exactly waste products, were at least undeveloped substances before they became, as they now are, so largely used in paper making. Old ropes, flax, and jute mill waste, old or torn pieces of paper of every kind, are all serviceable in paper mills or in the manufacture of millboard. In the pulp of the latter old newspapers bulk largely. Cotton waste is much used by mechanical engineers for cleaning purposes. Sawdust is employed in several ways. Corkcutter's waste has become of high importance in the manufacture of linoleum and cork carpet. From the bark stripped from osier wands the useful medicine salicin is now made. In days not so long past the spent madder of our large dyeworks was suddenly raised from a useless to a valuable material by treatment with sulphuric acid, which converted it into the dye called garancin. Madder itself, which till 1869 held a chief place among our dyestuffs, has since become of trifling importance, through the introduction of alizarin (q.v.). From the seaweed thrown up on British shores iodine is obtained, but, though some is also used as manure, much of it is allowed to decay. One of the most interesting examples of what has been done in converting a waste animal product into a highly useful material is seen in the case of waste silk. Cocoons do not yield half their weight of reeled silk, but the remaining "waste"

WASTE — WASTES

portion has, through the ingenuity of an English inventor, become the raw material for a large spun silk industry. In Venice artificial flowers for ladies' headdresses are made of imperfect cocoons. The various kinds of waste from woolen mills and from the cutting up of woolen fabrics are either worked up again into yarn or felt, or are ground into flock for paper hangings. Glue (q.v.) is made from parings of hide and from bone. The turnings and dust of the ivory and bone turner have various useful applications. Prussiate of potash is made from almost any waste animal matter, such as parings of horns and hoofs, hair, blood, leather cuttings, and even field mice.

Waste, in law, the result of any act or omission by the tenant of any particular estate by which the estate of the remainder-man is rendered of less value. Waste is of two sorts, voluntary and permissive; the former being that caused by active procedure on the part of the tenant, such as the destruction or alteration of buildings, the latter that caused by negligence, such as the allowing of buildings to fall out of repair. On the theory of permissive waste as developed at common law is based the rule which throws upon the tenant the responsibility of making all ordinary repairs in the premises which he occupies. Though he cannot strictly be required to make repairs, and is not liable in damages for any failure so to do, yet in case of an action for waste against him his only defence is a demonstration that he has repaired the waste, and he therefore prefers to maintain the premises in repair.

Wastes, City, Disposal of. The public wastes of a city which must be cared for by one of the municipal departments, commonly the department of street cleaning, consist of street sweepings, dead animals, condemned market material, household refuse—garbage, ashes, and general rubbish; and trade waste—paper, packing material, etc. When these have been collected, it is necessary for the department of street cleaning to make the most economical and least obnoxious final disposition of the various products of its industry. Many, and indeed most, of the materials collected have a definite and considerable value when separate from material of other classes, but a mixture of the various kinds of refuse has no value except the little which can be produced by separating the materials by hand picking.

In any large city the proper treatment of these materials calls for their collection in five separate classes: (1) Street sweepings; (2) dead animals; (3) household garbage and market waste; (4) ashes; (5) household rubbish—cans, bottles, paper, rags, bits of metal—and trade waste. When a city population exceeds say 100,000, the amount of waste is sufficient to warrant this classification, because the resulting economies will counterbalance the attendant trouble and expense of keeping and collecting the materials separately.

(1) Street sweepings consist of about two thirds horse droppings and one third dust and scrap of one kind and another. These sweepings are not satisfactory as a lowland filling because of the large proportion of organic matter; and on the other hand the material has small value for fertilizing purposes because even well kept stable manure has a value of only about \$2

per ton, wholesale, on the basis of the price of manufactured fertilizers; and street sweepings, from their admixture with other dirt, have a fertilizing value of only about \$1.35 per ton. It is evident that such material cannot be shipped far, because its value would soon be equalled by charges for handling and transportation; and the best disposition that can be made of it is to send it out as a farm and garden dressing as far as its fertilizing value will pay the freight. Before the days of high grade fertilizers, such material had a relatively higher value; but nowadays, only in small cities where market gardens and farms are not greatly distant from the centre of population, have street sweepings any commercial value at the point of collection. In 1840 New York city sold its street sweepings and manure for \$38,711; in 1850 the amount received was \$30,898; in 1860 the amount was \$17,928; and all receipts from this source ceased not many years later. In smaller cities, however, while the cost of sweeping the streets will apparently always be a charge on the citizen, the value of the sweepings collected from paved streets ought to pay for their final disposition.

(2) In the matter of dead animals, it is customary to contract with some individual or firm for their prompt collection and removal; and though this is considered a service and is nearly always paid for by the city, yet the value recovered by the contractor from the hides, bones, grease and fertilizer-material goes a long way toward equalling the expense of collection and disposal; and there is good reason to believe that the value of this material when scientifically treated is sufficient to meet the total expense.

(3) The third class, household garbage (q.v.) and market waste, is the division which causes most trouble and expense in any city, large or small. In seaport towns it has usually been cheapest and easiest to tow the mixed wastes to sea and to dump them so far from shore as to be practically unobjectionable. Inland cities and towns, however, have found great difficulty in disposing of organic waste, because the method of disposition adopted must be satisfactory at once to the community and to its neighbors. These municipalities have usually endeavored to sell their edible waste, even if not very fresh, for use as food in large piggeries. Many, too, even within recent years, have used it as food for milch cows. But consumers of the pork and consumers of the milk have gradually risen in protest, and guardians of the public health have urged many reasons why the practice should be abolished. The revenue derived from it and the difficulty of finding a better method have been serious obstacles to change; but the practice has generally given way to the compost heap, which in turn has usually died an early death from the vigorous objections of its neighbors.

When mechanical methods were sought, the first impulse naturally was to *destroy* an article which had been the source of so much danger and trouble; the second impulse was to *save* a substance which was known to be valuable. The development of these two ideas has led to the invention of incinerating and utilization methods, respectively. The term garbage is used here to signify only table, kitchen and market refuse, consisting of animal and vegetable scrap, always wet and putrescible. The composition of this material varies with the season and with

WASTES

the city, but the average in America is approximately: Water, 70 per cent; grease, 3 per cent; solid fibre, 27 per cent. Such material cannot be burned until its 70 per cent of closely-held water has been freed and evaporated; and, on the other hand, its grease and fibre have commercial value if they can be separated from the water and from each other.

Every housekeeper knows that small amounts of garbage can be quickly disposed of by a good fire; but when the endeavor is made to destroy a large amount of garbage by a poor fire, the trouble begins. In all cases noxious fumes are produced, and escape unless the temperature is high—2,000° F. or more, and freedom from offensive odors is gained only at the expense of fuel. The organic fumes must be decomposed and destroyed within the furnace itself, and therefore the process must be one of complete combustion and not mere evaporation or distillation. When a small amount of garbage is mixed with a large amount of paper, excelsior, shop sweepings, and waste coal and clinker, the incineration process is neither difficult nor costly; and is permissible in the outskirts of a town or city where there are no neighbors within a mile to be troubled by the fumes which in practice always escape with the chimney smoke and come to the ground at a greater or lesser distance according to the force of the wind. Many city incinerators for this kind of waste destruction are in use in the United States and Canada; many of practically the same class have been in use in England for a long time, and from there the practice has extended to Hamburg and some other places; but none of these incinerators endeavor to burn pure garbage, but always the mixture above mentioned. As a matter of fact, there is enough heating power in a pound of dry garbage to evaporate the water from the next pound, and therefore there is no reason why a furnace cannot be so constructed that each pound of garbage may dry the next succeeding pound, and garbage thus be made to burn itself, with only enough added fuel to insure the destruction of fumes.

Garbage utilization processes all aim to extract the grease by cooking in steam or in naphtha, after which the solid material or fibre is dried and ground to form a fertilizer base. The recoverable grease amounts to about 60 pounds per ton of raw garbage, and is salable at about 3 cents per pound. The dry fibre averages 540 pounds per ton of winter garbage, and derives its value from the presence of ammonia—18 pounds @ 8c.=\$1.44; phosphoric acid—18 pounds @ 1c.=18c.; potash—6 pounds @ 3½c.=21c., or a total recoverable value of \$3.63 from a ton of raw winter garbage. Summer garbage is less valuable because it contains more water and less grease and fibre. The cost of treatment, when the quantity is large, is less than the value of the material recovered. In American cities the amount of garbage collected averages about a half pound per citizen per day; in Europe it averages less than a quarter pound. Many people object to keeping separate garbage cans because of the odors which arise unless the water is absorbed by a mixture of ashes, paper and other waste; but in a large city where garbage is collected daily, it is evident that material which has come from the table within 24 hours must be odorless and unobjectionable, and that the odors arise solely from the cans, and from

them only because they are not regularly washed and kept clean.

(4) Ashes are always available for lowland filling, and steam ashes are particularly sought by builders for use in fireproof floors, as a foundation for the cement floors of cellars, and as a substratum for sidewalks and flagging. The ash output amounts in the northern parts of America to nearly three quarters of a cubic yard per citizen per year, and many efforts have been made to utilize its various constituents so as to save the cost of carting or boating it away for filling purposes. Ordinary household ash from anthracite coal consists of: Fine ash, 50 per cent; coarse ash, stone and clinker, 30 per cent; coal, 20 per cent. Such recovered coal has a ready cash sale, and while the daily value of the ash from a single building is probably too small to pay for its separation, yet the process may be profitable when conducted on a large scale, in proper buildings, and aided by mechanical means of separation. This recovered coal has an average heating value of about 75 per cent of that of new coal and has many advantages as household fuel because of its ease of ignition, and its freedom from dust, clinker and slate. In the borough of Manhattan, New York, the annual output of ash is not far from 1,500,000 cubic yards, or 1,200,000 tons, and the amount of recoverable coal contained therein is not far from 250,000 tons. If the ash collections are kept free from street sweepings and garbage, the recovery may be made by a machine capable of separating coal from clinker; and the value of the recovered coal will be nearly sufficient to meet the expense of ash collection and disposal.

(5) The class of waste including general rubbish—cans, bottles, old rubber, paper, rags, bits of metal, etc.—is a perennial delight to scavengers, who withstand dust and smells in order to pick out these things from a mixed mass of animal and vegetable refuse. But since city authorities have learned to keep the different classes of waste separate, this rubbish has become a source of revenue to the city even after paying the cost of collection and sorting. Old cans are sold at \$3 per ton for their solder and value as material for cheap castings. Bottles are of two classes, "registered" goods—bottles which have the proprietor's name blown in the glass—and plain bottles without names. The average price, at the place of collection, for "registered" bottles, which by law may be sold only to their original owners, is one cent each. Plain bottles are put into barrels and sold to dealers at \$1.50 per barrel. Broken glass, too, has a market value of 10 cents per bag. Rubber scrap is worth 5 cents per pound at the rubber-reclaiming factories. Waste paper, when clean, is worth from \$4 per ton for newspapers to \$40 per ton for fine white paper, the average price for the paper collections of a city being about \$9 per ton. Rags vary in price, as do papers, many of the rags being used for paper stock. These materials have such value that only a small proportion reaches the carts of the department of street cleaning. The large proportion is collected by house to house visitation by junk-cart men, of whom there are in the borough of Manhattan, for instance, some 400, whose purchases amount to about \$1,000 per day; and only the balance is collected by the department carts. An idea of the extent of the trade in these waste materials may be gained from the statement that

WATAUGA ASSOCIATION — WATCHMAKING

the yearly collection of old rubbers in the United States amounts to about 17,000 tons, of which some 600 tons per year, worth \$50,000, are collected in the borough of Manhattan. Some of the other yearly collections in Manhattan are as follows: "Registered" bottles—principally syphon bottles and those used for carbonated waters, soda and beer—2,000,000, worth \$20,000; plain bottles, 30,000 barrels, worth \$45,000; waste paper, \$2,000,000 worth; rags, \$75,000 worth; bits of carpet, string, iron, brass, etc., to the amount of several thousand dollars more. Though, as said above, only a small proportion of these things goes to the waste heap, yet, since the department has provided separate carts for dry rubbish, the city has received annually nearly \$100,000 for the delivery of these collections to contractors at the docks. The various materials are delivered mixed from each cart, and some \$150,000 is paid annually by the contractors to laborers who sort the waste into separate piles, after which it is sold to various dealers. Allowing a reasonable profit to the contractors, it is probable that the amount received by them is not less than \$300,000. Therefore these bits of scrap thrown away by the housekeeper have become worth \$100,000 by their collection at the receiving station, and have become worth \$300,000 by separation into their component parts.

The problem of the general separation of waste materials is simple in the household but difficult in the community. It is all a matter of education in ethics and community economy, and requires strict rules with sure penalties for infraction. If each member of the population would increase the salable value of his household wastes one half cent per day by keeping these wastes separate, the total amount would be sufficient to defray all the expenses of the department of street cleaning in any city in the United States. See STREET CLEANING.

C. HERSCHEL KOYL,
Consulting Engineer.

Watauga Association, in American history a name adopted by a party of settlers who established the first independent civil government in North America. In 1768, the Six Nations (q.v.) agreed to surrender all the lands between the Ohio and Tennessee Rivers. The first settlers were largely from Virginia and the first settlement was made on the banks of the Watauga River in 1769. The Watauga Association, established in 1772 by John Sevier, James Robertson and others, subsequently grew to be the State of Tennessee. Under the title "Articles of the Watauga Association," a written constitution was drafted, the first ever adopted by a community of American-born free-men. See SEVIER, JOHN.

Watchmaking, Modern. It is an accepted fact of horological history that the portable mechanism from which has been evolved the modern pocket watch had its origin in Germany. And until the last half of the 19th century the watchmaking industry was confined to a few European countries, particularly to Switzerland and England.

The methods employed by all European watchmakers involve a great degree of individual skill on the part of the various workmen, a skill which can be acquired only by years of application and experience. But as it

is the custom in the watchmaking districts of Europe for the children of a family to adopt the line of work pursued by the parents, the acquisition of superior manual dexterity would tend to be both natural and easy. Such skill would, however, lie within narrow limits. For instance, the members of a certain family would for succeeding generations be engaged in the making of a given piece or portion of the watch, one family making wheels, another regulators, another dials, etc. The several parts produced by these various families being brought together by still others, who fitted them to each other and sold them in the form of completed watches. Practically the same methods were in use in the watchmaking districts of England. But while watchmaking in England has to a great extent declined, the Swiss are still largely engaged in the business, but their methods have been materially modified through the introduction of American machines.

It may be properly said that Europeans made watches by long used methods, while Americans made a radical departure from established ways and originated a system, the foundation of which may be briefly stated as the substitution of impersonal machines for the acquired skill of the individual workman. A half century of continued growth has given practical demonstration of the correctness of the theory on which this system was founded. It is conceded to have had its theoretical origin in the mind of Aaron L. Dennison, a young Boston watchmaker, who in 1849, after months of planning and endeavor, succeeded in enlisting the co-operation of Edward Howard and his partner, makers of accurate instruments of various forms. Having secured capital to the amount of \$20,000, they built a small factory in Roxbury, where about four years was spent in preliminary work and in the production of a few hundred watches. In 1854 a new factory was built in Waltham, Mass., about ten miles from Boston. This factory, after numerous changes and additions, now exists as the oldest watch factory in America and the largest in the world. Here really began the manufacture of watches on what is now known as the American system, so that it may fairly be said that modern watchmaking belongs peculiarly, if not exclusively, to America. We have said that the American system of watch manufacture employed machines as a substitute for the acquired skill of the individual workman. But the foundation of the system is that of practical uniformity in the measurements of large numbers of any given parts of watch movements, so as to permit of interchangeability.

Manufacturing on the basis of interchangeability may be said to have been in its infancy at the middle of the last century. Doubtless that system had its finest exponent at the time in the United States armory at Springfield, Mass., where were manufactured muskets for the use of the army. Mr. Dennison believed that, notwithstanding the diminutive character of watch parts, as compared with muskets, it would be possible, by the employment of suitable machines, to manufacture large numbers of such parts of such exact uniformity as to be readily interchangeable. The original American watch factory was therefore planned on that theory. But to fully equip a watch factory with tools and machines capable of producing work

WATCH MAKING MACHINERY.

1 Automatic Watch Plate Recessing Machine.
3 Automatic Watch Plate Facing Machine.

2 Automatic Screw Making Machine.
4 Automatic Pinion Staff Turning Machine.

WATCHMAKING

in that systematic way, would involve the employment of very large capital. The original factory was not fortunate enough to command sufficient confidence of capitalists to enable it to do more than make a beginning, but accomplished enough to demonstrate the practicability of the system. Its development has, however, been continuous, until at the present time machine watchmaking has to a limited extent been adopted in Switzerland, while the old methods of manufacture in England have declined to such an extent that there now remains but a small per cent of the former business.

A watch is really quite a simple machine, containing an average of about 150 distinct parts. By actual count it has been found that the production of all these parts requires over 3,700 distinct operations. It will, therefore, be readily understood that the manufacture of watches on an extensive scale is one of the most complex and exacting manufacturing problems ever undertaken. It calls for high grade talent in almost every direction, and involves an intricacy of detail which can be mastered only by years of study and experience.

This being the fact, it will be hopeless to attempt more than a brief and fragmentary description of a few of the manufacturing processes involved; and it should be understood that the methods employed, and the means used, are not identical in all American watch factories, but doubtless they are as diverse as the factories themselves. It will therefore be best to indicate the most advanced methods only, which in the nature of the case can be found only in a large factory, possessing the absolute requisite of plenty of capital; for high grade automatic machinery is of necessity quite expensive, while at the same time its productive capacity exceeds the requirements of a small factory.

Beginning then with the foundation of the watch movement—the “pillar plate”—it should be said that these larger parts (which in the cheaper grades of watches are of brass, and in the better grades are of nickel alloy) are made at brass mills, from dies furnished by the watch factories, and are received in the form of blank “punchings.” After these blanks have been carefully cleaned they are placed in a tubular magazine located at one extreme of a “facing machine” directly beneath a “carrier,” which is attached to the extremity of a swinging arm. When the machine is put in motion the carrier descends and grasps one of the plate blanks and lifts it clear of the magazine and swings around to a point directly in front of a suitable chuck or holder on the running spindle of the machine, which at that instant is not in motion. The carrier then descends until the blank is in exact line with the axial centre of the spindle. When in this position the chuck is opened to receive the blank, which is pushed into the waiting chuck, which immediately closes tightly upon it. The carrier then rises and swings to a position midway of its excursions. The spindle then begins to revolve at a suitable speed, and at the same time moves forward so as to bring the revolving blank into the path of a suitable cutting tool which at once commences to move toward the axial centre, cutting away a definite portion of

the blank, and leaving it with a perfectly flat and smooth surface. As soon as the cutting tool reaches the centre of the blank, it is withdrawn from contact and returns to its former position. At the same time a second carrier swings around from the opposite side and places itself directly in front of the chuck containing the faced blank; the grasp of the chuck is relaxed and the blank is pushed out of it and into the second carrier which at once swings around and deposits it in the chuck of a second running spindle—a duplicate of the first. In this second position the other side of the blank is faced; then a third carrier takes the now double-faced blank and deposits it in a receptacle at one end of the machine.

As the movements of the three carriers are simultaneous, and the cutting tools move in unison also, it will be seen that notwithstanding the numerous operations which succeed each other, a completed blank is deposited at one end of the machine at practically the same instant that another one is taken at the other. Slight modifications in parts of the machine provide for desired recesses on either one or both sides of the blanks. These machines do their work on plates at the rate of 1,800 per day, so that it will be seen that they are far too productive for any watch factory which is not organized for a large output.

Succeeding the facing operations, just described, comes that of drilling most of the numerous holes in the plate needful to receive the screws, pins, etc., for attaching the “top plate,” balance cock, pallet bridge, etc. The ordinary method of drilling has been to clamp the blank watch plate to a master plate or “drill jig,” in which were the required holes of proper size and accurately located, which holes served as guides to the various drills required. But inasmuch as the number and location of holes in such a jig were necessarily quite limited there was involved the use of several jigs to complete the drilling on each and every watch plate. Of course also an operative was required to insert and remove the plates and to manipulate the drills. Following the operations of drilling there is required the “threading” or tapping of certain holes for the reception of screws. This operation involved the repeated handling of the plates.

D. H. Church, the mechanical superintendent of the American Waltham Watch Factory, in addition to other machines in great variety, has invented an automatic plate-drilling machine capable of both drilling and tapping practically all of the holes in the watch plate, in which the only work of the attendant is to fill with blank plates the magazine at one end of the machine and remove them from a similar magazine at the other end, where they are automatically deposited, completely drilled and tapped. In some instances the operations performed on each plate number 135, and the plates are delivered at the rate of one in 90 seconds.

Following the drilling of the plates comes the turning of the required recesses in both sides to make room for some of the moving parts of the watch, such as the main-spring barrel and some of the wheels of the “train.”

The automatic recessing machines are also provided with delivering and receiving maga-

WATCHMAKING

zines located at the extreme ends of the machines, and between them are a number of parallel heads each provided with a running spindle and "chuck," and in suitable relation to each a compound slide rest carrying a special cutting tool adapted to the work to be done. Carrying arms automatically take the plates from the magazine and the successive chucks and transfer them to the next in order. But this transfer must be done with the utmost exactness, for the plates must be so held in the various chucks that the axis of revolution shall in each successive operation be in a new but definite part of the plate. Moreover, the plates are located and kept with utmost precision in their proper position by guide pins in each of the clamping chucks, which pins correspond in relative position with certain of the drilled holes in the plates. It is needful therefore that, as the plate is presented to each succeeding chuck, its guide pins shall be exactly in the proper position to enter the hole in the plate. The attempt to attain the required exactness of movement was regarded at first as a bold one, but complete success justified the hopes and expectations of the inventor.

The other supporting plates of the watch are treated in the same manner as the pillar plates above described, their differing forms of course demanding correspondingly differing chucks and holders.

For numerous succeeding operations of boring, turning, milling, etc., special machines are provided, many of them being exceedingly interesting in their intricate movements, but impossible of any brief description.

The American system includes the production of every portion of the watch in one establishment, but in very few even of the American watch factories has this ideal been attained. The fact that certain components of the watch, such as dials, hands, mainsprings, etc., which do not demand extreme exactness in fitting, can be imported from Europe, or produced in special factories, has enabled a number of incomplete factories to turn out watch movements, in considerable numbers, without the investment of large capital. But the original American watch factory is equipped for the production of every part of the watch movement, down to the delicate little taper pins used to confine the ends of the hairsprings. By means of special machines these little pins are made at a rate exceeding one in two seconds. Even the fragile enamel for coating the dials is manufactured from the raw materials; as also the pure gold ornaments used to embellish "fancy dials." These things, however, do not demand the extreme accuracy which makes watch manufacturing so extremely trying.

It may be proper at this point to speak of one feature of watch manufacturing which might seem to show incompleteness in the "system." For many years the original American watch company manufactured watch cases as well as movements. But as their watches grew in favor, new watch companies were created, and as those new companies did not attempt the making of complete watches, other factories were organized for the exclusive manufacture of watch cases. As movement making has increased, case factories have also been multiplied

to an extent hardly warranted by the production of movements. All case factories, however, of necessity conform to the standards of measurement furnished by the movement makers, and those standards are so practically uniform that regular cases of all makers will fit corresponding movements produced by any of the regular watch companies.

This systematic method of manufacturing to standard dimensions is of exceeding importance to watch dealers, and the purchasing public also, as the customer is thereby enabled to select a watch movement of any desired size or grade, and also to select from a variety of cases one of such style or weight as best suits his taste. The ability to make independent selections of movement and case is one of the advantages of modern watchmaking made possible by the American system.

The use of automatic machines was applied to the manufacture of the smaller portions of the watch much earlier than to the production of the plates, as above described, indeed, it may be said that some of the earliest machines employed were semi-automatic. But so radical have been the changes and improvements instituted within the last 15, and especially during the last eight years, that methods previously used can hardly be considered as modern watchmaking.

One of the most interesting of those which are strictly modern is one for the turning of the delicate arbor on which is mounted the most swiftly moving wheel of the entire watch, the "balance." The fact that this wheel moves with such rapidity, together with the fact of its location at the farthest point from the reservoir of power, in the mainspring, makes it absolutely essential that it should be subject to the least possible amount of running friction. Consequently the pivots of this "balance staff" are exceedingly minute. It is of course an absolute necessity that every portion of the staff, including the delicate pivots, should run absolutely true. Exact truth was a difficult attainment under the methods ordinarily used, although great care was used to avoid any stress or distortion of the staff, by a very gradual reduction of the blank, so that 10 to 14 separate turnings were required to complete a staff. By the most approved modern methods and machines, all of the required turnings, including the pivots, are performed before the completed staff is severed from the rod of wire from which it is made. So complete is the machine, and so accurate and rapid is its operation, that a staff is delivered from the machine each 90 seconds.

The pinions of various sizes, which compose so large a portion of the time train of the watch, are formed from the best quality of steel rods, and, as this wire must of course have a diameter as great as the largest part of the pinion, it follows that a large proportion of the material must be removed to bring the pinion to its finish dimensions. An early method consisted in first cutting the wire into blanks of sufficient length, then to insert those blanks in a suitable chuck in the running spindle of a lathe, and with a suitable tool to remove the metal from the projecting end so as to bring it to an accurate point or centre. The blank was then reversed in the chuck and the opposite end pointed in like manner. In some instances a

DIALS OF FRENCH WATCHES OF 16th AND 17th CENTURIES

WATCHMAKING

portion of the excess metal was removed in connection with the operation of pointing.

Following this somewhat crude method of pointing and initial turning, came the invention and adoption of so-called "roughing out machines," in which a rod of wire is inserted in the machine which automatically cuts off, points and turns the blanks on both ends and delivers them uniform in dimensions and requiring only the slight finish turnings and the cutting of the teeth when they will be ready for hardening and tempering.

A later form of machine has been devised, which takes a rod of wire at one end and delivers the pieces "finish turned" at the other end.

The finished blanks are then placed in a magazine or "feeder" in a cutting machine which automatically takes them one at a time and forms the teeth of the required number and shape, the work of the attendant being to keep the magazine supplied with blanks, and to examine the pinions occasionally in order to detect any imperfections; so that a single person can easily attend six cutting machines. For the greater convenience and comfort of the operator a chair is fitted to run on rollers on an iron track on the floor. These rolling chairs are also provided in connection with numerous other machines where a single person attends to a number of machines.

Within two or three years D. H. Church of the Waltham factory has created machines in which pinions are completely turned and the required teeth are cut. All the work being automatically performed, so that completed pinions are made, the last operation being to sever the finished pinion from the rod of wire from which it was formed. The exactness with which these machines operate makes possible the production of pinions which could not have been produced with tools and machines in previous use.

The limits of this article preclude more than the brief mention of a few of the features which are peculiar to modern watchmaking. Only one additional class of machines will therefore be mentioned. As each watch movement requires from 30 to 50 screws it will be evident that for a daily product of more than 2,500 watches more than 100,000 screws would be required. By the earlier methods employed in American watch factories an active man could make from 800 to 1,200 screws per day so that more than 80 men would be required for the production of this large number. But within a few years screw-making machines have been devised which are capable of making from 4,000 to 10,000 screws each per day, and being entirely automatic in action, a single attendant is able to attend six or more machines.

The almost absolute uniformity in the operation of the most improved modern watchmaking machinery insures a resulting product so uniform in quality and dimensions as to make needless the minute "fitting" operations which are indispensable in work produced by even the earlier American methods. So accurately is the work performed that many of the most delicate portions of the watch, whose exact performance is absolutely essential, do not come together until all the finished parts meet for the final assembling.

It may appear strange, but it is nevertheless a fact that, by modern methods, watches

are not made by watchmakers, as that term is generally understood, but by machines. But when the numerous portions of the mechanism are made and assembled, the work of the skillful watchmaker begins; for he it is who by means of the skill and judgment, which come from experience, is able to discover the individualities and peccadillos of each movement, and so remove any crankiness that its performance shall be satisfactory. In the better grades of movements there may also be required certain manipulations to "adjust" the watch so that errors of position and temperature may be compensated for.

It has already been said that the manufacture of watches by modern, that is, by American methods, is a very complex business, involving the employment of large capital and demanding the highest executive and mechanical talent.

For lack of some or all of these prime requisites a large number of watch factories in America have met with fatal disasters. But notwithstanding the multitude of such failures, and the further fact that not until after years of struggle and financial loss did any of the now existing watch factories receive any profitable returns whatever, there yet seems to be a peculiar fascination in the idea of watchmaking, so that new factories are still being organized. The wonderful business prosperity of the past few years in the United States has created a demand for watches which the more advanced factories could not possibly meet, and has given an opportunity for the smaller and poorer equipped factories to profitably market their relatively small product. It is gratifying to the pioneers of the American system to find that the superiority of machine-made watches is being recognized throughout the world.

The enormous growth of the railroad business in the United States and the greatly increased speed at which trains are now run has made absolutely necessary a standard of time and a high degree of accuracy in the running of all time pieces which are in any way connected with the running of trains. These new and exacting requirements are met by a few high grade watches with special adjustments to position as well as temperature. The natural effect of the requirements of the railroad time service has been to establish a higher standard of accuracy in rate for watches for the general public, and as there can be no arbitrary standard for comparison, or for reference, the ultimate and the absolute standard is found in the movement of the stars.

Very properly the United States government, by means of its astronomical equipment, at its naval observatory in Washington, is able to conduct the required stellar observations, and through the agency of the Western Union Telegraph Company distribute accurate time signals throughout the entire country. Previous to the establishment of this government system of time service, the American Waltham Watch Company had established an observatory with a complete equipment of instruments for observing and recording the stellar movements by which to compare its watches. This equipment consists of a fine transit instrument and recording chronograph made to order by the famous firm of Alvin Clark & Sons, together with two fine mean time clocks having gravity

WATCHUNG MOUNTAINS—WATER

escapements, made in the American Waltham Watch Company's factory, and in addition to these, another clock regulated to sidereal time. From one of the mean time clocks time signals are constantly transmitted to all parts of the factory. This feature of providing accurate timing standards is peculiar to modern watch manufacturing, and so far as is known no watch factory in the Old World is equipped in this manner. But, on the other hand, the Royal Observatory at Kew, England, and the Government Observatory at Neuchâtel, Switzerland, undertake the testing of the limited numbers of watches submitted by the manufacturers of those two countries.

In conclusion, it may be said that notwithstanding the two or more centuries of priority and experience enjoyed by European watchmakers, their extreme conservatism has allowed them to be outstripped by the more progressive manufacturers of America, so that modern watchmaking is at the present time, and in its most advanced form, an exclusively American achievement.

E. A. MARSH,

General Superintendent American Waltham Watch Company.

Wat'chung, or Orange, Mountains, in New Jersey; a range of hills west of Paterson, Plainfield, and Orange, extending north and south, but curving westward at each end. Length, about 40 miles. There are three divisions of the range, each composed of trap-rock, which was a lava flow about the time other portions of New Jersey were in a more advanced stage of formation. The mud and sand covering followed, and now the ranges are mostly shale and sandstone. The trap-rock, in places, forms elevations from 300 to 400 feet high, the soft sedimentary beds once enclosing it, yielded more rapidly to erosion. There is a similarity in the material composition of the Watchung Mountains and the Palisades, the difference being more in the direction of the original lava flow. The Palisades sheet was not a surface flow, but was forced between the sedimentary beds.

Water, a universally diffused liquid, the true nature of which was not discovered till toward the close of the 18th century. In 1781 Cavendish carried out a series of experiments by detonating mixtures of common air and hydrogen, or dephlogisticated air, as it was termed. He showed that by regulating the relative quantities "almost the whole of the inflammable and dephlogisticated air is converted into pure water." Although Cavendish showed experimentally that water is produced by bringing together oxygen and hydrogen, yet to Lavoisier, who received information regarding Cavendish's experiments, must be assigned the merit of interpreting aright the experimental results, and of proving that water was a compound substance—a compound of hydrogen and of oxygen.

Water may be produced by exploding a mixture of two volumes of hydrogen with one volume of oxygen; by passing hydrogen over many heated metallic oxides; and in various other ways. It exists, although never in a perfectly pure state, in immense quantities in nature. The composition of water has been determined by two distinct methods: (1) by volumetric synthesis; (2) by gravimetric synthesis. In volumetric synthesis of water measured volumes

of pure dry hydrogen and of pure dry oxygen are mixed, and the mixture is exploded by the electric spark while standing over mercury; the residual volume of gas is then measured; it is found that two volumes of hydrogen invariably unite with one volume of oxygen. In the second method a weighed quantity of a metallic oxide (usually cupric oxide) is decomposed by means of pure dry hydrogen at a high temperature, and the water which is produced is weighed. The decrease in weight of the oxide gives the quantity of oxygen in the water formed; while the difference between the total weight of water and the weight of the oxygen gives the weight of hydrogen used. It is found that 16 parts by weight of oxygen are always united with two parts by weight of hydrogen to form 18 parts by weight of water. As 16 is taken to be the atomic weight of oxygen the formula of water is H_2O .

Water is a colorless, tasteless, inodorous liquid. At all temperatures below 0°C . it is a solid, and at all temperatures above 100°C . it is a gas. When water at 0° is heated it contracts until it reaches the temperature of 4°C ., after which it expands; conversely, when water at 100° is cooled it contracts until it reaches the temperature of 4°C ., after which it expands; 4°C . ($=39.2^\circ \text{F}$.) is called the point of maximum density of water; the specific gravity of water is greater at this than at any other temperature. The fact that water expands on cooling from 4° to 0° is a most important one. If a sheet of fresh water be cooled, the upper layers become more and more dense; they therefore tend to sink, and so fresh surfaces are exposed to the cooling influences. But when the temperature of the mass of water has reached 4° and further cooling of the surface causes an expansion of the upper layers, which continues until these become ice; these layers of cold water consequently float upon the warmer water underneath; hence it is impossible for the mass of water to suddenly freeze throughout. When water passes from the liquid to the solid state it expands to the amount of about 1-11th of its volume. This expansion is sufficient to bring about a large quantity of mechanical work; and to it the bursting of water-pipes during frost is to be largely traced. When solid water becomes liquid, or when liquid water becomes gaseous, a considerable quantity of heat is rendered "latent." Steam issuing from boiling water is no hotter than the water itself; water formed when ice is melting is no hotter than the ice itself; yet heat is being communicated to the ice and to the water. The latent heat of water is 79 thermal units; the latent heat of steam is 536 thermal units. In other words, in order to convert unit weight of ice at 0° into water at 0° a quantity of heat must be communicated to the ice, which, if communicated to unit weight of water at 0° , would raise its temperature to 79°C . In order to convert unit weight of water at 100° into steam at 100° such a quantity of heat must be communicated to the water as would suffice to raise the temperature of that weight of water through 536°C ., or 536 times that weight of water through 1°C . Before water can become steam the upward pressure of its vapor must overcome the downward pressure of the atmosphere; hence it follows that the boiling point of water is conditioned by the atmospheric pressure. Water boils at a much lower tem-

WATER

perature on mountain tops, where the pressure is comparatively small, than in the valleys.

The solvent power of water is very large. As a rule hot water dissolves larger quantities of solid matter than cold. As has been mentioned water is never found in nature in a state of purity. The different kinds of natural waters may be divided into three groups: (1) Rain water; (2) river water; (3) spring, including mineral water and sea water.

Rain water, when collected before it touches the earth, contains only such impurities as may be derived from the atmosphere, chiefly consisting of oxygen, nitrogen, and carbon dioxide. The rain water of towns contains comparatively large quantities of acids and of soluble salts. The amount of these substances may be taken as an estimate of the comparative purities of the atmospheres of different towns. Rain water collected near the sea is rich in chlorides.

River water varies greatly in so far as the nature and quantity of the substances held in solution by it are concerned. The soluble constituents of river water are chiefly such as may be derived from the rocks through which the water of the springs which have fed the river has percolated. The dilution of the original spring water by the continual influx of tributaries reduces the relative quantity of solid matter held in solution, while the escape of carbon dioxide during the exposure of the surface water to the air causes the precipitation of those salts which were held in solution by the aid of the carbonic acid. River water is often largely contaminated by the drainage of towns or of manufacturing factories situated on the river banks.

Spring Waters.—The soluble constituents of spring waters are very various. In some springs the quantity of dissolved solid matter is but trifling, while in others it amounts to 2,000 grains per gallon. Spring waters are usually divided into classes in accordance as one or other dissolved constituent predominates. See MINERAL WATER.

Sea water is essentially an alkaline chlorinated water. The quantity of solid matter held in solution varies in the waters of different seas. Inland seas, as a rule, contain less solid matter than the ocean; thus the solid content of the water of the Black Sea amounts to about 1,760 parts per million, while that of the Baltic averages 17,700, and that of the Atlantic Ocean 36,000 parts per million. The constituents of sea water are chiefly chlorides and sulphates of sodium, magnesium, and potassium, together with bromides and carbonates, chiefly of potassium and calcium.

Use of Water.—In considering the suitability of a water for domestic use attention should be principally paid to (1) the source of the supply, (2) the total solid matter held in solution by the water, (3) the organic matter held in solution, and (4) the action which is likely to be exercised on the water by the means of supply. Let us consider these points briefly. In examining the source of a water supply attention should be especially paid to the proximity of drains or sewers of any description, and to the likelihood of contamination from these sources. The nature of the soil through which the water percolates should also be inquired into. The solid substances held in solution by a sample of water may be estimated by evaporating a measured quantity of the water to dryness in a platinum

basin heated by steam, and weighing the residue. From a knowledge of the total solids in a water, unaccompanied by any further information, no reliable conclusion as to the suitability of such a water for potable purposes can be deduced. In seeking to determine whether a sample of water has undergone contamination with hurtful organic matter the following points are to be more particularly attended to: (1) Estimation of the amount of chlorine, whether existing as hydrochloric acid or as a chloride; (2) estimation of ammonia; (3) estimation of nitrates; and (4) detection, and estimation, if necessary, of poisonous metals. The presence of an undue amount of chlorine generally points to contamination with animal matter. Pure waters do not as a rule contain more than three to four grains of chlorine per gallon. It must, however, be borne in mind that such waters as flow through a soil rich in chlorides—such, for instance, as the waters found in the neighborhood of the Cheshire salt-beds—always contain large quantities of chlorine. The sudden appearance of chlorides in a water previously free or nearly free from these substances points to animal contamination.

Ammonia may be obtained from most waters by distillation after the addition of a little sodium carbonate; when the whole of this ammonia has been driven off it not unfrequently happens that the addition of an alkaline solution of permanganate of potassium and heating results in the production of a further quantity of ammonia. The ammonia obtained by the first distillation is usually spoken of as "free ammonia," while to that obtained by the second distillation the name of "albumenoid ammonia" is given. The presence of even small quantities of albumenoid ammonia points unmistakably to organic contamination. Such ammonia is derived from the decomposition, by the agency of the alkaline permanganate liquid, of nitrogenous matter of animal or vegetable origin. Pure water should not contain more than 0.10 parts of "free" ammonia per million, nor more than 0.08 parts of "albumenoid" per million.

If nitrogenous matter has become thoroughly oxidized it gives rise to the formation of nitric and nitrous acids. The presence of these acids or of their salts, therefore, generally points to previous contamination of some organic nature. As, however, these things are the harmless—that is, in the quantities in which they occur in waters—products of the decomposition, and therefore of the removal, of hurtful substances, their presence, even when in comparatively large quantities, ought not of itself to condemn a water. The poisonous metals which are most likely to occur in drinking waters are lead and copper. These may be easily detected and estimated even when present in exceedingly minute quantities. For details of the analytical methods of water analysis reference must be made to manuals of applied chemistry. It is evident that in a water analysis we look for symptoms of a disease; not for substances which are in themselves hurtful, but for substances whose presence is associated more or less invariably with others, the action of which upon the system cannot but be most pernicious.

In storing water for domestic purposes the water may undergo contamination from the vessels containing it or from proximity to drains or other places emitting noxious gases. It is

WATER

certain that water exercises a solvent action upon lead; but our ordinary leaden water cisterns become coated with a comparatively insoluble compound of lead, so that the danger of contamination from this source is not great. Hot water should never be stored in leaden cisterns; it very quickly corrodes and dissolves the metal. Aerated waters act rapidly on lead; for this reason they should never be prepared in leaden vessels. The solvent action of water on copper is very small. The system of storing water for drinking or cooking in cisterns close to, or even communicating with, the house drainage system, is a very bad one. (See SANITARY SCIENCE AND PUBLIC HEALTH.) In some circumstances, as in the case of swimming-baths, large quantities of water have to be heated to a certain temperature and kept at the same for a considerable time while the water has to be maintained in a due condition of purity.

Water, Its Relation to Disease. Water is a necessary element for the maintenance of the life of both plants and animals. It is technically a food and is as necessary as food. It serves as a diluent and as a solvent and as a necessary ingredient of the plasma of the cells, maintaining the cell turgor and influencing partly by its chemical, partly by its physical properties, the osmotic tensions in the cells necessary to their healthful functioning. For most individuals two to three pints of water a day are necessary; many need more, most people are healthier if they drink at least two quarts of water a day, in addition to the water of their food. Each and every individual in a community, however, makes use of a much larger amount of water than this. The domestic uses of water are numerous. Cooking, washing, bathing, etc., consume much. The care of streets, of stables, of animals, etc., requires it; in short, the amount needed per person in the population, instead of the two to three pints mentioned, for all purposes amounts, according to Parkes' original calculation, to at least 12 gallons per day. His is a very small allowance, judged by modern American standards. Twenty to 40 gallons per day per person is a better allowance, even 50 is not too much. Excess amounts are often wasted to the detriment of the health of the people. Towns and cities need a greater water supply per person than do villages and small communities. It is an interesting comment that in small towns in which a public water supply has been established, the amount of water at first used is within the economic limits; but in a few years, if the supply is unlimited, the inhabitants soon learn to waste more than they originally used. In large cities like New York, Chicago, or Philadelphia, it has been estimated that the supply is really extravagant, three to five times the maximum requirements, and yet the politicians are constantly building new reservoirs. For many domestic purposes it is necessary to use pure water. Sea water may be used for street cleansing purposes, for fire engines, and many manufacturing purposes. Whereas for special reasons a dual system of water supply may be necessary it has been found better and cheaper to have one good supply and watch it carefully for its purity. Pure water, is really almost an impossibility. Pure and impure are only relative terms. A pure water does not exist in nature—gaseous or solid ingredients are al-

ways in solution in even rain water. All natural waters are therefore somewhat impure, but by usage a water is called pure when it contains nothing injurious to health. In order to arrive at some conclusions regarding the purity or impurity of water, and their relations to health and disease a brief glance at the sources of a water supply are necessary. Most of the water comes from the ocean. At least three fourths of the entire earth's surface is covered with water. The evaporation from the surface of the ocean is the original source of the inland waters. The winds blowing the moisture collect it according to well known meteorological laws and ultimately this same moisture falls as rain, the purest form of water in nature. It contains a certain amount of dissolved gases, nitrogen, carbonic acid, some sulphur, etc., with suspended matters from the air, the rain falling earliest in the shower, particularly after a drought, being very rich in the stuff from the air—dirt, soot, insect remnants, etc. As collected from the tops of houses, etc., such water is at first very filthy. Innumerable sources of contamination by the ordure of birds, dead insects, the dirty dust of the roads, etc., these are all washed down into the cistern. They may not be dangerous to health, but such water is not inviting to the imagination at least. Certain cities have to depend entirely upon such collections for their supply. Special devices for the cleansing and protection of these water supplies are in vogue. Lead containers are to be avoided for such water supplies. Rain falling in semi-rocky and mountainous regions usually gives the best kind of a water supply. There is enough foliage and open rock and stone to well aerate and filter such waters, and forming lakes or springs as they do, such make ideal sources for a water supply. In many regions, particularly in some parts of England and Scotland, peat abounds in such regions, giving a distinct brownish and peaty character to the water supply. The water is perfectly good, but has a much more acid reaction than most natural waters. This renders it an unsafe water to be conveyed in lead pipes as it dissolves the metal readily and causes lead poisoning. Much water falls upon gravel or dirt and collects some 10 to 50 feet below the surface—constituting a subsoil water supply. Most wells use such subsoil waters. These waters in themselves are not necessarily bad, but they readily become so by reason of pollution of the soil by privies, etc., often too near the well. This polluted matter is slowly carried to the water supply and frequently results in the spread of typhoid fever. If one patient should have the disease it might go through a whole township because of one infected well. River waters are usually mixtures of spring waters, surface waters and subsoil waters. Where there is little or no pollution because of no inhabitants in a region, such waters, if clear, are usable, but river waters need constant watching to prevent contamination. Water from deep driven wells is usually very pure. It may be impregnated with salts of various kinds making it unpleasant, but such waters are usually free from the germs of infectious diseases.

The disorders, diseases, etc., that may result from waters may be grouped into two main classes: those causing disease or disorder because of certain chemical constituents in or properties of the water—chemical salts, etc.,

WATER ALDERS—WATER-BEETLES

and those diseases due to infectious micro-organisms, animal or vegetable, which may be in the water used. In the first category there may be included goitre, lead poisoning, zinc poisoning, chronic constipation and diarrhoea. In the second various intestinal parasitic diseases, typhoid fever, cholera, dysenteries, diarrhoeas, etc. The evidence bearing on the relation of goitre to certain chemical constituents in the water supply is not conclusive. The famous case of Bozel reported on by a French commission is of importance. In Bozel in 1848 there was a population of 1,472, of whom 900 had goitres. Saint Bon, a neighboring village, had not a single patient with the disease. The water supplies were different. The Saint Bon water supply was then carried to Bozel and in 1864 there were only 39 persons in Bozel afflicted with the disease. A magnesium limestone formation was the most important factor in the water of Bozel. This was absent in the Saint Bon region. Other investigators in India have thought that the goitre resulted from a parasite found in certain waters. The true status is not yet settled.

Lead poisoning is not infrequent. Many soft waters act on lead piping, particularly in newly fitted houses, and the small amount dissolved often results in the listlessness, anæmia, constipation, colicky pains, and even paralyses at the wrists so characteristic of lead poisoning. Kidney disease, stillborn babies, and even insanities may result from such lead poisoning through a water supply. Zinc poisoning has been known, but it is a curiosity. Chronic constipation is very frequently the result of drinking waters impregnated with iron salts and from drinking very hard water, while very soft waters and waters in which there are traces of sulphuretted hydrogen often cause excessive diarrhoea.

The most important water-borne disease, however, is typhoid fever (q.v.). In this, as is well known, the disease is an infectious one. The micro-organism causing the disease, the *Bacillus typhosus*, has found its way into the water supply and from there into the patient's body. It may have come from the drinking water, very frequently from milk, the cans containing which have been rinsed out in infected water; the ice may have been the water infected. Water infection is not the only source of typhoid fever spreading. It is an important one, however, and is the most conspicuous in certain epidemics, but as a rule direct contagion, from person to person, is the most important element in the spread of this disease. Of the means to avoid the spread of this disease, and the modes of contagion, consult TYPHOID FEVER. No patient ever gets typhoid from anything else except typhoid. It does not come "of itself." Cholera is undoubtedly a water-borne disease. Numerous practical experiences have demonstrated this—recent epidemics at Hamburg and Altona in Germany having given conclusive testimony. "Drink boiled water" is the watchword in infected cholera or typhoid regions. Everything coming in contact with the alimentary canal should be cooked.

Various parasitic bacteria may cause dysenteric and diarrhoeal disorders. Most instances of epidemic dysentery are examples of water infection. In armies most frequently contact infections, the *Bacillus dysenteriae* of Shiga, is known to be an important micro-organism in the

spread of epidemic dysentery. The most important of the parasitic worms that may be conveyed through drinking water are the round worm and the pin worm, but there are a number of rare parasitic worms thus conveyed. The eggs of both the round worm and pin worm are frequently found in drinking water derived from the subsoil and surface, and even more commonly communicated in vegetables such as lettuce, beet tops, etc., which are not thoroughly washed. Manured garden fields are the prolific sources of the eggs. Other intestinal parasites are guinea worms, whip worms and hook worms, *Filaria sanguinis*, *Bilharzia hæmatobia* and *Rhabdonema intestinale* are other rarer worms. See DYSENTERY; TYPHOID; CHOLERA; PARASITES, INTESTINAL. Consult Harrington, 'Practical Hygiene'; 'Encyclopedia Medica,' article on 'Water.'

Water and White Alders. See CLETHRA.

Water Balance, an oscillating pendulous frame, having a series of troughs in vertical series and inclined in alternate directions, so that, as the frame oscillates, the water dipped by the lower one shall be poured into the next above, which, on the return motion, shall pour it into the next, and so on.

Water Barometer. See BAROMETER.

Water-bears. See TARDIGRADA.

Water Bed, a contrivance for relieving any partial pressure of the body of a patient long confined to bed, and so preventing the formation of ulcers which arise from such local pressure. These beds are of various kinds. One form is that of a trough half-filled with water, covered by a loose lining of india-rubber sheeting attached all around to the upper edge of the trough so as to be watertight, a mattress being laid between the invalid and the lining. Another form is that of a large waterproof bag which is laid upon an ordinary mattress and half-filled with water, the weight of the body resting upon this directly or with bed clothes between.

Water-beetles, the numerous species of beetles which inhabit water. A common mode of life does not indicate blood relationship, and the various aquatic beetles belong to a number of quite distinct families. Besides those which are aquatic throughout their lives quite a large number of beetles live in or near the water only during the larval period. The strictly and permanently aquatic beetles belong chiefly to three families. The diving beetles (*Dytiscida*) are predaceous throughout life and represent in the water the *Carabida*, to which they are somewhat closely related, on land. The legs in these insects are adapted for swimming, the two hinder pairs being flattened and fringed with hairs. The body is oval and flattened. The mandibles are short and strong, and the thorax is broad. The front legs are short and the antennæ long and filiform. In the genus *Dytiscus* the tarsi of the males are wide, flat, and provided with sucking disks, while those of the females are unmodified. Moreover, the females are of two forms, the one having the wing-covers smooth, the other grooved. The head is short, and received into the thorax. *D. fasciventris* is the common water-beetle of our

WATER-BOA — WATER COLOR PAINTING

ponds. These insects carry a supply of air for breathing beneath the *elytra* or wing-covers. At evening they fly in the air. They are eminently carnivorous in habits, and feed on other insects. The larvæ are active creatures, and are also aquatic; their noteworthy rapacity has gained for them the name of water-tigers, which they well merit, for they will not hesitate to seize in their sharp sickle-like jaws any insect-larva, small fish, or tadpole that comes within reach, and after draining its juices discard the dead body. The tail is terminated by a pair of respiratory tubes which are raised above the surface of the water to effect respiration. Besides this large species the family includes numerous small ones having similar habits. The other two families have club-shaped instead of filiform antennæ.

The *Gyrinidæ*, or whirligig beetles, have the antennæ short, the front legs long, clawed, and in the males provided with a spongy disk, the second and third pairs of legs very short, broad, and paddle-shaped, and the *elytra* do not cover the tip of the oval body. They derive their familiar name from their peculiar habit of describing circles on the surface of the pools they inhabit. When alarmed these insects dive to the bottom and anchor themselves for a time by means of the strong front legs, carrying with them a small bubble of air on the tip of the abdomen. Owing to the smooth, polished, and oily surface they are unaffected by the water. The facets of the compound eyes are divided into two groups on each side, one adapted for vision in the water, and looking downward, the other for looking upward in the air—an important adaptation to the peculiar mode of life of these insects on the surface. When handled the whirligigs emit from the joints a peculiar strong-smelling milky fluid. Although, like the *Dytiscus* larvæ, the young of the whirligigs are predaceous and their appearance is totally different; they are of slender form and, instead of a single pair of caudal respiratory tubes or gills, they bear 10 pairs of fringed lateral gills on the sides of as many abdominal segments. Several other genera and species are common in ponds.

The largest of the common water-beetles belong to the family *Hydrophilidæ*, which, however, also includes numerous small and inconspicuous species. In the form of the body and the fringed oar-like middle and hind legs they resemble the *Dytiscidæ*, from which all the members of this family are, however, at once distinguished by their short strongly-clubbed antennæ. The eggs are deposited in silken cocoons which are attached to water-plants or carried by the female. In general resembling the water-tigers in form, the larvæ have shorter, thicker, solid jaws, much less prominent respiratory tubes, and are much less active, although, like them, carnivorous. They pupate in burrows in the banks of the ponds which they inhabit. The great water-beetle (*Hydrophilus triangularis*) is a pitchy black polished beetle an inch and a half long, often seen flying at night, or during the day rising to the surface of clear weed-grown ponds for air and, unlike the *Dytiscidæ*, usually resting head upward. In adult life they forsake the predaceous habits and animal diet of their larvæ and become scavengers, finding their food chiefly in the vegetable debris at the bottom of ponds. Few inhabitants of fresh-water ponds and ditches are better suited to life in an aqua-

rium than these beetles and few present a greater variety or more interesting habits.

Consult standard works, especially Miall, 'The Natural History of Aquatic Insects' (New York 1895). See FRESH-WATER INSECTS.

Water-boa, the anaconda snake. See BOA.

Water-boatman. See BOAT-FLY; WATER-BUG.

Water Brush. See PYROSIS.

Water-bug, an aquatic bug of the hemipterous family *Notonectidæ*. The hind legs are long, and adapted for swimming by being provided with a fringe of stiff hairs. The body is prismatic in form, convex above and flat beneath, and the head is as large and as wide as the body. *Notonecta* is the typical genus of the family and *N. irrorata* and *undulata* are two of the common species. These and others abound in ponds and streams, where they rest on their backs at the surface, occasionally striking out with a vigorous oar-like movement of the hind legs, or dive to the bottom and cling to plants or stones. They are constantly buoyed up by a film of air which surrounds the abdomen, partly entangled in a coat of close fine hairs, partly held between the wings and the abdomen in a space into which the spiracles open, and partly between the joints of the abdominal and thoracic segments. On land the water boatmen are at a disadvantage and progress by a series of spasmodic leaps; but they are agile fliers. As larvæ, nymphs, and imagoes they are predaceous and, besides strictly aquatic insects, young fishes, etc., they attack and suck the juices of flying insects which happen to fall into the water or approach its margin to drink. Various other hemipterous insects, such as the water scorpions (q.v.), are aquatic.

Water-clock. See CLEPSYDRA.

Water Color Painting, in contradistinction to oil painting the use of water generally interfused with gum arabic as a vehicle for applying colors, very often transparently, to a white surface. Anciently, there were three distinct methods of water color painting, and these were known as tempera, encaustic and fresco. Tempera, or as it was sometimes called, Distemper painting, was common in early Italian art. (See PAINTING.) The colors were ground and mixed with the beaten-up white and yolk of an egg, or with the white juice of the fig tree, and sometimes with ox-gall. Encaustic painting (q.v.) was a process in which the colors were fixed by means of wax laid in a thin coating by the application of hot irons. The early Flemish and Dutch painters attained considerable success by the use of water colors in the shape of tempera, long previous to the invention of oil painting by the Van Eyck brothers. The Italian frescoes painted in water color, on damp plaster, have retained their colors scarcely impaired for centuries. (See FRESCO PAINTING.)

But when we speak of water color painting in a modern sense we refer rather to that which has been inaugurated since the discovery of oil painting and brought to great perfection by the modern schools of European painting. This style of water color painting has generally, almost universally, been executed on white paper. It is not too much to say that in England has been the first great field of water color painting. In the English school there has been

WATER COLOR PAINTING

no exclusive use made of what is known as body color. The lightness and darkness of each tint have generally been determined by the degree of their dilution with pure water, not by their modification through an admixture of Chinese white. Yet the old water color painters resorted to the pencil or the pen in finishing their drawings. They employed a great many varied kinds of paper; some of it was rough while sometimes it was perfectly smooth. In many cases tinted paper was used and the high lights picked out with Chinese white. In no case was a water color drawing begun before the paper had been stretched and sponged.

In early painting the pigments employed were generally mineral earths or juices pressed from plants. The colors found in antique frescoes were few but permanent in value. In the Middle Ages chemistry came to the aid of the fresco painter and supplied him with many brilliant and permanent tints, which in some instances vied with the lustre with which the church window maker annealed his glass. The modern water color painter has gained innumerable additions to the color gamut of his palette, and the freshness, crispness and unerring certainty of his touch have been largely due to the beauty, clearness and permanency of the colors in which he has worked. Manufacturers have, indeed, vied with each other in providing him with pigments which shall flow smoothly from his brush and stand projected with unclouded lustre upon his paper. While the modern water color painter aims at producing his effects by means of transparent washes in large and elaborate pictures, artists have not always considered it illegitimate to resort to the use of body color in their efforts to impart to their work the depth and solidity of oil painting.

The history of modern water color painting begins, as we have seen, in England, and the earliest precursor of the modern school was Francis Barlow (1626-1702). He painted birds and animals with appropriate landscapes, cleverly set in. In some ceilings which he decorated, birds were seen flying through the air; his drawing was spirited, but he was not a good colorist. Michael Angelo Rooker (1743-1801) was an early water color painter of landscapes and buildings and was principal scene painter at the Haymarket Theatre; he was a fine draughtsman and finished his work with such care and taste as give him a high place among early water color artists of England. This art was much advanced by Thomas Hearne, who used the pen much less freely than his predecessors, employing it with a delicacy which gave beauty of detail to the architecture and ruins which he generally chose as subjects of a pencil devoted entirely to water colors. William Payne (1760-1830) put this branch of art on a new footing, and first acquired that direct facility and dexterity of execution so requisite in the use of this vehicle; his works are also brilliant in color, and there is a breadth of treatment in sunlight effects, and in the contrast of warm tints and grays which established a precedent. John Robert Cozens (1752-1799) was the precursor of Girtin and Turner. His range of color was, indeed, narrow; he used Indian red, lake, indigo, yellow ochre, burnt sienna and black, yet Constable pronounced his works to be lovely, and he first taught the world

how atmosphere and sky can be rendered in a manner truly vivid and poetical, as the result of skilful handling. His pictures of Italian as well as of London scenery must be pronounced powerful. But, perhaps, Robert Girtin was the first to show the full power of this medium. He well-nigh entirely changed the practice of the art, and his pictures, which were made direct from nature, had a richness and depth of color, a clearness and transparency, which resulted from his method of first laying on in washes the fine local color of the objects before him, and then deepening the shadows with their own individual tints, as they shone before his eyes. His method was adopted by John Sell Cotman (1782-1842), whose landscapes and marines are some of the best productions of the Norwich School. Figure painting in water colors reached its first perfection in the works of Joshua Cristall (1767-1847), who was one of the foundation members of the Water Color Society. His early subjects were classical, but as he advanced in life he drew figures and scenes from country life, peasant girls, fishermen and landscapes, all executed in a direct, honest manner without the use of body-color or other doubtful expedient. More dramatic and sensational were the scenes of banditti, or of poetic romance, painted in water colors by Henry Liverseege—a worthy successor to Cristall in the simple and frank use of his vehicle, though his painting, in spite of powerful and brilliant coloring, was sometimes overstrained and coarse.

The full capacity of water color painting was not known before the pictures of Joseph Mallard William Turner (1775-1851), an early student of John Cozen's works, and a friend of Girtin, were exhibited to the world. His early water colors were, indeed, low in tone and gloomy, though forcible and convincing. What he came to do in the way of color is shown best in his Venetian studies, originally made on the spot in water colors. Turner, however, did not confine himself to the water wash; when he thought it necessary he employed body color in parts of his work, and even, on occasion, pastels; or it may be pencil or pen. But he never revealed to any one the secrets of a technique which made him the greatest landscape painter in water colors which the world has even seen. The foundation of the Old Water Color Society, in 1800, and of the New Society, in 1863, gave a great impulse to the art among whose representatives may be mentioned Fielding (d. 1855); Peter de Mint (d. 1849); Prout (d. 1852), the master of architectural painting; Cox (d. 1850), and the brilliant executor of oriental genre, Lewis (d. 1876). Taylor and Landseer, as animal painters, found this a successful and pliant medium, and among the Pre-Raphaelites who were eminent aquarellists may be mentioned Rossetti, Madox Brown, Burne-Jones, Holman Hunt and Millais.

In France, among able landscape painters in water colors, were conspicuous I. B. Isabey (1767-1855); Hubert, J. Ouvrié, Sué and Fort. They pretty generally employed body color (*gouache*) in their composition, the transparent wash being much less frequently employed in France. In portraits, Olivier Grand; in flower painting and still life, Redonté (1759-1840), the

WATER COLOR SOCIETY — WATER CRESS

best painter of this class France has ever produced. But the art was not tried to its full capacity until the oriental sketches of Eugene Delacroix (1798-1863) proved to the French art world that there was something to be sought for fresher and more inspiring than the frigid classicism of David. His lead was followed by Descamps (1803-60), one of the best colorists and most original painters of the modern French school, who taught his countrymen that it was possible to represent in water colors the broad blaze of open sunlight in an African sand-plain; or in the streets of Smyrna and Constantinople. The powerful genres of Gavarni (1804-66) made a sensation even in England, the native home of water colors.

The German school of water color painting began with the illuminating or tinting by hand of copper plate engravings. An independent and distinct department of aquarelle came late in the history of German art. The first notable aquarellists in that country were Karl Werner of Leipsic, and Edward Hildebrandt of Berlin — Viermann, Otto, Grael of Berlin, Heindrich, Stöckles, R. Stieles of Munich, and a circle in Düsseldorf, including Scheuren and Mintrop, kept up the old traditions of German water color painting. A new path was struck out by Menzel, who obtained a great following. He adopted a broad, frank and dashing style which was much admired. The Berlin painters, such as Franz Skarbina and Paul Mayerheim, vied with him in this method of handling. But German aquarelle has never been distinguished for the lightness of touch, the brilliant and transparent coloring, the powerful and vivid landscape effects which we find in the productions of English and French artists. Italy and Russia on the other hand have many skilful practisers of this art. The vivid coloring of such masters as Corelli, Zezzios, and Mainella has a light and lustre all its own and the creations of these painters are worthy of comparison with many of the most eminent workers in their own department of art in other parts of Europe. The same may be said of the Russians, Benken-dorf, Bergholz, Karafin, Heftler, Jegornow, Pissenski, and Ehrenon.

Water color painting has always formed a very living section of American art life. When Vassili Verestchagin, the great Russian war painter, was in America, he was astonished, according to his own account, that native artists were not more alive to the possibilities of American scenery and American life as subjects for the pencil. He was not sufficiently acquainted with the history of art in the country to which he had come a stranger, to be aware of the fact that local art had long flourished there. The Hudson River School of painters produced many noble transcripts from the scenery of that river, mostly in large canvases, and by employing oil as a favorite medium, but several of them have also executed gems of art in water colors after the style of the best masters. Among those who have done some good water color sketching among the sublime scenery of the West may be named Albert Bierstadt, some of whose views are correct in drawing and rich in coloring, albeit they owed their original impressiveness to the novelty of the effects in atmosphere and mountain contour or coloring which they reproduced.

The same in a less degree may be said of the drawings of F. E. Church. Neither of these painters was, however, as triumphant in water as in oil. The New York Water Color Club has done much to foster a revived interest in this most difficult yet most effective and delightful department of the painter's art, and among the most successful of those who cultivate it may be enumerated, Abbey, Moran, Parton, Murphy, Parsons, Shurtleef, Tryon, etc. Louis C. Tiffany is a colorist of rare gifts, and although his natural predilection leads him to the representation of still life, yet his water color landscapes have a value of their own. Charles Sanderson is well known for his lovely water color studies of the shores of Lake Michigan. At the end of the 19th century there was suddenly a new movement developed in this department, principally through the influence of John H. Twachtman, whose early death was a sad blow to the cause he had most at heart in his native country. In 1898 the Ten American Artists crystallized into a new school of painting in New York. As far as this movement was represented by Twachtman it stood for a distinct advance in water color art. There can be no doubt that he reflected in the practice of his art the very best features of that style which in Europe was embodied in the work of Girtin, Cozens, and Turner. Water color painting in the United States numbers among its devotees many other great names. Homer D. Martin's few water colors are of the highest value. Frederic Crowninshield shows in his water colors a noble sense of the form of hills and cliffs, and the greater forms of the landscape, as well as of tree-form. Winslow Homer's many water colors are about as important a contribution to American art as any other group of works. They are extremely vigorous and powerful, they sell at high prices, and among lovers of modern painting there are certainly none more esteemed. Winslow Homer is essentially a "painter's painter," and no single artist in the whole group is more admired by his fellow artists. John La Farge's water colors are what have chiefly made his great reputation. There are hundreds of them in private collections in Boston, New York, and neighboring towns, and the show of the South Sea Island collection, at the Paris Salon in 1898 or 1899, occupied a hall especially set aside for it, and made a great sensation. There is nothing in modern art more rich in color than these La Farge drawings, which have been produced during the years from 1865 to 1895, chiefly; for since that time he has been too much absorbed in decorating work, glass, and the like. The work of Robert F. Blum and that of Irving R. Wiles commands the admiration of their brother artists. Francis Hopkinson Smith is a master of loaded color, that which is mixed with white (the French *gouache*). There are women artists who excel in water color work of each kind.

Water-Gas, a mixture of gases produced by the action of steam on incandescent carbon. The carbon first decomposes the steam, forming hydrogen and carbon dioxide, and the latter gas then combines with more carbon to form the inflammable carbon monoxide. Thus water-gas is mainly a mixture of hydrogen and carbon monoxide. Pure water-gas is non-luminous, but it is rendered luminous by mixing with various gases obtained from petroleum, the luminous mixture being known as carburetted water-gas. Two chief methods are employed for the manufacture of water-gas for illuminating purposes. In the first of these, the Lowe process, the preparation of the pure gas and the carburetting are performed in one operation. The apparatus consists essentially of a generator, filled with anthracite or coke, in which the non-carburetted gas is produced; a carburetter, a circular chamber lined with firebrick and filled with a checker-work of the same material; and a superheater, a taller circular chamber similarly filled. By means of air-blasts and the producer-gas from the anthracite of the generator, the fire-bricks of the carburetter and the superheater are raised to a red heat, and then superheated steam is passed through the incandescent carbon. The water-gas formed passes over into the carburetter, where it becomes mixed with illuminant gases formed by the action of the heated bricks on mineral oil, which is introduced from above. This process is completed in the super heater, and the carburetted gas is then ready for purification. In the Wilkinson process the operations of making the gas and carburetting are separate. In the United States carburetted water-gas has largely replaced coal-gas as an illuminant, partly because of its brighter light and partly because it can be more cheaply manufactured in that country. Coal-gas is often mixed with carburetted water-gas in order to increase its illuminating power. The chief objection to the use of water-gas as an illuminant is the highly poisonous nature of one of its essential constituents, namely, carbon monoxide. Water-gas is also used in the non-carburetted condition as a fuel. See GAS.

Water Glass, a substance which, when solid, resembles glass, but is slowly soluble in boiling water, although it remains unaffected by ordinary atmospheric changes. It consists of soluble silicates of potash or soda, or a mixture of both. A substance of this kind was first discovered, so far as is known, by Van Helmont in 1640. In the 19th century Dr. Johann Fuchs of Munich did much to improve the mode of preparing and applying it. Water-glass may be prepared in two ways, called wet and dry. The former mode of preparation consists in breaking down and calcining flint nodules, the fragments or particles of which are then added to a solution of caustic potash or soda, whereupon the whole is exposed for a time to intense heat at 60 pounds pressure. According to the latter method the constituents are fused together in the solid state and afterward dissolved. The

product when prepared in this way is viscid, and may be used in this state or further diluted. In this method of manufacture the caustic soda or potash may be replaced by the carbonate or the sulphate. Potash water glass is more soluble than soda water glass, and if both metals be present a still more soluble glass, called double soluble glass, is obtained. Among the purposes to which water glass is applied are painting on glass, coating stone, wood, and other materials to render them waterproof, glazing scenery, and paintings, etc. It is also used mixed with sand to make an artificial stone, and it forms an ingredient in some kinds of cement. One of the most valuable of its applications is in the fixing of wall-paintings, which are more durable fixed by means of it than by the ordinary process of fresco-painting.

Water Hammer, the name applied to a vessel partly filled with water, exhausted of air and hermetically sealed. When reversed or shaken, the water, being unimpeded by air, strikes the sides with a sound like that of a metal striking against glass.

Water-hemlock, deadly poisonous plants (*Cicuta*) of the carrot family, known also by many other names, such as beaver-poison, spotted parsley, muskrat-weed and musquash-root, the latter names being borrowed from the muskrat, which inhabits such swamps as the *Cicuta* affects; and the odor of the roots of certain species of the latter also recalls the musk-scented rodent. *Cicuta maculata* is a tall biennial, reaching 8 feet in height, with a rigid, hollow stem marked with purple lines, that grows in swamps and wet lands throughout the northeastern United States. The leaves are decomposed, even three-pinnate, having coarsely serrate leaflets, with veins apparently ending in notches instead of at the points of the teeth, as in ordinary foliage. The flowers are very tiny and white, in decomposed, terminal umbrels, with unequal pedicels. The fruits are ovate-oblong, glabrous, and slightly flattened laterally. The ribs are corky, the lateral ones being strongest. Spindle-shaped, tuberous roots cluster about the base of the stem, and are the cause of many deaths. They have an aromatic flavor, and fleshy substance, and are frequently mistaken, especially by children, for the roots of sweet-cicely, parsnips, artichokes, or even horse-radish, and are sometimes eaten for no particular reason except that they are fleshy and exposed by washouts, freezing, or digging-operations. Even live stock are killed, not only by feeding on the tubers themselves, but by drinking water poisoned by roots which have been crushed under the cattle's hoofs. The poisonous element in this *Cicuta* is an aromatic oily fluid, which permeates the whole plant, but is found chiefly in the roots, and probably contains the alkaloid conine, and the bitter principle cicutoxin. When eaten *Cicuta* produces vomiting, colic, staggering and unconsciousness, and finally, frightful convulsions which end in death. No chemical antidote being known, the only treatment possible is to cleanse thoroughly the digestive system, and treat each stage of the attack, with such medicines as seem necessary. Cattle may sometimes be saved by timely and repeated doses of melted lard. The western water-hemlock (*Cicuta vagas*) has a fleshy root with a "vertical root-stock, from 1 to 6 inches long by 1 to 2 inches

WATER-HEN — WATER-LILY

thick, and is curiously divided into numerous chambers by horizontal partitions." The root is filled with tubes from which an aromatic oil exudes. Solid fleshy fibres are sent out from this rootstock, near the surface of the soil. Very small pieces of the rhizome are fatal to men or cattle, many of the latter being killed each year by it. The elongated, spindling-roots of the Wyoming water-hemlock, *Cicuta occidentalis*, which in Montana is known as the wild parsnip, has a characteristic musky odor, and stock are poisoned either by the young plants or by the roots. Other species of *Cicuta* have a similar appearance above ground and are equally poisonous.

Water-hen, or Moor-hen, a rail (*Gallinula chloropus*), generally distributed throughout Europe, Asia, and Africa. Its length is about 13 inches; back, wings, rump, and tail rich dark olive-brown; head, neck, breast, and sides dark slate gray; thighs and flanks streaked with white, belly and vent grayish white; beak yellowish, becoming red; naked patch on forehead red; legs and toes greenish-yellow, claws dark-brown. The female is rather larger and more vividly colored than the male. They frequent ponds covered with aquatic herbage, overgrown water-courses, and the banks of slow rivers, swimming and diving with facility, assisted by an expansion of the membrane along the sides of the toes. The water-hen is representative of the sub-family *Gallinulinae* of the rail family (*Rallidae*) which comprises 30 or 40 species found in all parts of the world. In the United States they are generally known as gallinules (q.v.) or mud-hens, and are represented by the purple gallinule (*Ionornis martinica*) and the Florida or common gallinule (*Gallinula galeata*).

Water-hickory. See HICKORY.

Water Inch, in hydraulics and irrigation, a measure of water equal to the quantity discharged in the 24 hours through a circular opening of one inch diameter leading from a reservoir under the least pressure, that is, when the water is only so high as to cover the orifice. This quantity is about 500 cubic feet.

Water-lily, a flower of the aquatic family *Nymphaeaceae*, especially of the genera *Castalia* and *Nymphaea*. These are found in fresh, still waters throughout the warm and temperate regions, and are often cultivated. Some can be easily raised from seed, and those which are hardy in the north, will stand a very low temperature without damage, even to be encased in ice. They may be grown in tanks, or even in half-barrels, as well as in ponds; but the tropical species, such as *Victoria regia*, require the warmth of a greenhouse, or heated tanks, in our northern latitudes. The water-lilies are handsome plants, having more or less orbicular, generally peltate leaves, either floating or, more rarely, immersed, and solitary flowers, of similar varying habit. These blossoms have several sepals and many petals, stamens, and carpels, the latter distinct, united, or immersed in a thickened receptacle; in color they may be white, pink, yellow, or blue, and are sometimes very fragrant. The fruit is indehiscent, somewhat fleshy, and like a giant berry filled with nuts, or, in the case of *Nelumbo*, the nuts are half sunk in pits in the flat-topped, enlarged

torus. The seeds are large with fleshy cotyledons and are naked, or enclosed in pulpy arils. Water-lilies, even in the time of Pliny, were considered to be an antidote to love-philtres. The most famous of them is perhaps the giant or royal lily, *Victoria regia* (q.v.). Another, which is very large, is the Australian water-lily (*Castalia* [*Nymphaea*] *gigantea*), which is one of the finest of its genus. Its flowers are sometimes a foot across, with hundreds of stamens, and the color is blue, or even other tints. They do not close so completely at night as do other water-lilies. The Egyptian lotus that was a favorite plant (*Castalia mystica*) of the ancient Egyptians is often confounded with the Indian lotus (*Nelumbo*), but is really a blue-flowered water-lily, formerly known as *Nymphaea lotus*. It was a valuable plant to the decorators of that country, who copied it, and conventionalized its form in many of their architectural ornaments, and also introduced it constantly into their painted pictures of life and customs. Its rootstock and seeds served as a food. (See *Lorus*.) The European water-lily (*Castalia alba*) is similar, but has white flowers that are apt to open a little above the surface of the water, being supported on a stiff petiole. The flowers are not fragrant, as are those of the American pond-lily (*Castalia odorata*). The latter lovely lily rides upon the water, with creamy-white petals radiating in circles, the inner gradually narrowing, and passing by various stages into golden stamens in the centre. They expand in sunshine and close in the early afternoon. The fruit is ovate and baccate, and ripens under water. The leaves, or lily-pads, a favorite food of deer, are ovate-orbicular, with a deep sinus, and have very long tubular stems of unvarying thickness, great flexibility, and toughness. The thick, fleshy creeping rootstock furnished a brown dye for the early settlers, and was also used as a styptic and tonic. A variety of this lily is smaller, and has rose-colored flowers. There are several other species of *Castalia* in the United States, including the handsome golden-flowered lily (*C. flava*) of Florida.

One of the most common water-lilies is the yellow pond-lily (*Nymphaea*, or *Nuphar advena*) which blooms all through the summer, but is not very beautiful. The leaves are ovate, or orbicular, with a deep sinus at the cordate base. They may be either floating, or erect, especially when the plant grows in tidal streams, and is likely to be left standing nearly out of water, upon the ebbing of the tide. These pond-lilies also are known as spatter-docks and frequently join with pickerel-weeds in obstructing a boat's passage to the shore, along which they stand in an extended ribbon. The flowers are flattened globes, made up of half a dozen thick, golden sepals, arching over the stamen-like sepals. The fruit is ovoid, somewhat constricted at the neck, and contains edible seeds. The strong-growing Pacific-coast representative of the spatter-dock is the *Nymphaea polyccephala*, known to the Klamath Indians as *wokas*. It is very like the eastern species. When fully mature, the large pods burst open irregularly at the base, and the entering water, when it reaches the white, mealy interior in which the seeds are imbedded, at once starts a mucilaginous dissolution of it, which frees the seeds, and allows them to sink into the water. These seeds were once a staple

WATER-LOCUST—WATER METERS

farinaceous food of the Klamath Indians, and are still a favorite delicacy among them. The squaws betake themselves in canoes to the lily-patches, and pluck the full-grown pods, while still hard, or scoop out those already dissolving with a wicker spoon. The latter are the more prized, and are deposited in holes in the ground, where the pods ferment, and turn into a mucilaginous mass from which the seeds may be freed by washing. Or the seeds may be extracted by other methods. They are then prepared in various ways for eating, either as mush or meal, or merely parched; they are delicious cooked in this manner.

Nelumbo nelumbo is the Indian lotus; *Nelumbo lutea* is the American or yellow lotus, of the Middle West. It is also called water-chinquapin, on account of its edible seeds.

Consult standard authorities, especially Bailey, 'Cyclopædia of Horticulture' (New York 1898).

Water-locust. See LOCUST TREE.

Water Mark. (1) The mark or limit of the rise of a flood or the mark indicating the rise and fall of the tide. (2) In paper-making, any distinguishing device or devices indelibly stamped in the substance of a sheet of paper while yet in a damp or pulpy condition. The water marks used by the earlier paper-makers have given names to several of the present standard sizes of paper, as pot, foolscap, crown, elephant, fan, post.

Water Meters, instruments by which the quantity of water or any other liquid flowing through pipes is measured and recorded automatically. They are of three general types—the "positive," the "inferential," and the "proportional" meters.

Positive meters measure the actual volume of the water, by the action of a piston working in a cylinder which is successively emptied and filled at the completion of each stroke. The cylinder being of known dimensions affords a measure of the quantity of water introduced in a given interval of time. The pistons are either reciprocating or rotary, or of the oscillating or gyrating disk patterns, and they may be single or double. When single, a weight or spring produces the return stroke, but in the case of the double arrangement, the reciprocal action of the two pistons is controlled by the action of each other, as in the case of a duplex pump. In rotary piston meters, which may also be of the single or double type, the pistons have interlocking faces and revolve in an air-tight chamber. Upon the outer surfaces of the pistons are a series of projections and recesses which correspond to similar shapes on the inner walls of the cylinder. The pressure of the flowing water causes the piston to revolve so that a series of recesses or chambers in the cylinder are successively filled and discharged from the inlet to the outlet of the meter. When oscillating or gyrating disks are employed in the place of pistons, the wobbling motion of the disks alternately empties and fills the cylinder. Inferential meters measure the velocity of the flowing water by recording the revolutions of a turbine or other water-wheel attachment, and the quantity is deduced by computation from that record. Proportional meters measure a fractional part of the full flow and are therefore capable of being set on a small by-pass pipe which

branches from and subsequently rejoins the main pipe, but their use is quite limited.

The registering mechanisms consist of a series of cog-wheels and dials. The flow of the water actuates the cog-wheels, and the number of revolutions are recorded on the dials. The arrangement of the mechanism converts the number of revolutions into any desired unit of volume, so that the reading of the dials is termed straight and gives the quantity direct, in cubic feet, the unit generally adopted, particularly in the United States.

The working parts of meters are made light and durable. Serviceability and accuracy are the qualities required, and in their design the support of the water pressure is employed to reduce to a minimum the loss of head, and the wear and tear of the working parts, and although a high degree of accuracy is not generally required, the meters are made sufficiently sensitive to measure the small flows incident to leakage. Hard rubber is generally used for the disks, and also for the rotary pistons of some meters, but where the liquids are hot, or consist of chemical solutions, brass is generally employed. Possible damage due to clogging by the introduction of fish or gravel, is prevented by various forms of strainers and sieves, while effect of frost is guarded against by frost cases.

There are several forms of meters which do not come under the general classes already described. Of these the "Venturi," constructed by Clemens Herschel of New York, in 1886, is the superior and most useful on account of its simplicity and durability. Its basic principles—the relation between the reduction of pressure and the increase of velocity of water flowing through a contracted pipe, was discovered by Venturi in 1796. In construction it consists of two conical shaped pipes with their smaller ends joined together by a collar or throat-piece, resulting in a shape similar to a pipe contracted at one point of its length. By gauging the pressure of the water at a point just before, and also directly at the point of contraction, and the relation of these pressures to the diameter of the pipe, the volume of the flow is computed. The tubes are usually constructed of cast iron or riveted steel, but they may also be constructed of masonry or wood. The length of the meter varies from 8 to 16 times the diameter of the uncontracted portion, while the diameter of the contraction ranges from one fourth to one half of the full diameter of the tube. They are made in sizes varying from 2 to 94½ inches, with practically no limit to the possible maximum size, but for practical use where meters of diameters less than six inches are required those with moving parts are cheaper. Waste-water meters are employed in connection with water works to measure the rate of consumption per unit of time, instead of the total volume. They consist usually of a disk placed horizontally in a cone-shaped chamber. The disk is lifted or lowered according to the greater or lesser volume of water passing through the pipe in which it is set, and being connected by a wire with a counter weight and pencil which follow the movements of the disk, records the nature and amount of those movements on a paper carried by a drum which is revolved by clockwork. The vertical rulings of the record sheet indicate the time intervals, while the horizontal lines

WATER-MOCCASIN—WATER MOTOR

represent the units of volume. Since all the water consumed in a given district must pass through such a meter, by comparing the rates of consumption of the various districts, the causes of abnormal waste are readily determined and localized.

Another form of water meters, more particularly known as current meters, are employed in hydraulic engineering to measure the velocity and volume of flow of the waters in rivers, large aqueducts, and sewers. See **CURRENT METERS**.

Water-moccasin, a snake. See **MOCCASIN**.

Water Motor. In its broadest sense the term is applicable to all forms of machines or systems of machinery operated by water under the force of gravity, or in other words, by which the energy inherent in a natural waterfall is utilized to perform mechanical work. Of these machines, the water-wheel (q.v.), the turbine (q.v.) and the pump (q.v.), have been treated under their respective titles, but in this article the term will be considered as designating those machines which are operated by the element of pressure only, such as hydraulic lifts and water-pressure engines.

The Hydraulic Lift is the simplest of all water motors. The direct-acting lift consists of a cylinder in which a ram or piston of equal length, with a cage attached to its upper end, works up and down. The level of the water supply is necessarily above that of the maximum height to which the cage may be lifted, so that when the water is admitted to the cylinder through its lower end, the pressure forces the ram upward and thus lifts the cage. The descent of the ram is accomplished by closing the supply valve and opening the discharge valve, the ram descending by its own weight. As the weight of the ram is greater than necessary to bring down the cage, a part of that weight is balanced by a weight attached to the end of a chain that works over a pulley at the top of the lift and is connected to the cage. The most familiar examples are the high-speed hydraulic passenger elevators. They are operated by the pressure of water pumped into tanks situated on the roofs of the buildings in which they are installed, while the operating machinery is located in the basement. (See **ELEVATOR**.) The hydraulic press and the hydraulic ram are devices operated practically under similar principles. In the former, the action depends upon the principle of hydrostatics that a pressure applied to any part of the surface of a liquid is transmitted in all directions, and throughout the mass without diminution. For example, if a cylinder filled with water has a plunger one inch square working through one end, and another ten inches square working through the other end, and a pressure of one pound is exerted on the smaller plunger, this pressure will be transmitted to the larger plunger, and be delivered by the latter in a multiplied amount equal to the square of its face area expressed in pounds. In this example that pressure would be 100 pounds. Such presses consist essentially of two cylinders connected by piping. The pressure is applied to the plunger of the smaller cylinder, and the multiplied pressure is transmitted by that of the larger to the

object to be raised or pressed. In construction they vary greatly with the purposes for which they are employed. Those used as hay, cotton and oil presses, consist of four strong iron pillars arranged in the form of a square, which carry a cast-iron plate solidly attached to their tops. A similar casting is situated at the bottom of the pillars. Through a circular hole in the centre of the lower plate, a plunger carrying a square platen on its head, works with an upward motion and presses the material placed between the platen and the under face of the top plate. In presses used for hydraulic forging, the cylinder and plunger are carried by the top plate, while the bottom plate carries the anvil. The plungers work downward in the act of pressing or hammering. They are made of various sizes, and are generally provided with two pressure plungers and cylinders, and they are adapted for purposes varying from the manufacture of revolver cartridge cases to the forging of armor plate, guns, and steamship shafts. Armor plate, presses capable of exerting a pressure of 14,000 tons are in use, while 7,000-ton fluid compressors are employed in many of the larger steel manufacturing plants. A brief description of the construction and working of one of the last-named capacity will serve to illustrate the mammoth proportions and enormous power of these machines. It consists of an upper head weighing 120 tons carrying the plunger, and a 135-ton base plate containing the hydraulic cylinder. These are supported and held in place by four vertical connecting columns each 50 feet long, and 19 inches in diameter. In operation, the molten metal is poured into a mold built up in sections, and the mold is raised under a hydraulic pressure of 7,000 tons, while a plunger attached to the upper head bears down upon the fluid metal and compresses it.

Hydraulic Ram.—In the hydraulic ram the force of water flowing by gravity is utilized to raise a portion of itself to a height above that of the source of supply. Two pipes are employed. The water in flowing through the main or drive pipe acquires sufficient momentum to close a valve at the foot of the pipe, and the water thus confined automatically opens another valve, partially fills an air chamber situated over the foot of the main pipe, and compresses the air in it until the pressure within balances the column of water in the main pipe. Then, the foot valve of the main pipe opens again and the action described is repeated. In the meantime, the pressure in the air chamber forces the water through a small service pipe leading out of its bottom, to the required height. See **HYDROSTATIC PRESS, HYDRAULIC RAM, AND PUMPS AND PUMPING MACHINERY**.

Hydraulic Engines.—In the hydraulic lifts or elevators, the admission and discharge valves are worked by hand at the will of the operator, but in the engines the mechanism actuates the valves automatically and periodically, thus converting the lift into a machine with a continuous action. Unlike the vertical water wheels and turbines, the efficiency of which depends upon the weight of a large body of water falling from a comparatively small height, the water engines work under the pressure of a small column of water descending from a considerable elevation. They are of three types—the "single action," in which a piston working in a cylinder is moved upward by the pressure of the water,

WATER-MOLDS—WATER-POWER

and downward by the weight of the piston itself; the "double action," in which the cylinder is closed at the top as well as at the bottom, and the water admitted to it by supply pipes at those points, acts reciprocally on the piston from above and below; and the "rotary," in which the water pressure acts on a revolving piston similar to that of a rotary steam-engine. Rotary engines may be of the single-acting or double-acting type, the advantage being with the former, since the pressure of the piston is always exerted on the crank pin in one direction, and the dead centres are passed without knocking. Generally three single-acting cylinders formed in one casting are used in connection with a disk valve with segmental posts which pass over corresponding apertures in the valve seating during rotation, and the engine will readily start in all positions. The first engine of this kind was constructed by Sir William Armstrong, who also subsequently designed one of the reciprocating pattern. Since then a great variety of hydraulic engines have been invented, the greater number of them being of the last-named type. They have a wide field of usefulness, especially as auxiliary motors for driving small machinery such as hoists, swing-bridges, capstans, cranes, winches, etc. The employment of superheated water motors is one of the latest developments in the methods for railroad traction. In the earlier forms of engines operated by superheated water, the storage tank being charged with water at a temperature corresponding to several hundred pounds of pressure, the steam from the water was utilized in the cylinders of the motor in a manner similar to the utilization of steam from the boiler of a locomotive engine by expansion in its cylinders. Their operation was based upon the relation of temperature and pressure to the vaporization of liquids, and the steam was drawn off from its point of formation at the top of the storage tank to the cylinders. Under these conditions, new steam was supplied by water which boiled at lower and lower pressures and reduced temperatures, until the pressure fell to a point at which it was not available for use in the motor, and only about one ninth of the energy of the heated water was actually used in the cylinders. About 1888, W. E. Prall of Washington, D. C., suggested the utilization of the heat in the storage tank by withdrawing it in the form of water from the bottom of the tank instead of steam from the top, and allowing the water thus withdrawn to give up its heat within the cylinders of the engine itself. In the latest motors, this is accomplished by a generator composed of a nest of tubes coupled into manifolds at the top and bottom. The working pressure is about 700 pounds to the square inch, and the water is drawn off from the generator into three insulated storage tanks with a total capacity of 7,000 pounds, carried beneath the car. From the bottom of the tanks the water is delivered through three Tappet valves provided with screw and nut adjustment, to regulate the amount of feed. In operation, under the decreasing pressure caused by the movement of the piston through its stroke, the water resolves into steam in a continual series of flashes, while the steam and the unevaporated portion of the water from the high-pressure cylinders, pass out through the ports in its bottom, and is drained off through valves located in the lower face of

the valve chest. The exhaust steam from the high-pressure cylinder passes in the ordinary way to the low-pressure cylinder, from which it is finally exhausted, into the atmosphere. It is estimated, that a car equipped with two compound engines and three tanks charged with water at a pressure of 700 pounds to the square inch, and a corresponding temperature of 500°, will be capable of running 40 miles at a speed of from 30 to 40 miles an hour.

Water-ouzel. See OUZEL.

Water-plane. See WATERS, UNDERGROUND.

Water-plantain, an aquatic or marsh herb of the genus *Alisma*, family *Alismaceae*, of which *Sagittaria* (q.v.) is also a member. The plant most commonly known as water-plantain is that found also in Europe and Asia (*Alisma plantago aquatica*), which grows in mud or shallow water. It has a circle of radical long-petioled leaves, ribbed ovate, and strongly resembling those of the common plantain. The scape, which is usually solitary, branches verticillately, and forms a large, open pyramidal, flowering panicle; the blossoms are very small, white or rose-colored, and have their parts in threes.

Water-power, a term used popularly and by engineers to define the apparent inherent energy of a falling body of water. It more properly signifies the application of the force of gravity employed as a motive energy for industrial purposes through the medium of water. Next to wind-power, when available in a sufficient amount, it is the ideal form of motive energy, combining a constant supply with a minimum of cost. Water acts as a motive power either by its weight, or by its *vis viva*; in the latter case the action is either one of pressure or impact, and the energy thus exerted is made available for industrial purposes by three classes of machines—water wheels, turbines, and hydraulic pressure engines. See WATER WHEELS; TURBINES; WATER MOTORS.

When the power is derived from a fall, and utilized by means of water wheels, the potential energy is the product of the height through which the water falls into the weight of that water, and may be readily computed for any fall by multiplying the volume of the flow in cubic feet per minute by 62.5 (weight of 1 cubic foot of water in pounds), and this product by the vertical height in feet. The result will be the amount of power expressed in pounds, which when divided by 33,000 will give the horse-power. When a stream acts with an impinging force upon a solid surface, the pressure exerted is equal and opposite to that by which the velocity and direction of the stream is diverted. Neglecting the factor of friction between the fluid and the surface on which it moves, the effect of the machine is equal to v^2 — wX , in which X represents the volume in cubic feet, w, the weight of water in pounds, g, grav-

WATER-POWER

ity, and v , the velocity of the flow in feet per second. When the action is that of weight and *vis viva* combined, as in the case of water flowing in a tube, the horse-power or the mechanical

effect of the motor is equal to $(h + \frac{v^2}{2g}) \times \text{mul-}$
 tiplied by 62.5.

As a basis for indemnity under confiscation and other adjudication proceedings, the value of a water-power is commonly estimated as represented by a sum of money, the interest on which would maintain a steam plant at that place, capable of producing an equal amount of power. The best authorities, however, consider the method as erroneous, and that the value of such a power really depends upon a great number of conditions, such as location, quantity of water, height of falls, uniformity of flow, expense of dams, canals and foundations, the character of the machinery installed, and the freight charges for fuel, raw materials and finished product. Making the proper allowances for these conditions, a comparative estimate on the basis of a 500 horse-power plant, gives the gross cost of a horse-power per steam plant as about \$22,000, and that of a water-power plant as about \$19.00, representing a saving of \$30,000 per 10,000 horse-power per annum by the use of the latter. Another estimate based upon the cost of steam on large compound engines generating 1,000 or more horse-power under a boiler pressure of 120 pounds, gives a cost per annum of \$20.00 per horse-power, against \$15.00 per horse-power, developed by a water-power electric plant, established at an original cost of \$100 per horse-power, and allowing for the wages of competent attendants for the dynamos.

For renting purposes a rate unit termed "mill-power" is employed. This unit, however, is quite arbitrary, and varies in different locations, even in the same States. At Holyoke, Mass., it is declared right to draw 38 cubic feet of water per second during 16 hours in a day where the head at the fall is 20 feet, or a quantity proportionate to the height at the falls, equal to 86 horse-power, as a maximum, while at Lawrence, Mass., it is right to draw during 16 hours in a day a quantity of water sufficient to give a power equal to that of 30 cubic feet per second with a head of 25 feet, equal to a maximum of 85 horse-power.

The natural sources of water-power are rivers and streams, but as the gradient or fall of a river is seldom more than sufficient to overcome the friction due to the gradual descent of its waters, the kinetic energy or energy of motion is made available for practical purposes by the employment of dams, canals and aqueducts. The use of dams may be illustrated by assuming the gradient of a stream to be 2 feet to 100 feet. By building a dam 12 feet high across the stream, the gradual slope of 12 feet over a distance of 600 feet is converted into a vertical interval of 12 feet, and the kinetic energy of the stream expended in friction over the gradual descent of 600 feet is accumulated at the top of the dam in the form of head or pressure. This energy is utilized by conducting the water flowing over the dam to the motors through which it passes into the tail race and re-joins the stream. Where conditions are unfavorable for the construction of a dam a part of the stream may be directed into a reservoir

at a point beyond that at which the power is required, sufficiently distant to give the necessary fall, and then conducted by a canal or aqueduct to the motor, as in the case where the power is obtained from a natural water-fall. Occasionally, where the velocity of a stream is sufficient to give the required power, it is used directly for working the motor.

Current motors, however, to be most effective, would require the backing up of the whole volume of a stream until the actual head was equivalent to the theoretical head developed by the natural velocity of the stream, and as but a fraction of this velocity can be taken up by such a motor, its efficiency is generally very small. They may be employed to obtain power in small amounts from large streams, but are impracticable for developing large powers.

From 1822 up to the present time (1904) over 35 water-power plants of great magnitude have been established in the United States, capable of developing in the aggregate over 300,000 horse-power per minute. The individual plants developing 10,000 horse-power, or more per minute, are those at Lowell, Mass., 11,845, with a head of 35 feet; Manchester, N. H., 12,000, head 54 feet; Lawrence, Mass., 11,000, head 30 feet; Holyoke, Mass., 14,000, head 50 feet; Lewiston, Maine, 11,900, head 55 feet; Columbus, Ga., 10,000, head 26 feet; Saint Anthony's Falls, Minn., 15,500, head 50 feet; Niagara, N. Y. (Hy. Canal), established in 1861, 15,000, head 95 feet; and tunnel, established in 1894, 50,000, head 176 feet; Turner Falls, Conn., 10,000, head 35 feet; Spokane, Wash., 18,000, head 72 feet; Great Falls, Mont., 16,000, head 40 feet; Austin, Tex., 10,000, head 68 feet; Sault Ste. Marie, Ont., 10,000, head 15 feet; and Helena, Mont., 10,000, head 38 feet.

At Niagara, Sault Ste. Marie, Ogden, Mechanicsville, and Great Falls the water-power is employed to operate turbines or water-wheels which in turn drive electric dynamos, and the electrical energy thus developed is transmitted to and utilized by the neighboring cities. The power that may be thus obtained from the falls at Niagara is practically unlimited, and after the turbines are installed entails no further expense; but the enormous cost of the conductors required to transmit the electric power to distant points prevents the establishment of additional plants to develop a greater voltage for that purpose, while that produced at the present time is actually much more than the cities in the immediate vicinity are capable of utilizing, under the existing low voltage regulations. As a matter of fact, although the possibility of transforming water-power into electrical energy which was capable of being transmitted to comparatively distant points was a great impetus to the development of water-power plants of great magnitude, a fair, not to say full, utilization of the almost incalculable amount of power going to waste at Niagara and elsewhere, is possible only through the discovery of a cheaper conductor of electricity than copper.

WATER PURIFICATION — WATER SOFTENING

Water Purification. See WATER SUPPLY; WATER-WORKS.

Water-rabbit, or Swamp-hare. See HARE.

Water-rail, a species of rail (*Rallus aquaticus*) widely distributed over Europe, Asia, and North Africa, and generally common, but, on account of its retiring habits and shyness, not often seen. It is about 11 inches long, olive brown above streaked with black, the under parts gray and the sides streaked. It frequents marshes and bogs, dives and swims well, but is a poor flyer. It is a delicious table-bird. In North America its nearest representative is the king rail (*R. elegans*). The name is applied generally to other species of aquatic rails (q.v.) in distinction from the land-rails and crakes (q.v.).

Water Rat, or Vole. See VOLE.

Water Rights. See RIVERS; RIPARIAN RIGHTS.

Water-scorpion, a bug of the family *Nepidae*, whose species inhabit ponds, and take their popular name from the scorpion-like form of the fore-legs, with which they seize their prey. The remaining two pairs are slender and locomotory, and the abdomen terminates in a long, slender breathing tube. Some of the species carry the eggs in a layer on the under side of the abdomen. *Belostoma* includes the largest species with flattened bodies and four-jointed antennæ; *Nepa* is much flattened and oval, and the antennæ are three-jointed and lamellate; while *Renatra* includes species of linear form. The larvæ and nymphs of the water-scorpions resemble the imagoes in general aspect, but lack the wings of the latter. In all stages they are sluggish in movements and secure their prey by hiding and stealth. These insects are very interesting in habits and structure. See FRESH-WATER INSECTS.

Water Shell. See ORDNANCE.

Water-snake, a harmless colubrine American snake (*Natrix fasciata*), closely allied to the garter-snakes (q.v.), but of aquatic habits, swimming and diving with great ease and skill, and spending its life largely in streams, ponds, and marshes. It lives largely upon fish, either alive or dead, frogs, tadpoles, newts, and aquatic insects and other small creatures. It is mottled in variable dull tints, and lively and pugnacious. Its eggs are laid in holes in stream banks and similar places. The common grass-snake (q.v.) of Europe, the only British serpent except the viper, is a near relative.

Water Softening, specifically the art of extracting from water the calcium (lime) and magnesium compounds which combine with soap and prevent the formation of lather, and thus are said to make the water hard; in general the extraction from water of any substance, lime, magnesia, acid, mud or other material which renders the water unsuitable for industrial use. Rain water contains only the soluble gases of the air, carbonic acid gas and oxygen, and such dust and dirt as it may have washed out of the air in its fall. Such water mixes readily with soap to form a slippery lather, and the water is said to be soft. If rain water runs down a clean, grassy slope to a stream, it is still nearly pure soft water. If it runs over limestone, or ground containing particles of limestone, it dissolves a

small amount, perhaps two grains per gallon or one part of limestone to 30,000 parts of water; but for practical purposes this is still called soft water. If, however, the rain water sinks into the ground to remain a long time in contact with limestone, it dissolves greater amounts, frequently 20 grains per gallon of water and sometimes more than 100 grains per gallon; and water is commonly said to be hard if it contains more than 5 grains per gallon. Deep well waters are nearly always of this nature. In the arid plains of the western part of the United States where the soil contains large quantities of common salt (chloride of sodium) and the other salts of sodium and potassium which are all readily soluble in water, the well waters are usually heavily charged not only with the salts of calcium and magnesium but also with the salts of sodium and potassium, and such water is called alkali water. The water which is found near the coal fields frequently contains sulphuric acid to the amount of 2 or 3 grains per gallon. Lakes contain the waters of many creeks and rivers and are usually soft water; but the current is slow and there is some concentration due to evaporation of the water, so that lake water contains rather more mineral matter than river water and is on the border line between soft and hard. Lake Erie water contains about 5 grains per gallon of the salts of calcium and magnesium. The oceans are the final receptacles for the waters of the rivers and lakes and are subject to continuous evaporation, so that in the course of years the mineral matter has become concentrated and ocean water contains about 2,100 grains per gallon of mineral matter, made up of calcium carbonate, 8 grains; calcium sulphate, 75 grains; magnesium sulphate, 99 grains; magnesium chloride, 230 grains; potassium sulphate, 55 grains; sodium chloride, 1,633 grains; the great amount of sodium chloride and the relative scarcity of calcium and magnesium compounds being due to reactions which have taken place in the water. Great Salt Lake in Utah and the Dead Sea in Palestine (q.v.) are small bodies of water, like oceans, without other known outlets than evaporation, and since the rivers feeding them are heavily charged with common salt, these lakes contain much more of it in proportion than the oceans. Ocean water contains about 3.5 per cent mineral matter, the Dead Sea 26 per cent, and Great Salt Lake averages about 20 per cent.

When hard waters are evaporated the mineral matter is left in a solid mass, interesting examples being found in the stalactites and stalagmites in caves, in the incrustation about the teeth in the human mouth, and in the deposit in the bottoms of tea kettles. The most serious damage produced by hard water in industrial operations is from the scale deposited in steam boilers and from the waste of soap in washing. Scale in boilers prevents the easy passage of heat from the fire to the water, and shortens the life of the boiler because of the excessive temperature to which the steel must be raised in order to force the heat through the scale to the water. The amount of extra fuel required to evaporate water in a boiler which is coated with scale varies with the thickness and character of the scale and with the rate at which the boiler is worked. When the boiler is being driven to nearly its full capacity, the amount of extra fuel required by a $\frac{1}{4}$ inch

WATER SUPPLY

River Companies. London, Rotterdam, Hamburg, Bremen, Berlin, Saint Petersburg, Warsaw, abroad; Albany, Philadelphia, Washington, Cincinnati, Saint Louis, Nashville, Pittsburg, and Louisville, in the United States, are among the large cities depending upon rivers as their sources of supply. Glasgow, Liverpool, Manchester, and Zürich, abroad; and Buffalo, Cleveland, Chicago and Milwaukee of the large cities in the United States, have their sources of water supply in lakes. The lake which supplies water to Liverpool is a large artificial reservoir created in the Vyrnwy Valley in the north of Wales, distant about sixty-five miles from the city, from which the water is drawn first to filters at elevation sufficient to supply the filtered water by gravity to the city. Glasgow draws its water from Loch Katrine; Manchester from Lake Thirlmere; Zurich from the lake of that name, or from the River Limmat, the outlet of the lake, a short distance from its mouth; the American cities mentioned take their source in the system of Great Lakes. One of the most notable instances of large volumes of water from deep rock wells is in the supply to the city of Indianapolis, which obtains its water from twenty-five wells drilled into the water-bearing limestone which abounds in that section of the country. Of the twenty-five wells, twenty are 10 inches in diameter, and penetrate the drift and rock, distances ranging from 300 to 320 feet, with an average depth of 308 feet, and five are 8 inches diameter, with an average depth of 295 feet. The average thickness of the drift in the locality of the wells is about eighty feet. The gauged daily capacity of the twenty-five wells September 1898 was 18,700,000 gallons. In 1896 the yield of the system of driven wells which supplied water to Brooklyn was about 32,000,000 gallons. The principal cities abroad drawing their water from ground sources are Schalke, Dortmund, Cologne, Dresden, Bochum, Leipsic, Stockholm, and Copenhagen, with daily yields ranging from 6,000,000 to 11,430,000 gallons. The Vanne water, which is used for dietetic purposes in Paris, is obtained from springs, and to preserve it without change of quality it is conducted to the city in a closed conduit, received in distributing reservoirs, from which the light is carefully excluded, and reaches the consumer quite as pure as it was upon issuing from its mountain source. Cities have been located not according to the rules of hygiene, but according to the requirements of commerce; revenue rather than health has been the dominating factor, and upon the sanitarian has fallen the burden of rectifying the evils which have followed the total disregard in so many cases of one of the fundamental laws of health.

The various methods of supplying water to cities are embraced in the following systems: (1st) by gravity from natural lakes or impounding reservoirs at elevation sufficient to furnish domestic and frequently fire pressure; works typical of this system are found in New York, Boston, Baltimore, San Francisco, and Saint Paul; (2d) by pumping from rivers or lakes, or other sources, to reservoirs placed at elevation sufficient to supply under pressure water for domestic purposes, and often for fire protection; works typical of this system are found in the older works of Philadelphia, Pittsburg, Cleveland, Cincinnati, Saint Louis, Louisville,

Omaha, and Kansas City; (3d) by pumping from the sources mentioned under the second system to stand pipes, which fix the head upon the pumps and the distribution system, and supplying direct into the distribution mains; works typical of this system are found in Chicago, Milwaukee and Detroit; (4th) by pumping into the distribution mains without the intervention of stand pipes; works typical of this system are found in Indianapolis, Dayton, and Columbus.

Where impounding reservoirs are used at elevation sufficient to furnish a satisfactory pressure, these are invariably built with a view to carrying a volume of water which without the addition from rainfall would be sufficient to supply a city for at least six months, and naturally these basins become large sedimentation reservoirs, and the water as a rule is very satisfactory for drinking and other domestic uses. In the older works, where the water is pumped from rivers or lakes to storage and settling basins, the latter have been planned to contain several days' supply, and allow for a subsidence of the suspended matter in the water while retained in, or while passing through such basins. Where water is pumped under stand pipes, of course, no subsidence takes place, and the water is delivered to the consumer in substantially the same condition as it was taken from the source of supply. The same condition holds good for direct service works in which neither reservoirs nor stand pipes are used. Many of the smaller water-works built during the past twenty years have been carried out after the fourth system because it represents the least first cost, although less economical in operation than works which provide for pumping to reservoirs, or works pumping under stand pipes.

In the early history of impounding reservoir gravity works, and works in which the water was pumped to large reservoirs, it was thought a limited subsidence of a polluted river or lake water in such reservoirs would overcome all natural objections to the quality of the supply. It is now known that no surface water, whether gathered in streams or lakes, is fit for domestic uses excepting it be subjected to some method of purification which will eliminate the suspended matters due to sewage, and the washing of detritus from the water-sheds upon which the water is gathered. If it were possible to construct subsiding reservoirs of such capacity that the water might be retained for many days or weeks after being pumped from its source in order to secure a high percentage of subsidence of the suspended matters, this would remedy in part the objection to such water supplies taken from sources known to receive the effluents from city sewers, but the length of time required to successfully purify water in this manner is too great to admit of serious consideration of such a method of water purification for most cities, and filtration is resorted to as a means of doing in a short time what could be accomplished only in a very long time by means of sedimentation basins. Experiments with the water of the Ohio River at Cincinnati several years ago indicated that thirty days quiescent subsidence in reservoirs would reduce the bacterial content and turbidity about 97 per cent; filtration will rapidly reduce the bacterial content of polluted river and lake waters by 99 ± per cent, and almost entirely eliminate the turbidity. The reports of the performance of the filters at

WATER SUPPLY

Upper Roxborough (Philadelphia), where the water is carried for a short time in subsiding basins before it is thrown on the filters, show the remarkable change which can be made in a few hours by means of plain sand filters, and it is scarcely likely that in the future construction of works of public water supply many instances will be found where settling basins are planned to furnish more than two days' subsidence of the water before it passes to the filters for purification. The objection to any sewage polluted water is founded entirely upon the matters carried in mechanical suspension. The waters of large lakes or rivers probably never contain dissolved matters which unfit them for drinking and other domestic uses, nevertheless, few of these sources contain water which in its natural condition is fitted for drinking and other domestic requirements, and any system of purification which will remove all the suspended matter will be found capable of rendering the waters of large lakes and rivers well adapted for domestic purposes. The sole purpose of water purification is therefore to remove matters in suspension, of which the bacteria are a part, and as this can be accomplished much quicker, cheaper and better by plain sand filters than by large subsiding reservoirs, it is fair to presume that the latter will find few places in the future history of water-works engineering, excepting of course in such instances where the topography naturally suggests a gravity supply from impounding reservoirs of large capacity placed at an elevation sufficient to furnish the desired pressure in the street mains.

Consumption of Water.—One of the two most important problems in connection with public water supply at the present time is how to restrict the large and growing per capita consumption. Meters on the service pipes of consumers are thought by many to be the remedy, but while no one objects to the metering of the gas which he consumes, few outside of a small circle of water-works students favor the metering of water, the fear naturally being that with the advent of water meters the water bill will increase in size, or that the quantity of water allowed per consumer may be uncomfortably restricted. It does not follow that the use of water meters will generally increase the consumers' water bills, nor will the meter in any way limit the use of water, but a large consumption will require the payment of higher charges than for a small consumption.

Some idea of the per capita consumption of water in the larger cities of the United States can be gained from the following table:

CITIES 1900	Populat'n supplied	Daily gallons	Per capita gallons
New York.....	2,049,000	245,700,000	120
Chicago.....	1,698,000	323,000,000	190
Philadelphia.....	1,294,000	287,188,000	229
Brooklyn.....	1,110,000	95,900,000	86
Boston.....	560,000	80,000,000	143
Cleveland.....	420,000	66,000,000	159
St. Louis.....	400,000	63,539,000	159
San Francisco.....	342,800	25,000,000	73
Cincinnati.....	325,900	39,600,000	121
Detroit.....	306,055	44,800,000	146
Milwaukee.....	300,000	24,000,000	80
New Orleans.....	287,104	13,820,000	48
Minneapolis.....	202,718	18,813,000	93
Providence.....	187,300	10,130,000	54
Indianapolis.....	169,164	13,400,000	79

Investigations in New York, 1900, by the Merchants' Association, showed meter measurements of water per capita per diem as follows: Of 25 houses where daily records for two weeks were taken in January, 18 used water at the rate of 51 gallons per capita, and 7 houses used water at the rate of 165.75 gallons per capita, or an average per capita consumption for the 25 houses of 91.36 gallons. At the same time, of 12 premises in Brooklyn 10 used water at the rate of 47 gallons per capita, and 2 used water at the rate of 121.45 gallons per capita, or an average for all consumers of 59.4 gallons per capita per diem. This consumption excludes the loss in the joints of street mains, but includes the loss from leaking fixtures. Mr. Croess estimated the per capita consumption as 116 gallons per day, which he thought by metering all domestic services could be reduced to 65,000,000 gallons per day.

The wide variation of consumption in different cities cannot always be easily accounted for. Thus in Denver the large per capita consumption can be attributed partly to the necessity of taking water from the street mains for all purposes, including irrigation of lawns, trees and shrubbery, and partly to the lack of necessity at the present time for an economical use of water, but why Cleveland, a manufacturing city, should use or waste water at three times the rate of Providence, another manufacturing city, cannot so easily be explained, excepting that in the latter city nearly all service pipes are metered, while few meters are used in the former. No individual consumer is ever ready to admit that he wastes water, and doubtless fancies that considering his actual needs, he is very careful to draw no more than the quantity required by his bare necessities. Nevertheless, aside from the leakage at the joints of street mains, which ought not to vary widely in different cities, equipped with modern cast iron pipes, there is a difference in the per capita consumption which can only be accounted for by differences in the habits of the consumers.

Mr. Dexter Brackett, in a paper to the American Society of Civil Engineers, 1895, from investigations in and around Boston, showed that the per capita consumption ranged from 6.6 gallons in small domiciles with a single faucet to 46 gallons in first class apartment houses. From the same source the interesting fact is obtained that for 12 of the larger cities of the United States, the consumption of water per capita has rapidly risen during the twenty years prior to 1894, thus:

CONSUMPTION — GALLONS, PER CAPITA, PER DIEM.

WATER SUPPLY

In considering the consumption of water per capita per diem, some thought should be given to the unavoidable losses by leakage of reservoirs, pipe distribution systems, service pipes, and domestic plumbing. It is customary to charge the whole pumpage, or draft from impounding reservoirs or other gravity sources to consumption, while as a matter of fact, with few exceptions, about one half the so-called consumption is lost through leakage of reservoirs, pipe systems, and plumbing fixtures, and of the remaining one half, supposed to be used, some waste might also be recorded. The information with reference to leakage of reservoirs is rather meagre, but it is well known that no reservoir is entirely watertight, and so long as the loss is not calculated to imperil the stability of dams, embankments, and like structures, nor create a costly or unallowable deficiency in the water supply, but little attention is paid to such losses.

Some data on the daily and percentage loss of water in concrete tanks, backed by well prepared clay puddle, from the new Philadelphia water-works (1903) is given in the following table:

LEAKAGE OF BELMONT FILTER TANKS.

Area (one filter) 31,800 square feet, depth of water 9 feet. Percentage leakage based on a daily flow of 4,380,000 gallons of water through each filter tank.

FILTER *	Leakage in 24 hours	Percentage loss

* Filters tested to date.

LEAKAGE OF LOWER ROXBOROUGH FILTERS.

Area (one filter) 23,087 square feet, depth of water 9 feet.

Percentage loss of filters based on a daily flow of 3,180,000 gallons of water through each filter, and of 12,000,000 gallons per day through the clear water basin:

FILTER	Leakage in 24 hours	Percentage loss
1.....	885	0.0278
2.....	3,097	0.0974
3.....	1,770	0.0557
4.....	4,425	0.1391
5.....	1,770	0.0557
Clear water basin.....	1,075	0.00896

LEAKAGE OF UPPER ROXBOROUGH FILTERS.

Area (one filter) 30,928 square feet, depth of water 9 feet.

Percentage loss of filters, based on a daily flow of 3,195,000 gallons through each filter, and of 20,000,000 gallons per day through the clear water basin:

FILTER	Leakage in 24 hours	Percentage loss
1.....	0	0
2.....	0	0
3.....	690	0.0216
4.....	0	0
5.....	1,150	0.0360
6.....	460	0.0144
7.....	1,840	0.0576
8.....	1,150	0.0360
Clear water basin.....	3,300	0.00165

Each of these structures was under test for leakage from two to four weeks, the losses of level being taken by hook gauges reading to .001 foot, and corrections made for gain by rainfall, or loss by evaporation.

Leakage of Water Mains.—Like the leakage of tanks and reservoirs, information on the actual leakage of large pipe systems is not nearly as full as it should be, and the lack of it often leads to unpleasant discussions with contractors upon the reasonable allowable leakage of pipe systems when completed and offered for acceptance and use. It is convenient to state the leakage in gallons per day of 24 hours, per mile of pipe without regard to the various sizes embraced in the system. It is obvious that a mile of 48-inch cast-iron pipe should show and be allowed a greater leakage than a mile of 12-inch pipe, and it would be much fairer and more accurate to state the leakage in gallons per 1,000 (or other measure) linear feet of lead pipe joint, because the leakage whatever it may reach in gallons per day is almost exclusively at the joints. According to Mr. James R. Croess, in his report to the Merchants' Association, on the 'Waste and Consumption of Water in New York City, 1900,' the leakage of the pipe distribution system of that city is as high as 142,000 gallons per mile per day of 24 hours, and of Brooklyn, 60,000 gallons per mile per day; of Boston, 14,187 gallons per mile per day. The leakage of the pipe system of Fall River, where 94 per cent of all the water services are metered, is estimated as 24.40 per cent of the whole consumption; at Boston the leakage is estimated as 27.30 per cent of the whole consumption.

Carefully conducted tests for leakage of the several systems of pipe connected with the Bel-

WATER SUPPLY

mont Filters, Philadelphia, furnished the following information:

Main supply pipe, consisting of 1,900 feet of 48-inch pipe, 280 feet of 42-inch pipe, 670 feet of 36-inch pipe, 190 feet of 30-inch pipe, 360 feet of 24-inch pipe, and 340 feet of 20-inch pipe, total 3,740 feet, or 0.7083 mile, under a pressure of 50 pounds per square inch lost water at the rate of 4,030 gallons per day, corresponding to a leakage of 5,690 gallons per mile. Main effluent pipe, consisting of 2,610 feet of 48-inch pipe, 140 feet of 42-inch pipe, 120 feet of 36-inch pipe, 430 feet of 30-inch pipe, 470 feet of 24-inch pipe, and 730 feet of 20-inch pipe, total 4,500 feet, or 0.852 mile, under a pressure of 50 pounds per square inch lost water at the rate of 8,640 gallons per day of 24 hours, corresponding to a leakage of 10,140 gallons per mile. The raw water drain pipe consisting of 1,820 feet of 24-inch pipe and 840 feet of 20-inch pipe, total 2,660 feet, or 0.504 mile, under a pressure of 50 pounds per square inch, lost water at the rate of 5,040 gallons per day of 24 hours, corresponding to a leakage of 10,000 gallons per mile. The effluent drain pipe, consisting of 1,440 feet of 24-inch pipe, 570 feet of 20-inch pipe, and 440 feet of 18-inch pipe, total 2,450 feet, or 0.464 mile, under 50 pounds pressure per square inch, lost water at the rate of 2,448 gallons per day of 24 hours, corresponding to a leakage of 5,276 gallons per mile. The refill pipe, consisting of 1,670 feet of 20-inch pipe, and 760 feet of 16-inch pipe, total 2,450 feet, or 0.46 mile, under a pressure of 100 pounds per square inch, lost water at the rate of 6,480 gallons per day of 24 hours, corresponding to a leakage of 14,087 gallons per mile. The pressure pipe which supplies water under 80 pounds pressure per square inch to the sand ejectors and washers, consisting of 460 feet of 20-inch pipe, 750 feet of 16-inch pipe, 170 feet of 12-inch pipe, 360 feet of 8-inch pipe, 640 feet of 6-inch pipe, and 450 feet of 4-inch pipe, total 2,830 feet, or 0.536 mile, under a pressure of 100 pounds per square inch, lost water at the rate of 2,500 gallons per day of 24 hours, corresponding to a leakage of 4,664 gallons per mile. The average diameter per mile of each of these lines or systems of pipes is larger than that of cast-iron pipe in a city pipe distribution system.

Considering the percentage loss based on the daily flow of water through the pipes, the losses were as follows:

LINE OF PIPE	Percentage loss
Main supply	0.0101
Main effluent	0.0216
Raw water drain	0.1008
Pressure	0.02083

Filtration.—No single aspect of public water supply is to-day of more importance than the quality of the water supplied from day to day. Upon the quality of the water may rest the health and commercial welfare of a community. Many cities have been temporarily injured by the known bad quality of their water supply, and many distressful and costly epidemics of typhoid fever may be properly attributed to the temporary use of a sewage polluted water. The remedy for this condition may be found in changing the source of supply, when this is possible, but for some cities the only alternative is the adoption of some method of water

purification which will eliminate the germs of disease from the water. The only practical method of purification thus far adopted by cities is filtration, of which several systems have been tried, but only one of which, that is, plain sand filtration, has successfully withstood the test of time. The filtration of water for public use was first installed by Mr. James Simpson at the Chelsea Waterworks, London, 1838. Parliament in 1852 passed an act requiring all the so-called river works of London to filter their water before it was delivered to the consumers.

No substantial difference exists between the original plain sand filter proposed by Mr. Simpson in 1838 and the modern plain sand filter which is being carried out at the present time (1904) on a grand scale for the city of Philadelphia. In each case the filter consists of a masonry tank in the bottom of which are placed pipes to conduct away the filtered water; above and around the pipes is spread coarse gravel ranging in material as large as one's fist to coarse sand, upon which is placed a bed of so-called filter sand, with suitable arrangements in the matter of pipes and valves to control the rate of inflow of unfiltered water to the filter, and of filtered water from the filter to the clear water basin. However, the subsequent extended use of plain sand filters in several of the larger cities of Europe, notably Saint Petersburg, Warsaw, Dantzic, Berlin, Bremen, Hamburg, the works of London, Edinburgh, Liverpool, and other cities of the United Kingdom, has had the effect of largely improving the mechanism required for the proper control of such filters. It is altogether probable that the first filter built by Mr. Simpson at the Chelsea Works, London, may have given as satisfactory effluents as any built subsequently, but the lack of convenient and proper analytical tests at the date mentioned makes it impossible at the present time to show what changes were effected by Mr. Simpson's very simple yet very wonderful adjunct of water-works which are compelled to draw their supplies from sources of known or suspected sewage pollution.

The real merits of the plain sand filter were never understood until after the improvements in bacteriology, made by Dr. Robert Koch, became a part of water analysis, in fact all the refinements for the technical investigation of water supplies have been developed, and many of them perfected, within the last 20 years. If the means of technical water investigation had been as good 60 years ago as they are to-day, and the same interest felt by communities in the character of their public water supplies, filters would to-day be as much a part of municipal water-works (where the water is drawn from streams, lakes, and ponds which receive sewage effluents) as is the pumping machinery, storage, and settling reservoirs, stand-pipes, and the cast-iron or other mains which convey the water to the consumer. Pumps, pipes, and reservoirs are regarded as essentials of water-works, and the proposition to incorporate each or all in any system of works excites only ordinary business interest, and involves only two simple considerations: first, the capacity of such details; and second, the cost of construction, operation, and maintenance, while filters at the present time are still regarded, if not as unproven details of water-works con-

WATER SUPPLY

struction, certainly as details, the efficiency of which is still a matter of doubt; and this condition may be ascribed very largely to the lack of facilities for the technical investigation of water going to and coming from the older filters in the cities of Europe, rather than to any lack of efficiency in the performance of the filters. When Mr. James P. Kirkwood, the father of water-works engineering in the United States and one of the most distinguished members of the profession, visited Europe in behalf of the city of Saint Louis, to examine and report on the filters at that time in operation in London, Berlin, and other cities abroad, it is probable that the filters generally were performing as well then as they are now. Perhaps their work from day to day was not as regular as it is now because the means and facilities for measuring the work and controlling the operation of the filter were not at that time so well established as they are now. Substantially the only real attempt to improve the art of filtration of public water supplies since the publication of Mr. Kirkwood's classic report on the filtration of river water, and indeed since the introduction of the plain sand filter at the Chelsea Works in 1838, has been to reduce the cost of constructing and operating the filters, to materially increase the rate of percolation, or to maintain a constant high standard of efficiency without regard to the quality of the applied water. The only obstacle to the broad introduction of plain sand filters with suitable adjuncts for the purification of a sewage polluted public water supply, is the lack of confidence in the practical results to be obtained, and when this confidence is established, as it will be in due time, it will then be a matter of wonder why so many of the large cities of the United States like Boston, New York, Philadelphia, Baltimore, Cleveland, Cincinnati, Saint Louis, and Chicago have been willing to continue the use of polluted public water supplies for so long a time, when the remedy was to be found in engineering structures, simple of construction and operation, and as certain in the performance of their work as the highest class of pumping engine used to lift water from lakes and rivers to settling and storage basins, or to pump it under stand-pipes into the distribution mains. It is a fact not often recognized that in any large city upward of 90 per cent of the population, where the source of water supply is from the public mains, are wholly dependent upon the city, not only for the quantity but for the quality of their water for all purposes. Nine tenths of the people are unable, or unwilling, to adopt domestic appliances for the purification of polluted water, and unless the municipality undertakes to supply a satisfactory water, fully this proportion of the population, by force of circumstances or indifference, will continue to use such water as may come to them through the street mains, and any steps which a city may take to broadly improve the quality of its water supply may properly be regarded as an effort to improve the health of at least nine tenths of its population. The wealthier residents of any city may easily overcome the objections to a polluted water supply, so far as it affects their own homes only, by the introduction of domestic filters, many of which, if properly attended to, can be relied upon to fur-

nish satisfactory drinking and culinary water, but this is only a partial safeguard even to the users of the water, because it will guarantee satisfactory water only in their own homes, and when they leave their homes for places of business or pleasure they may be compelled to use the polluted water, and the effect of their individual efforts to improve the quality of the water in their respective homes will be partially lost. The influence on health of a bad water supply for a large city is not limited to the city, but will have a far-reaching effect on cities many miles distant by reason of the intercourse between the larger and the smaller cities. It is thus possible for the polluted water supply of a large city to partially defeat the effect of a very perfect supply in some of the smaller cities surrounding it, visitors from the smaller to the larger city drinking the polluted water, and carrying away the germs of typhoid fever, and other water-borne diseases.

As matter of interest in connection with the filtration of large volumes of water daily for city use, the following technical results from the operation of the Upper Roxborough filters, Philadelphia, are offered. These filters were first put in service during July 1903, and the results show how well they were performing within one month of starting. The daily capacity is 20,000,000 gallons.

Turbidity is stated in parts per million by the silica standard. The bacterial content of the water is stated in colonies per cubic centimetre of water sample:

OPERATION OF UPPER ROXBOROUGH FILTERS.

Belmont Filtration Works.—The Belmont Filtration Works will supply that part of Philadelphia which lies west of the Schuylkill River, consisting at present of a population estimated at 170,000, growing at the rate of 3.64 per cent per annum, and which, it is assumed, will have a population in 1950 of 550,000 in round numbers. The water supply is pumped from the Schuylkill River at the present Belmont Station, located on the west bank of the Schuylkill River about in the centre of the west division of Fairmount Park.

The works consist of two subsiding basins, executed partly in excavation and partly in embankment, having a total depth from the top of the embankment to the floor of the reservoir of 29 feet, and an available water depth of 25 feet. The reservoir consists of two divisions, known as the East and West Divisions, which contain a flow line of about 36,000,000 gallons, representing at the present time about 2.4 days' sedimentation of the water before it is drawn from the basins to the preliminary filters. Each basin has an inside and outside

slope of two horizontal to one vertical, the interior of the floor and the slope being first covered with a heavy layer of clay puddle rolled in place, over which is placed a five-inch thickness of concrete paving as a monolith, upon which up to within 10 feet of the high water line is placed a layer of asphalt $\frac{5}{8}$ -inch thick. The clay puddle consisted of 50 per cent of mixed clay and 50 per cent of clean stone ballast, tempered in an ordinary pug mill, and placed and rolled on the floor in two separate layers. Upon the slopes the puddle was rolled in layers six inches thick in excess of the actual requirements, and the surplus trimmed off to true slope lines.

From the sedimentation reservoir the subsided water is conveyed to a system of 20 preliminary filters, consisting of concrete tanks 60 feet long, 20 feet wide, and 8 feet deep, in which are placed materials very much like that in the plain sand filters excepting that the sand is more uniform of grain and coarser; the underdrain material at the bottom is likewise made up of coarser material and placed 12 inches deep, with suitable pipes to conduct the subsided water to the filters, and to conduct the pre-filtered water to the plain sand filters, and a system of wash pipes by means of which the bed of sand lying above the underdrain material is washed in place from time to time as may be required. The purpose of the preliminary filters at Belmont, and at the other works forming part of the improvement of the water supply of Philadelphia, is three-fold: first, to enable the plain sand filters to operate at a higher rate than has heretofore been employed, and correspondingly reduce the acreage of plain sand filter surface required to treat the subsided water; second, to prolong the life and increase the yield of the plain sand filters between scrapings from 60,000,000 or 70,000,000 gallons per acre, to from 90,000,000 to 150,000,000 gallons per acre; third, to obtain a more regular and better effluent than is possible with the plain sand filter when supplied only with water which has been undergoing subsidence for a few days. The preliminary filters are intended to perform in a short time what could be accomplished only in a very long time by simple sedimentation.

The plain sand filters at Belmont consist of 18 covered concrete tanks, arranged in groups of six each, having dimensions varying from 196 to 272 feet in length, and from 120 to 165 feet in width, giving a net area of filter at the sand line of 0.735 acre. The floors of the filters consist of concrete inverted arches 15 feet 3 inches square, with a depth of arch at centre of eight inches, a thickness of six inches at the centre, and of 14 inches under the piers. The roof arches have the same span as the floor inverts, a rise at the centre of 36 inches, a thickness at the crown of 6 inches, and of 15 inches at the spring line normal to the soffit. The roof arches are carried on monolithic concrete piers, 9 feet 1 inch high, 30 inches square at the base, and 22 inches square at and above the sand line, giving a total height from the centre of the invert under the floor to the centre of the roof arch of 12 feet 9 inches. Against the side and end walls of the filters a layer of concrete (mixed and placed as in the sedimentation reservoir) is rolled or rammed in place to render the filters watertight. The end

WATER SUPPLY

walls of all filters, and the side walls of the end filters, are designed as abutments to transmit the arch thrust to the foundation. In the roof of each filter is placed a system of ventilators which can be opened in the summer time to ventilate the filter when the sand bed is being cleaned, and the filter being prepared for another run, but in winter time these ventilators are closed in order to avoid freezing of the sand at any time when it is laid dry for the purpose of scraping. Above the concrete arched roof of the filter is placed a thickness of 36 inches of earth rolled in place, finished with top soil and seeded, in order that in due time the upper surface of the filter, as well as the slopes, will be covered with a neat turf, partly for protection of the materials in the earth fill over and around the filters, and partly to improve the appearance of the work. Each filter is provided with automatic regulators, one on the influent pipe to maintain a constant level of water over the sand bed, and the other on the effluent pipe to maintain a constant rate of operation of the filter, and incidentally to measure its rate and amount of work. The regulators are controlled by large copper floats which rise and fall with changes in the level of the water. In the effluent chamber the regulator consists of a telescoping weir which gradually descends in its guiding pipe until the depth of water in this chamber represents the maximum loss of head under which it is desired to work the filter. The relation of the lip of the weir to the copper float from which it depends is adjustable in order to vary the rate of percolation through the filter, thus when first put in service the rate of operation may be 1,000,000 gallons per acre per day of 24 hours, and in the course of two or three days the rate is increased to 6,000,000 gallons per acre per day, by the adjustment of the relation of the lip of the weir to the surface of the water in the effluent chamber. The telescoping tube slides through an annular cup leather packing, which maintains a watertight joint between the tube and the barrel into which it slides. In the centre of each filter at the bottom is placed a main collector with which are connected at intervals of 15 feet 3 inches the lateral collectors that reach from the main collector nearly to the side walls of the filter tank. The main collector is a watertight channel, constructed of concrete, and the lateral collectors are made of eight-inch and six-inch vitrified terra cotta pipes, perforated for their entire circumference from end to end. Around the main and lateral collectors to a depth of 16 inches above the lowest point in the floor of the filter is placed the underdrain material consisting of five sizes of gravel, ranging from three inches in diameter to material that will pass a No. 14 sieve and be intercepted on a No. 20 sieve, arranged in successive layers of six inches, four inches, three inches, and one inch, the smaller material, of course, being placed at the top in the one inch layer.

In placing the underdrain material in the filter, three different plans have been followed; one in which the material is placed horizontally from wall to wall of the filter impinging against the intermediate piers; another in which the underdrain material impinges against the piers but is kept a distance of 24 inches from the side walls, and still another, which is

regarded as the ideal arrangement, in which the underdrain material is kept 20 inches from the piers and 24 inches from the end and side walls. In the latter plan it is impossible for water to flow down between the masonry of the piers or walls of the tank, and pass into the underdrains without percolating horizontally through at least 20 inches of sand.

The sand in the filters consists of either river or bank sand, properly freed from clay, dirt, and organic matter, ranging in size from grains which will pass a sieve having six meshes to the linear inch, to grains which will not readily pass a sieve having 80 meshes to the linear inch. The sand is placed to a depth varying from 28 to 42 inches over the underdrain material, and constitutes the true filtering material. When the surface of the sand bed becomes clogged with the suspended matter removed from the water, and the maximum loss of head is reached, the filter is taken temporarily out of service, and the layer of sand at the surface is carefully scraped off for a depth of from one half to one inch, and heaped in little piles in the several bays of the filter. After the filter has been scraped the sand is thrown out by an ejector, worked by a current of water under pressure of from 60 to 80 pounds per square inch, to the sand washers in the courts in front of the filters, where, after it is washed, the sand is stored until such time as it becomes desirable by successive parings of the sand bed to renew the full depth of sand in the filter.

From the filters the water is conveyed through cast-iron pipes 48 inches in diameter, to a clear water basin constructed with concrete inverted arches under the floor, square plumb piers, and concrete arches of the same dimensions, and in the same manner as the filters, excepting that the total height from the centre of the floor invert of the clear water basin to the crown of the arch at the soffit is 18 feet, which provides for a water depth of 15 feet. From the clear water basin the filtered water is conveyed through cast-iron pipes into the distribution system.

The Belmont filters are intended to operate at the rate of 6,000,000 gallons per acre per day, giving a capacity for each filter in service of 4,410,000 gallons, corresponding to a rate of percolation through the sand bed of 19 feet per day of 24 hours, or of nine inches per hour. The daily capacity of the Belmont station (18 filters), allowing 15 per cent reserve for scraping, washing, and renewal of sand, and such other operations as may require filters from time to time to be temporarily out of service, is 65,000,000 gallons, although for the first two years they will be operated not in excess of the capacity of the preliminary filters, namely, 40,000,000 gallons per day. By the addition of 25,000,000 gallons preliminary filter capacity this station will be raised to 65,000,000 gallons per day, which is thought to be sufficient to meet the requirements of that portion of the city lying west of the Schuylkill River for a period of 25 or 26 years, after which time, not only will the preliminary filter capacity be raised, but additional filters will be built on land reserved for the purpose south of the present installation.

Population and Pipe Mileage.—The most expensive waterworks to build and maintain,

WATER SUPPLY

other things being equal, will be that in which the population per mile of pipe distribution system is the least. The city of Denver contains one mile of distribution pipe for every 304 of the population. At one time this city was supplied by two rival companies, and in many miles of streets the distribution mains are duplicated. Prior to the consolidation of the Denver Union Water Company and the Citizens' Water Company over 70 miles of the former company's mains had been paralleled by its rival, and the competition at one time was so strong that one or both companies actually furnished water to their consumers without charge; eventually the two companies combined in the Denver Union Water Company, and the consolidation then owned the mains of the two former companies. This fact, in part, accounts for the excessive mileage of pipe relative to population in that city. The influence of a dense population in Greater New York is shown in the very large population per mile of water pipe, which is nearly two and one half times that of Philadelphia and Saint Louis, and three times that of Boston. Omitting the cities of New Orleans and Nashville, in which, by reason of the large percentage of colored population, the mileage of pipe is small compared with population, New York, in which the population per square mile of territory is very large, and Denver, where the condition of pipe mileage is abnormal compared with population, it

will be seen that in all the other cities the relation of population and mileage of distribution pipe is fair, the population per mile of pipe increasing generally with the size of the city.

MILEAGE OF WATER PIPES OF VARIOUS CITIES AND THE POPULATION SUPPLIED.—1900.

WATER SUPPLY

to unusual efforts in the attempt to reach an engine economy not attained by any other type of steam-engine. Higher steam pressures, higher piston speeds, higher expansions, and improved shop work have enabled the builders to obtain duties to-day which 20 years ago were thought by many to be unattainable with steam-engines. As a rule the more modern engines are being built in larger units, partly to diminish the cost for a given daily pumping capacity and partly by reason of the improved materials, design, and shop work entering into the construction of these machines which largely diminishes the probability of serious derangement or accidents in service. In the preceding tables all the engines noted are of the crank and fly-wheel type, all have steam jacketed cylinders, and with the exception of some of the pumping engines built by the I. P. Morris Company, all are constructed with single acting plunger pumps. The present cost (1904) for triple expansion crank and fly-wheel pumping engines per million gallons of capacity against 100 feet pumping head is about \$2,650.

Consumption, Income, Operating, and Maintenance Charges.—Interesting data on the operation of city water-works is found in the official reports of the cities, and in the statistics of the operation of private companies, from which it is shown that in a long established works, irrespective of population, water supplied per day and income, the operating and maintenance charges, excluding expenditures for extensions and betterments, fixed charges on bonded indebtedness and taxes (which, of course, are paid only by private water companies), are roughly about 30 per cent of the income from water rents. In exceptionally well managed works, like those of Providence, R. I., and Milwaukee, Wis., in both of which meters form a part of the water supply system, the operation and maintenance charges are considerably less than 30 per cent of the income from water rents. In other works where the management is less systematic and rigid, or where the conditions connected with the supply of water are more onerous than in the cities mentioned, the operation and maintenance charges are considerably more than 30 per cent of the income. In determining the income

which should be received from water rents by a system of water supply, whether operated by the municipality or by a private company, in which it is known that the property is conducted in a careful and economical manner, it will often assist the managers to know the relation which the income from water rents should bear to the known cost of operation and maintenance, and this being known, to adjust the water charges equitably among the various kinds of consumers to produce the income required to meet all the natural charges created by a system of public water supply. These charges may be divided conveniently as follows: first, operation and maintenance charges; second, extension and betterment charges; third, taxes, if the works are owned and operated by a private corporation; fourth, the fixed charges on the cost of construction or bonded indebtedness; fifth, an annual allowance for the renewal of such parts of the works as, for example, pumping engines and boilers, which are subject to a known rate of deterioration; and sixth, if the works are owned and operated by a private company, a reasonable allowance for dividends on the capital stock.

The last five items will usually absorb in round numbers about 70 per cent of the income from water rents.

The table below is an abstract from an elaborate compilation of statistics from the cities noted, which was used a few years ago in the trial of a cause in the United States courts to adjust a difference between the municipality and the water company. In this particular instance it was a well established fact that the works were well constructed, and operated upon a very careful and economical basis, and in order to furnish data upon which the court could safely fix the income to which the water company was entitled, it was necessary to arrive at this income in the indirect manner shown by the table.

Where the quantity of water to be pumped is small, it will often be found very convenient to use gas or gasoline engines and triplex pumps. Works up to 2,500,000, or more, gallons per day have been planned and are operating on this system. The advantage of the gasoline engine is that it entirely avoids the ex-

WATER TABLE—WATER WHEEL

pense for boiler house, the cost of operating and maintaining boilers, the expense of chimneys, and if the water is pumped to reservoirs, whenever the machinery is temporarily out of service there is no cost due to banking fires and maintaining steam pressure, as is the case with a steam operated works. See WATER-WORKS.

JOHN W. HILL, C.E.,
Chief Engineer, Department of Public Works,
Philadelphia, Pa.

Water Table, in architecture, a projecting stone sloped on the roof to throw off water. It occurs in buttresses and other parts of Gothic architecture.

Water Thermometer. See THERMOMETER.

Water-thrush, an American warbler of the genus *Seiurus*, having terrestrial habits and frequenting preferably the borders of streams; its domed nest in the woods gives the name oven-bird to the common resident species (*S. auricapillus*). See WARBLER; WAGTAIL.

Water Turbine. See TURBINE; WATER WHEEL.

Water-turkey. See DARTER.

Water Valley, Miss., city, one of the county-seats of Yalobusha County; on the Illinois Central railroad; about 140 miles north by east of Jackson, the State capital, and 15 miles north of Coffeeville, the other county-seat. It was settled in 1855 by William Carr; incorporated in 1867, and chartered as a city in 1890. It is in an agricultural region, in which cotton is one of the principal products. It has considerable lumbering interests. The chief manufacturing establishments are cotton mills, railroad repair and construction shops, in which there are 500 men employed, a lumber mill, foundry and machine shops, and woodworking factory. The city owns and operates the electric-light plant and the waterworks. There are seven Church denominations, the Methodist State Orphans' Home, the McIntosh Training School, and public schools for both races. The two banks have a combined capital of \$48,000. The government is vested in a mayor and board of aldermen consisting of seven members elected every two years. Pop. (1890) 2,832; (1900) 3,813.

G. D. BROWN,
Editor 'The Progress.'

Water Wheel, a device by which the motive energy in falling water is utilized to perform mechanical work. Water acts as a motive power by its weight, or by pressure and impact, and the water wheels adapted to these various conditions may be divided into two general classes—the "vertical," consisting of the "overshot," "breast," and "undershot" wheels; and the "horizontal," which includes a great variety of turbine or reaction wheels. The impact or impulse wheels are included in both classes. The term water wheel is correctly applicable to all forms of water motors that rotate, but in the present case it will be restricted to those of the vertical class which are actuated mainly by the weight of water loaded on their circumferential parts. For those belonging to the horizontal class, see TURBINE.

The overshot wheel is provided with a number of buckets fixed to its periphery in such a way that as the wheel revolves from left to right the buckets on the descending side have their tops upward, and being filled with water at or

near the top of the wheel, exerts a downward pull and imparts a rotary tendency to the wheel. The water is admitted to the wheel by various methods, such as the overfall sluice, the penstock, and the guide bucket, in all of which the water is guided in a course tangential to the buckets, and acts partly by impact, but principally by weight. To obtain the greatest efficiency, the number of buckets ought to be as large as possible and so arranged as to hold the water as long as practicable. The buckets vary in form, but the greatest effect is obtained from curved buckets, the "radial" giving only about 75 per cent of the power obtainable by the use of "elbow" buckets. Overshot wheels may be constructed of wood or iron in any size. The earlier forms were massive structures built of wood, and often measured 70 feet in diameter, but the modern wheels are generally built of iron and are practically limited by construction to falls less than 60 feet in height.

In the breast wheel the water is received by the buckets above the centre and below the top of the wheel. It is most effectively employed in connection with falls ranging from 5 to 20 feet, and where the flow ranges from 5 to 90 cubic feet per second. The buckets are generally held in a curb, and, not being required to hold water, are set radially. Their number is made as large as possible, and they are set at such an angle that they leave the water vertically so as not to carry up water from the tail-race. The breast wheel is more effective than the overshot under a variable water supply, since it can be made of a greater diameter and affords an increased facility for the reception and discharge of the water by the buckets.

The undershot wheel receives the water below its horizontal centre line. Instead of buckets it is equipped with a series of paddles or vanes fixed to the periphery in such a way that the flowing water passes under the wheel, pushes against the paddles, causing rotation. It is usually set in a curb with a minimum amount of clearance for the escape of the water. The most effective curbs are concentric to the wheel, those set straight or tangential allowing too much waste. The paddles are set radially and inclined upward in order to be readily relieved of water upon the return side.

For falls not exceeding six feet, the most effective wheel is the Poncelet. In it the water acts in a manner very similar to its action in a turbine, and although not quite as efficient as turbines working under normal conditions, it is superior when working under a reduced water supply. The buckets are curved, and the water flowing along their concave sides presses upon them without impact and with greater effect than that of water impinging at right angles against buckets with plane surfaces. The effect of the wheels increases with the depth of the water, and the velocity of rotation is equal to about one half the velocity of the flowing water. The simplest form of the "impact" wheel consists of a series of rectangular buckets fixed upon a wheel at an angle varying from 50 to 70 degrees to the horizontal. The water is conducted to it through a pyramidal flume set at an angle varying from 20 to 40 degrees, so that it strikes the blades nearly at right angles. The normal effect is about 5 per cent of the total mechanical power of the flow, but this may be increased somewhat by increasing the length of

WATER-WORKS

the paddles, so that the water exerts a combined impinging and pressing force.

In another form, known as the "impulse" wheel, a series of cup-shaped buckets attached to the periphery of the wheel are acted upon by a jet of water conducted by a pipe and delivered through a nozzle tangentially against the cups. Of this form the most notable are those of the Pelton type, which vary from 5 to 20 feet in diameter and are extensively employed to work air compressors in mining operations. A wheel of the maximum size is capable of developing 350 horse-power, under a 700-foot head of water.

In general, as compared with turbines, vertical water wheels are the more effective when applied to falls ranging from 20 to 40 feet. The turbines are more efficient with low falls, on account of the great hydraulic resistance developed by very high falls, which increases as the square of the velocity. On the other hand, since turbines are run at a greater number of revolutions, they are more suitable to general mechanical purposes, while vertical wheels are better for purposes requiring low velocities, and in the operation of rolling mills where the varying resistances are controlled by the mass of the wheel.

There is not much difference in the cost of construction, but the durability of the turbine is less than that of the vertical wheel.

Bibliography.—Good descriptions of water wheels are scattered through the various engineering periodicals. Especially valuable data may be obtained from Weisbach, 'Hydraulics and Hydraulic Motors,' English translation by Du Bois (New York 1877); and Bjorling, 'Water or Hydraulic Motors' (London 1894). See also TURBINE; WATER-POWER; WATER MOTOR.

W. MOREY, JR.,
Consulting Civil Engineer.

Water-works, systems of machinery and engineering structures, employed to supply water to individual manufacturing, mining, and milling plants, and to municipalities, for domestic and industrial uses. Such systems existed during very early periods of history, and the water-works of ancient Greece, Carthage and Rome may be readily traced and studied by the ruins of their reservoirs and masonry aqueducts. In these earlier systems, gravity was depended upon for the delivery of the water, but force pumps were introduced about the middle of the 16th century, and extended greatly the general application and use of water-works systems. Of these the water-works built at London Bridge by Peter Maunrice 1562 appear to be the first. The installation consisted of 16 force pumps, each 17 inches in diameter, and 30 inches long, which were driven by a current wheel, and raised 311,000 gallons of water per day to a reservoir at an elevation of 120 feet above the pumps, and from which the water was delivered by gravity, through lead pipes to buildings in the immediate vicinity.

In the United States, the first pumping plant installed to provide water for municipal purposes, was that at Bethlehem, Pa., about 1760. It consisted of a five-inch wooden force pump, which raised water to a height of 70 feet through pipes of bored hemlock logs. This was replaced in 1761 by three single-acting iron pumps, each 4 inches in diameter, and of 18-inch stroke, op-

erated by an undershot water-wheel. The first municipal water-supply system built in America, however, was that of Boston, in 1652. It was built by the Water-Works Company, and consisted of a reservoir about 12 feet square, to which the water from springs in the vicinity was conveyed through wooden pipes. From 1652 up to the close of the year 1800, the water-works plants in the United States numbered 16, and had been located and built at the following named cities: Boston, Mass., 1652; Bethlehem, Pa., 1754-1761; Providence, R. I., 1772; Geneva, N. Y., 1787; Plymouth, Mass., 1796; Salem, Mass., 1795; Hartford, Conn., 1797; Portsmouth, N. H., 1798; Worcester, Mass., 1798; Albany, N. Y., 1798-1799; Peabody, Mass., 1799; New York City, 1799; Morristown, N. J., 1799; Lynchburg, Va., 1799; Winchester, Va., 1799-1800; and Newark, N. J., 1800. With the exception of the plants at Winchester and Morristown, they were all built by private concerns, but passed into the ownership of the respective municipalities from time to time up to 1860. The works at Winchester were built by the municipality, and those at Morristown were built by a private concern and still remain in private ownership. From 1800, up to the present time (1904), the number of plants installed throughout the country amounts to about 3,200, of which 1,700 are under municipal, and 1,500 under private control.

A clear and concise consideration of the subject of water-works may be facilitated by arranging the various requirements under the four general headings—quality, sources of supply, modes of distribution, and public policy.

Quality expresses the fitness of the water for the various purposes for which it may be required. A good quality of water is characterized by a freedom from turbidity and color, unpleasant taste and odor, and sewage contamination.

Turbidity is a condition caused by clay and silt suspended in the water. When the source of supply is a river, this condition is subjected to great variations according to the amount and character of the rainfall over the watershed. Heavy rains of short duration are drained off with great erosive effect, and introduce into the flowing rivers vast quantities of finely divided inorganic matter. This impurity, however, is more offensive than harmful, unless taken into the system frequently or in large quantities. It is removed by the use of large settling reservoirs where the water is allowed to rest and deposit the heavier particles, before it is passed over the filter-beds by which the smaller particles are removed. (See WATER SUPPLY.) Color is a condition still more offensive to the eye than harmful to the health. The apparent color due to turbidity disappears under the processes of sedimentation and filtration, but true color, generally due to infusion of vegetable organic matter, such as leaves, grass, etc., is much more difficult to remove.

Odor is a condition which, although less frequent, is much more harmful than turbidity or color. As a rule it is due to the life processes of minute organisms, and is removable to a considerable degree by filtration.

Sewage contamination is the most harmful of all the various forms of impurities natural or artificial that a water supply may be subjected to, and is the direct cause of epidemics of typhoid fever and various troubles of the intes-

WATER-WORKS

tines, which by undermining the constitution reduces its power of resistance to diseases. The water may be somewhat purified by filtration, but the proper method is to remove the source of pollution.

The quality of water is ascertained by various kinds of analyses, physical, chemical, and bacteriological, which, however, at their best, are only capable of indicating the probable safety or danger of a given sample of water. Physical analyses consist merely of comparisons of the given samples with standard solutions, and afford data relative to temperature, turbidity, color and odor.

Chemical analyses indicate the time of past contamination, and the nature of its origin—animal or vegetable. Bacteriological analyses are principally used to ascertain the absence or presence of the growths which cause bad taste and odor. Such analyses are capable of showing the number and probable origin of the bacteria present, but in matters of differentiation, as in the case of the typhoid germ from the harmless water bacteria, their operation is quite uncertain.

The results obtained by any set of analyses are generally interpreted by chemists and engineers by comparing them with other known facts, without attempting to establish a system of arbitrary standards. A minimum limit of impurity, however, may be stated, as follows:

(1) The best authorities consider water as bad or polluted when 100,000 parts of the liquid contain more than three parts by weight of mineral matter or one part by weight of dry organic matter, before it has been submitted to precipitation, or when it holds in suspension more than one part by weight of dry organic matter after 6 hours of perfect repose in a reservoir.

(2) When the same amount of liquid contains in solution more than two parts by weight of organic carbon, or three parts of organic nitrogen.

(3) If it exhibits a distinct color under daylight when placed in a white porcelain dish, to the depth of one inch.

(4) When 100,000 parts of the liquid contain more than two parts by weight of any metal except calcium, magnesium, potassium and sodium.

(5) When 100,000 parts of the liquid contain in solution, suspension, or chemical combination, more than 0.5 of metallic arsenic.

(6) When 100,000 parts of the liquid, after the addition of sulphuric acid, contain more than one part by weight of free chlorine.

(7) When 100,000 parts contain more than one part by weight of sulphur in the form of sulphuretted hydrogen, or a soluble sulphuret.

(8) When 100,000 parts of the liquid holds in suspension more than 0.5 of petroleum or hydrocarbon, or exhibits a film of the same upon its surface.

(9) When the acidity is greater than that produced by two parts by weight of hydrochloric acid to 1,000 parts of distilled water.

(10) When the alkalinity is greater than that produced by adding one part by weight of caustic soda to 1,000 parts of distilled water.

(11) When a cubic centimetre of water contains more than 250 bacteria.

In general, a large percentage of chlorine, and high nitrates, together with the presence of *coli communis*, a bacteria found in large quanti-

ties in the human intestines, indicates sewage contamination.

A very simple but reliable test for sewage contamination was suggested by Heisch. To half a pint of water placed in a clear colorless glass-stoppered bottle, add a few grains of the best white lump-sugar, and expose the bottle freely to daylight in the window of a warm room for a week or ten days. If the water remains clear it may be considered safe, but if it become turbid, it is open to grave suspicion of sewage contamination.

Turbidity or a precipitate due to the addition of baryta water indicates the presence of carbonic acid; chloride of barium indicates sulphates; nitrate of silver indicates chlorides; oxalate of ammonia indicates lime salts; sulphide of hydrogen, slightly acid, indicates antimony, arsenic, bismuth, calcium, copper, gold, lead, mercury, platinum, silver and tin; an alkaloid by ammonia solution of sulphide of ammonium, indicates alumina, chromium, cobalt, iron, manganese, nickel and zinc. While the chloride of gold or mercury and the sulphate of zinc indicate organic matter.

Hardness of water is a quality that bears chiefly upon its use for washing purposes. The hardening impurities are principally the salts of lime and magnesia. Their carbonates produce temporary hardness which may be removed by boiling, when the carbonic acid is dissipated and the insoluble bases are deposited as incrustations on the bottoms of the kettles and boilers. The carbonates are less troublesome to the human constitution than to steam users, but the sulphates, chlorides and nitrates of lime cannot be dissipated by ordinary boiling and are productive of what is known as permanent hardness. Ordinarily pure water can take up only about 2 grains of carbonate of lime per imperial gallon of 70,000 grains, but when carbonic acid is present, that amount of water will dissolve as much as 20 grains of the carbonate. The degree of hardness is estimated according to the number of grains of soap the solution is capable of neutralizing. Thus, one, two, and three degrees of hardness represent the neutralization of 10, 20, and 30 grains of soap, respectively. The amount of waste, in the wear of clothes and soap, and the destruction of many valuable food properties by the use of hard water is not fully appreciated by the general public. It is safe to state, that the money value of that waste far exceeds the cost that would supply an abundance of water for domestic purposes from a source free from impurities.

Systematic processes for softening water have been employed but rarely in the United States, and then principally in connection with the boiler and locomotive manufacturing plants. The first process was invented by Prof. Thomas Clark, of Aberdeen, Scotland, and 1841, and consists of mixing the water supply with lime water or milk of lime, and allowing it to subside for a period ranging from 12 to 24 hours, when the water is drawn off while the precipitate is left behind. The only softening plant in connection with a municipal water supply in America is that attached to the water-works of the city of Winnipeg, Manitoba. The source of supply is a number of artesian wells, and the water obtained is of a very hard quality. The softening process employed is a modification of that of Clark, and includes a variety of set-

WATER-WORKS

ting and filtering devices, into which the water is pumped and mixed with the lime solutions and then drawn off and distributed by direct pressure pumping into the mains. Its working, although not satisfactory in many ways, provides a water more beneficial to the health, and superior for domestic purposes, than that of the Red River, which formed the original water supply of the city. (See WATER SOFTENING.)

While boiling is a very cheap and thoroughly effective process of purifying water, and may be used by householders in general, distillation, owing to its expense, may be employed only in special cases, in connection with artificial ice plants, the conversion of salt into fresh water at sea, and in the various industrial arts. It will be noted, however, that both boiled and distilled water are very unpalatable unless aerated before used for drinking purposes.

Sources of water-supply will be found extensively treated under that title. In a general way, the origin of all sources is the atmosphere. It is a simple matter to trace the course of the water from the clouds in the form of rain to the rivulets which form the feeders to the lakes and rivers, and which percolating through the porous rocks and earth, issue as sparkling springs along the valleys. Some special suggestions, however, relative to the selection of a potable water is advisable in this connection. In the open country water reaches the ground in a fairly pure condition, and by selecting a site isolated from the drainage of barnyards, house sewerage, and fertilized gardens, an excellent quality of water may be obtained from a well. Extending the application to where the supply is for the use of a community, town or small city, subterranean reservoirs in which the great rain percolations are stored up, may be tapped by artesian wells and furnish an inexhaustible supply of pure water. In boring these wells, however, a thorough knowledge of the geological structure of the region is important (see ARTESIAN WELLS), in order to avoid unsuccessful and costly boring operations, as well as to obtain a sufficient quantity of water free from sub-surface impurities. Waters percolating through or over the crevices of granite, gneiss, serpentine, trappean, mica-slate or silicious sandstone and drift formations, are usually quite pure, since the disintegrations of such formations are not soluble in pure water. On the other hand, limestones and chalks impart objectionable qualities. Carboniferous rocks are often composed largely of mineral salts, and the water penetrating such strata are of a briny nature and are wholly unfit for domestic use. This is the case in the Kanawha Valley, and in some parts of Ohio, West Virginia, and the State of New York. In the bituminous limestones of the oil regions of Pennsylvania, the waters passing through those strata are saturated with petroleum compounds, while the dark waters issuing from the sulphurous rocks of the Niagara group of the Ontario geological division carry a high percentage of sulphuretted hydrogen.

As the municipality requiring the water increases in size, the quantity obtainable from a source of supply becomes more and more important. The per capita consumption varies greatly and very often quite unexplainably. See WATER SUPPLY.

In the ancient cities of Jerusalem, Rome,

Byzantium and Alexandria, the consumption amounted to 300 gallons per capita, daily.

In 1870, the water consumed by the principal European cities, in gallons per capita, was as follows: London 29, Liverpool 27, Glasgow 40, Paris 30, Marseilles 40, Genoa 30, Geneva 16, Madrid 16, and Berlin 18. On the other hand, it is not an unusual thing to find American cities consuming all the way from 100 to 250 gallons per capita. Without doubt, a great deal of the water in such cases is really wasted, but American hydraulic engineers in planning for a water supply under the present conditions, calculate upon the basis of a consumption of 100 gallons per capita, with provisions to meet an increased demand in the near future.

A fair average daily consumption may be approximately estimated as follows, in gallons per capita, on a basis of total population: For ordinary domestic purposes, 20 gallons; for private stables, including carriage washing, 3 gallons; commercial and manufacturing purposes, 16 gallons; fountains, drinking and ornamental, 10 gallons; fire protection, 2 gallon; private hose and sprinkling of streets and public grounds, during the four or five driest months of the year, 10 gallons; waste to prevent the freezing of water in the service pipes and house fixtures in northern cities, during the three coldest months of the years, 10 gallons; and waste by leakage, and for flushing purposes, 10 gallons; a total of about 80 gallons.

Thus for the larger cities, the selection of a source of supply passes from the wells and springs to the large ponds and lakes. Important examples of such are found in the cities of Chicago and Milwaukee, which draw their supply from Lake Michigan, and Cleveland and Buffalo, from Lake Erie. In the majority of cases the principal cities of the world obtain their water from rivers, although a great many, as in the case of New York, which draws its supply from Croton Lake, have adopted certain natural basins and converted them by artificial means, such as dams, etc., into immense reservoirs, fed solely by the rainfall over the drainage area. In such cases the principal mode of delivering the supply at the point of consumption is by gravity, through aqueducts, connecting the source of supply with the distributing mains. Intermediate settling and filtering reservoirs may be employed in connection with the source of supply to neutralize the conditions of turbidity, color, etc., inherent to surface waters, while auxiliary pumping stations may be built and operated in connection with standpipes if any part of the area using the water happens to be higher than the level of the source of supply.

On the other hand, when a river is the source of supply, its natural position in the lowest part of the valleys compels the elevating of its waters before delivery to the consumers. This is usually accomplished by pumping plants which elevate the water into reservoirs or standpipes from which it is distributed by gravity, or it is pumped direct into the distributing mains and thence into the service pipes. In either case, in planning a system of water-works, it is essential that proper provisions be made to insure a pressure of delivery that is constant and adequate to supply the consumption per capita for all domestic and industrial purposes, and of sufficient power to throw fire streams over the tops of ordinary buildings. A combination of the gravity

WATER-WORKS

and pumping systems is employed by the city of Washington. From the Great Falls of the Potomac, situated several miles west of the city, the water is conveyed through a conduit to receiving reservoirs on the heights adjacent to the city and after a period of subsidence is passed into the distributing reservoirs and thence to the service mains. Certain portions in the northwestern and northeastern parts of the city being higher than the receiving reservoir, pumping stations connecting with the distributing mains pump the water into standpipes in the elevated sections, from which it is delivered to the consumers by gravity. As a rule, the cost of establishing pumping systems to lift the water from the river from a point near at hand to the standpipes, is far less than that of building the necessary aqueducts to conduct the water from a point on the river a sufficient distance beyond to insure the required head or pressure. In the case of Washington, however, the arrangement is practically necessary since the sewage of the city flows into the river in the immediate vicinity, and the current of the river itself is affected by the ebb and flow of the tide to some distance above the city, so that the water immediately at hand is in a polluted condition. In this connection it may be mentioned that but a very small number of American cities are fortunate enough to obtain an abundant supply of water directly from natural sources sufficiently transparent and limpid for domestic purposes. The great majority are compelled to resort to artificial means of various kinds, such as storage and settling reservoirs, filter beds, and pumping plants, to insure the purity and quantity required.

The character of "pumping plants" varies according to the source and mode of supply, the motive power employed, and the working pressure on the pumps. In connection with the source and mode of supply, such plants are arranged for direct pumping, or for pumping into a reservoir. Direct pumping plants are liable to be affected by great and sudden changes in working pressure and therefore require machinery capable of responding quickly to such changes, with strong and simple working parts automatically regulated under variable speeds. On the other hand, since the machinery employed to pump into a reservoir works against an almost constant head or pressure, at a practically uniform rate of speed, a much greater latitude is presented in the economy of design and operation.

As a general rule, when the source of supply is more than 25 feet below the surface of the earth, economy in the matter of excavations and foundations compels the use of some form of a vertical rather than a horizontal pump. If the well is very deep two sets of pumps, one at the bottom and one at the surface, may be employed, or by the use of the air lift, the motive power may be kept at the surface of the ground. On the other hand, when the water has to be pumped from a river to a settling reservoir for purification, and then repumped into the distributing mains, under conditions involving a comparatively low lift, some form of horizontal or centrifugal pump is the most suitable. See PUMPS AND PUMPING MACHINERY.

Relative to motive power, it is evident that water power, when it can be obtained in a sufficient amount, is the ideal source of energy, since it is generally inexhaustible and always

cheap. If, however, it cannot be obtained during the whole year, it may be supplemented by steam or electric power, or by a system of storage reservoirs arranged to equalize the flow of the stream under the varying conditions of wet and dry seasons. The employment of steam, electric and compressed air power to operate pumping plants depends to a great extent upon the cost of fuel used. When the pumping plants are situated at points far from the fuel supply, they may be operated economically, within the limits of economical electric power transmission, by power derived from dynamos driven by steam-engines or the energy of waterfalls. Compressed air may be used to operate small plants located at a distance from the main plant, and also to operate air lifts where deep wells are the source of supply, while oil and gas engines are the most economical for operating isolated secondary pumping plants in large cities, or the main pumps of small towns and villages. It is a fact, however, that in a majority of the water-works throughout the world, steam is the motive power employed, the pumping engine usually combining the motive power and pump action in one machine. They are of several different types, and the adoption of any particular one depends practically on the cost of the fuel used. When that cost is great, high duty engines, although more expensive in design and construction, but capable of performing a relatively larger amount of work with a small amount of fuel, are adopted. See PUMPS AND PUMPING MACHINERY.

For specific information on the construction of reservoirs, filter beds, tanks and standpipes see WATER SUPPLY. In general, the most important point to be considered in planning a system of water-works, is that of procuring an ample and suitable supply of water. To insure this, natural bodies of water, such as ponds and lakes, are connected with reservoirs by dams across their outlets, or by large masonry structures, partially in excavation and partially in embankment, from which reserve supplies of water are drawn off into the distributing system to maintain a constant pressure under varying demands. Tanks and standpipes are practically small reservoirs, usually located above the ground, on wooden, steel, or masonry towers. Their specific application has been described in connection with pumping plants.

Standpipes placed upon the force mains are employed by several American cities, whose reservoirs are distant from their pumping stations to equalize the resistance against the pumps. Those at Louisville, Milwaukee and Saint Louis are examples. Other cities, such as Chicago and Toledo, where proper reservoir sites are unobtainable, use open-topped standpipes of considerable height, ranging from 150 to 275 feet. They serve as partial substitutes for relief valves acting in conjunction with tall air chambers. In the standpipes the surface of the water rises and falls according to the rate of delivery into them by the pumps and the rate of draft when the main over which they are placed is connected with the distributing system. In northern cities they have to be housed to prevent the water from freezing during the winter.

The water obtained by any of the methods already described is supplied to the consumers by distributing systems comprising the various kinds of mains, service pipes, house fixtures, valves and hydrants which control the flow and

WATER-WORKS

the delivery of the water, while various kinds of meters record the amount consumed and afford a basis for taxation. See **WATER METERS**.

Such systems often include distributing reservoirs, tanks, and standpipes, and sometimes auxiliary pumping plants. They usually consist of one or more trunk mains from which numerous branch pipes, continually diminishing in size, lead through under the surface of the streets and connect with the various buildings. The mains are usually of cast iron, although wooden pipes have been and are even at the present time used under certain conditions. Under a direct pressure system, when the water is pumped through such a pipe, it is called a force main. Originally they were of wrought iron, but proving unreliable were superseded by cast iron and finally by those of riveted steel. See **PIPES AND PIPE MANUFACTURE**.

The size of water mains depends upon the required volume and velocity of the water conveyed, and vary from 48 to 72 inches in diameter. Pipes leading to fire hydrants should not be less than four inches in diameter, and when of that size should be restricted to lengths not exceeding three or four hundred feet and leading to a single hydrant. Service pipes are usually of lead or wrought iron. Lead pipes, although more expensive, are preferable on account of their flexibility, smooth interior surface, great durability, and relative non-corrosiveness. Plain wrought-iron and galvanized-iron pipe corrodes so rapidly that it is unfit for use unless coated both inside and outside by asphaltum or varnish of some kind. Various substances have been applied for that purpose from time to time, while interior linings of cement have been used extensively; but the present practice is confined to the application of an asphaltum bath, with perhaps the most satisfactory results obtainable. It consists simply of a mixture of coal tar and asphaltum in proportions that will give a coating non-brittle at the freezing point.

Valves are employed to control the water as it flows into the mains and from them into the service pipes. Pipes are always liable to accident through excavations for buildings, sewers, electric conduits, overflows, and quicksand and clay slides. It is also very often necessary to shut off the water when new hydrants are attached, or when large pipe connections or repairs are made. Under such circumstances means to maintain a constant supply at and beyond the points involved are best obtained by a duplicate arrangement of sub-mains in parallel lines at several squares distance, joined across by a system of smaller service mains, so that there are always at least two lines of sub-mains around any given point. Under such conditions stop-valves may be used with advantage to shut off the water from a particular point without cutting off the supply from what may be a large territory lying beyond. Stop-valves are made in a great variety of forms, but the best have double self-adjusting disks, with the seats slightly divergent, so that the pressure of the screw sets the valve-disks snug upon the seats. They are usually located on the mains under some invariable system so that they may be readily found in case of accident when hidden by a cover of frozen earth, snow, or other debris. Blow-off and waste valves are attached to pipes laid upon undulating ground, and are used to

flush out the sediment deposited from unfiltered water, in the principal depressions of mains and sub-mains. Their diameters are usually about one half that of the mains from which they branch and they may be led into sewers or wherever the waste water may be disposed of. Valves commonly known as corporation cocks regulate the flow into the houses and are usually set near the curb. Check valves act against a backward flow of water and are useful on force mains to protect the meters against back pressure, while reducing valves are employed to relieve depressed areas of a city from excessive pressure where an effective division into high and low service is impracticable. They operate automatically, under the hydraulic pressure in the mains in which they are located, while the other forms are operated by hand or may be operated by electrical connections. Valves are expensive contrivances, and the cost of the larger sizes may be often reduced by the application of the Venturi principle, the larger pipes being gradually contracted to the size of a small valve, and then gradually increased to the original size without much loss of pressure.

Hydrants are valves used for fire-fighting and flushing purposes. In post or fire-hydrants, a vertical tube extends from the valve to a certain height above the ground. They are usually set on a branch pipe, at or near the curb line, and may be provided with from one to four nozzles, according to the capacity of the service mains, for the attachment of fire-hose. They are made in an innumerable variety of patterns; a first-class hydrant, however, consists of a frost case that is free to move up and down as the ground expands and contracts under varying temperatures, without straining the hydrant base; a waste valve that will drain the hydrant effectually as soon as the main valve is closed, and which will close automatically as soon as the main valve begins to open; a main valve that is positively tight, which if it closes "with" the pressure will be free of any slack motion of its stem and thus prevent a severe water-ram at the moment it is closed; a screw motion of the valves requiring at least ten complete revolutions before the valves are seated, thus insuring a slow closing and preventing the excessive shock and strain on the valves of an entire system that may result from a water-ram caused by the simultaneous closing of several hydrants. A stop-valve is usually placed between the main and the hydrant, so that the latter may be repaired without shutting off the flow through the mains. Hydrants should not be placed more than 500 feet apart, while in a closely built business district they may be placed at very close intervals.

Waste by leakage from the mains, and poorly constructed flushing devices, varies from 5 gallons upward per capita, and its reduction to a minimum is essential to the economical operation of any system of water-works, but it is especially important when the source of supply is distant and the purity of the water depends upon the conservation of its quantity. This can only be accomplished by careful workmanship in the construction of the plant; careful pipe laying; the use of high-grade, self-closing plumbing fixtures, especially those devices used for flushing water-closets, and the installation of meters not only to detect leaks and other causes of waste in the houses, but to form the basis for charges

WATER WORSHIP—WATERBURY

against the consumer and compel carefulness on his part. This, however, brings the matter to a point where it is necessary to harmonize good practice with public policy. The details of district meter systems, and the inspection of service pipes are minor problems as compared with the equitable adjustment of water rates according to the various classes of consumers. In general, although the district plan is but a poor competitor of the house meter system, it has produced good results in controlling waste and detecting leaks whenever it has been employed, and is worthy of more careful consideration, and extensive application in the various water-works systems throughout the United States.

Consulting Civil Engineer.

Water Worship, a feature of nature worship, and one of the primitive superstitions of mankind. Water was not worshipped as an element, but in its various forms of well and spring river and ocean. Every spring and river was supposed to have an animating deity, who could be propitiated or offended, and the worship of these divinities was a prominent part of Greek and Roman cult, especially in the rural districts.

Waterboro, wă'tér-bûr-ô, Maine, town in York County; on the Portland & Rochester Railroad; about 25 miles southwest of Portland. It contains the villages of Waterboro, East Waterboro, South Waterboro, North Waterboro, Waterboro Centre, and Ossipee Mills. It was settled in 1787, and in 1789 was incorporated. The town has flour and lumber mills, an apiary for breeding bees, and considerable dairy interests. Pop. (1890) 1,357; (1900) 1,169.

Waterbury, a city of Connecticut, in New Haven county, the fourth in population in the State, and one of the most important manufacturing centres in New England. It is situated on both sides of the Naugatuck River, 21 miles above its junction with the Housatonic, 22 miles northwest of New Haven and 32 southwest of Hartford. In January, 1902, by an amendment to the charter, the city became co-terminous with the town, so that it now covers an area seven or eight miles square. Its physical features are greatly diversified. Its streams and wet lands probably suggested its name, given to the town at the time of its incorporation. Its earliest designation, "Matetacoke" (shortened to Mattatuck), means a place or land without trees, and had reference probably to the primeval meadows on the Naugatuck.

History.—The first attempt at a settlement was made in 1674, by men of Farmington, on the high land west of the river, known ever since as

the Town Plot. The breaking out of King Philip's war led to the abandonment of this site, and the planters, when they returned, settled on the east side of the river, nearer to Farmington, calling the place the Town Spot. The settlement was formed under the order of the General Court, upon the payment of about £2,500. The men numbered 31, and for 26 years no outsider was admitted as a proprietor. Mattatuck was incorporated as a town (of Hartford county), with a change of the name to Waterbury, in 1686, occupying then a territory about eight miles wide and 18 miles from north to south.

For more than a century its growth was slow. In addition to the natural disadvantages of the situation, there were such disasters as the "great flood" of 1691 and the "great sickness" of 1712. The organization of a church—always an important event in a New England plantation—did not take place until 1691. The town and parish were identical until 1738, when Westbury (now Watertown) was set apart as an ecclesiastical society. Northbury (now Plymouth and Thomaston) secured similar rights in 1739, and thenceforth the original parish became known as the First Society. The church belonged, of course, to the Congregational denomination. No other existed in the territory until 1737, when Episcopal services were introduced. The town was represented in the Revolutionary War by about 800 men, an extraordinary number.

Throughout its history, Waterbury has suffered seriously from fires. The losses in 1880-81 and in 1892-94 were exceptionally large, but were far surpassed by those of the great fire of 1902, which amounted to more than \$2,000,000. A fire company was organized in 1828 and several others later, and a fire department was established under the first city charter in 1854. This has developed, much after the fashion of other cities, into a paid department, with a chief engineer, and with steam fire-engines drawn by horses.

Manufactures, etc.—The conditions that surrounded the settlement of the town and limited its agricultural prosperity became an important factor in its subsequent development. Under the discipline of poverty and hardship, a group of men grew up who possessed inventive genius, and, in addition, patience, economy, and pluck. When the manufacturing era opened, these men were at the front, ready to make use of their opportunities, while the rapid streams of the region furnished the necessary water-power. The farmers' sons became manufacturers—makers of clocks and buttons—and along the several streams little factories and mills grew up, whose products met the growing demand of the time. It was in response to this demand, emphasized by the War of 1812-15, that the brass industry of Waterbury received its early impetus—an impetus which was enhanced anew, and very greatly, by the war for the Union. By 1840 the manufacture of sheet metal and wire had taken the lead of all others. But there were many uses to which sheet brass could be applied beside button-making, and Waterbury manufacturers were quick to discover them. The great manufacturing factories are still known locally as "rolling mills," but the articles produced in them are of endless variety. Through the latter half of the 19th century the bulk of the brass manufacture was carried on by six concerns, one of which came into existence in 1802, and an-

WATERBURY

other a few years later. These six manufactories still hold (in 1904) their prominent position, but meanwhile others have sprung up and attained to great importance, some devoted to one specialty and some to another, and several of them rivaling in the extent of their product the older establishments. Buttons, buckles, pins, hooks and eyes, suspenders, harness trimmings, rivets, wire, tubing, gas fixtures, lamps, brass kettles, boilers, clocks, watches, spoons, forks, flasks, percussion caps, photographic materials, coins for South American republics—things of all kinds made wholly or in part of brass—are sent forth from their packing rooms by hundreds of thousands, and shipped to all parts of the world. The chief seat of the brass industry in America is the Naugatuck Valley, and Waterbury is its dominant centre. There are also important establishments quite outside of the brass industry—machine shops of national reputation, foundries, manufactories of cutlery, of hinges, of traps, of aluminum goods, paper-box factories, and various others. The number of Waterbury concerns which organized under the "Joint-Stock Law" of Connecticut between 1843 and 1895 was about 250. One hundred of these were companies working in metals; the rest were corporations manufacturing other materials, or mercantile and miscellaneous concerns. Many of these have ceased to exist, but the surviving corporations number considerably more than 100. In 1845 the capital employed in manufactures amounted to \$653,825; in 1890, the amount of the capital was \$17,682,500, and the value of the product, \$17,712,829; and, in 1900, the amount of the capital was \$23,421,640, the value of the product \$33,778,905, and the total of wages paid, \$7,564,198. Through all this period Waterbury men were busy as inventors. The first United States patent was granted to a descendant of a Waterbury miller; the second was granted to a resident of Waterbury—in 1706. The patents granted to 422 Waterbury inventors between 1808 and 1890 numbered 1,250. The number of patents issued up to 1890, in proportion to the number of the inhabitants, was as 1 to 405, while the proportion of Connecticut patents to the population of the State was as 1 to 796. As the ratio in Connecticut is higher than anywhere else except in the District of Columbia, to which inventors naturally flock, it is evident that at the time referred to Waterbury took the lead of all other communities in inventive skill; and very possibly she still retains it. The city has eight banks, including two savings banks.

Railroads and Transportation.—Electric cars run through the main streets and beyond the city limits to Oakville, Cheshire, and Naugatuck. The Naugatuck division and the Highland division of the New York, New Haven & Hartford Railroad intersect at Waterbury, and there are branches extending to Middletown through Cheshire and Meriden, to New Haven, and to Watertown. There are stage lines, as of old, to Naugatuck, Middlebury, and Woodbury; also the usual local and national express companies, and the usual telegraph and telephone facilities and a messenger service. The product of the Waterbury manufactories in the line of mailable goods is so immense that the business of the post-office is exceptionally large. The receipts for 1903 were \$95,085, and for the first half of 1904 \$49,353, exclusive of money orders. The money

order business amounts to more than a half million dollars annually.

Water Supply, Lighting, etc.—The water supply is abundant and good. A reservoir was established on East Mountain in 1868, another on Cooke street in 1880, and in 1893 the building of the Wigwam Reservoir, on the west branch of the Naugatuck, 11 miles north of the city, was begun. There are 61 miles of water pipe, and the daily average of water used in 1903 was 6,329,083 gallons. A sewerage system was introduced in 1883, but the discharge of sewage into the river was strongly objected to by persons and establishments located below the outfalls. Injunctions were served upon the city, which have been sustained by the Supreme Court, so that Waterbury finds itself face to face with an unusually difficult problem of sewage disposal. In August, 1904, it began the building of a trunk sewer, with outfall some miles down the valley. The city has been lighted by gas since 1854. Electric lights were introduced in 1884, and were substituted for gas lights on the public streets not long after. Since 1904, the current which supplies the lights and also furnishes the motive power of the trolley system, is brought across the country from the Housatonic River.

Streets, Parks, Buildings, etc.—The city is divided into four sections, as the town has been from its settlement, by two main streets, one running east and west, the other nearly north and south. There is also an informal division into districts, some of which represent the school districts of the earlier time. The most important of these are Brooklyn, Waterville, and Hopeville. At the intersection of the main streets there is a central park or green, adorned with stately elms, at one end of which stands an elaborate soldiers' monument (erected in 1885, by popular subscription), and at the other end a handsome drinking fountain. The development of Hamilton Park—a valuable gift to the city—was begun in 1903. The public buildings worthy of mention are the city hall, the courthouse, the post-office, the Bronson Library, the Second Congregational Church, Saint John's Church (Episcopal), Saint Patrick's Church (Roman Catholic), the building of the Young Men's Christian Association, the Girls' Industrial School, the Odd Fellows' building, the Citizens' Bank, the Elton Hotel, and the office of the Colonial Trust Company.

Education, etc.—School affairs were at first conducted by the town, and afterward by a "school society," which divided the town into fourteen districts. In 1849, chiefly with a view to establishing a high school (the old academy having suffered a decline), five of the districts were incorporated as a Centre district, under the management of a Board of Education, a Finance Committee, and a Superintendent of Schools,—leaving a circle of outlying districts under the old management (a Board of School Visitors). In 1899 the bounds of the city were extended and made co-terminous with those of the Centre district, and the earlier and somewhat cumbersome organization was superseded by a Department of Education, consisting of the Mayor and a board of seven members. When, in 1902, the city was finally made co-terminous with the town, the traditional status of the outlying districts was preserved. The Superintendent of Schools reported in 1903: Population (estimated), 65,000; children (enumerated), 14,883; enrolled in the public schools, 8,812; buildings, 31; school-

WATERBURY — WATERCOURSES

rooms, 217; teachers, 219; expenditures for 1903, \$285,000. Kindergartens have been established in several schools, and evening schools have been conducted, intermittently, since 1856. Corporal punishment has not yet been abandoned. The first high-school building was destroyed by fire in 1870; the third was erected in 1895-96, at a cost of \$100,000. Pupils enrolled in other than public schools in 1903 numbered 2,900. These other schools include Saint Margaret's School for Girls (the Diocesan School of the Episcopal Church), the Academy of the Convent of Notre Dame, Saint Mary's parochial school and convent, and various smaller schools. In the 'Waterbury History' (1895) the town is credited with 421 college graduates. The Bronson Library, founded in 1868 by a bequest of \$200,000 from a native of the town, contains more than 60,000 volumes, and has a circulation of about 8,000 per month. The present building was erected in 1893-94, at a cost of \$63,500, and the fund now amounts to \$245,000. There are three daily newspapers — the *Waterbury American*, established 1844; the *Waterbury Democrat*, and the *Waterbury Republican*, both dating from 1881. The town has made a very respectable record in pictorial art, sculpture, music, and literature.

Societies.— Various literary, musical, and scientific societies and social clubs have been organized, the most active of which (in 1904) are the Waterbury Club, incorporated in 1881; the Women's Club, established in 1889; the Daughters of the American Revolution (1893), the Naturalists' Club (1897), and the Mattatuck Historical Society, organized in 1877 and incorporated in 1902. A Masonic lodge was opened in 1707, and an Odd Fellows' lodge in 1845. The various Masonic bodies and mutual benefit fraternities number more than 175. The National Guard of Connecticut is represented by Companies A and G of the Second Regiment, for whose use an armory was built in 1883. The Young Men's Christian Association, organized in 1858, occupies a building which cost \$40,000. Other philanthropic organizations are the Industrial School (for girls), the Boys' Club, the Young Women's Friendly League, two day nurseries, a free kindergarten, Protestant and Roman Catholic temperance societies, and the Southmayd Home (for aged persons). The Waterbury Hospital was established in 1884, largely by popular subscription. The present almshouse was built in 1893, at a cost of \$80,000. Of the several cemeteries of the town, Riverside (opened in 1853) is noteworthy for its picturesqueness and for its monuments. A memorial chapel stands at its main entrance.

Religion.— Waterbury contains 30 churches and three Union chapels. Probably two-thirds of the population are Roman Catholics, and the Catholic churches number 11. Three of the Protestant churches are Congregational, three Episcopalian, five Baptist, five Methodist, two Lutheran, and one Adventist. There is also a corps of the Salvation Army, a society of Christian Scientists, and a Jewish synagogue.

Government.— In 1825 the population lying around the centre of the town was organized into a borough. The incorporation of the city took place in 1853, with a population of about 4,000. A new charter, obtained in 1871, was superseded by another in 1896, to which important amendments were made in 1899 and 1902. Under this third charter the city is divided into five wards, and the government is conducted by a

mayor and 15 aldermen, through a number of boards, each having charge of one of the following departments: Of Public Works, of Public Safety, including the police and fire departments, of Public Health, of Charities, of Education, of Finance; also a Board of Assessors, a Board of Relief, and a Board of Agents of the Bronson Library. There are also superintendents of streets, of the water works and of sewers, and a city engineer. Besides the Police Court, there is a District Court, which has jurisdiction beyond the limits of the city, and sessions of the Superior Court are held in Waterbury.

Population.— The successful conduct of manufactures so extensive and varied in an inland Connecticut valley has involved a large and steadily increasing immigration. The growth of the city since 1850 has been greatly augmented by the steady inflow of foreigners. The population in 1790 numbered 2,037; in 1850, 5,137; in 1860, 10,004; in 1880, 17,806; in 1890, 28,646; in 1900, 51,139. In 1904, a conservative estimate makes it over 60,000. The percentage of residents of foreign birth or parentage is, with one exception, the largest of any Connecticut town, and the number of nationalities represented is remarkable. At the same time, the condition of the community, socially and morally, is exceptionally good. Waterbury is noted for the superior grade of the homes of its working people. Strikes have occurred very rarely — never in the large manufactories — and, although the saloons number 175, there is but little intemperance or other visible crime. Wealth is more uniformly distributed than in most cities, the question frequently arising whether there are any millionaires in the community. The valuation of property in the grand list of 1903 was \$114,358,117.

Bibliography.— Bronson, 'History of Waterbury' (1858); Basse, 'Waterbury and Her Industries' (1888); Anderson, 'The Town and City of Waterbury from the Aboriginal Period to the Year 1895' (1896); also 'Charter and Ordinances of the City of Waterbury' (1902), and the annual 'Municipal Register.'

JOSEPH ANDERSON.

Waterbury. Vt., town in Washington County; on the Waterbury River, and on the Central Vermont Railroad; about 11 miles northwest of Montpelier. It contains the villages of Waterbury and Waterbury Center. The location, in a beautiful valley, is most picturesque. The principal manufacturing establishments are grist and lumber mills, brick works, tannery, boot and shoe factory, sleigh and carriage works. There are six churches, Green Mountain Seminary, and graded schools. The national bank has a capital of \$100,000. Pop. (1890) 2,232; (1900) 2,810.

Watercourses, in law, streams of water usually following a well-defined channel and emptying into some other body of water. A watercourse need not maintain a constant current, and does not, therefore, lose its distinctive character if it become dry at a time of excessive drought. But it must be more than an occasional stream, the result of unusual rains or the melting of snow, and following a channel customarily dry. Percolating waters, surface waters, and occasional streams are not subject to property rights. The owner of a watercourse has, within certain defined limits, the right to hold it unimpaired by others above or below. See RIPARIAN RIGHTS; WATER RIGHTS.

WATEREE — WATERLAND

Waterree, a river of South Carolina, formed by the junction of the Catawba River and Fishing Creek, and is called the Catawba in the upper part of its course. It runs nearly southward, forms the east boundary of Chester, Fairfield, and Richland counties, and unites with the Congaree River at the southwest extremity of Sumter County to form the Santee River.

Waterfall, a sudden descent in the water of a river or stream from a higher to a lower level. When the water falls over a precipice it is called a cataract, and when several cataracts occur in succession it is called a cascade. Some of the mountain waterfalls are remarkable for their height, while others are noted for the fall of immense quantities of water. The most remarkable waterfall in the world is Niagara Falls on the Niagara River, between Lakes Erie and Ontario, and thousands of visitors from all parts of the world have admired the sublimity of these falls. Waterfalls are now being utilized to furnish both electric and water power for commercial purposes. The falls discovered by Dr. Livingston in Africa and named by him Victoria Falls, the falls of the Rjukanfoss in Norway, the Cascade of Gavarnie in the Pyrenees, and the falls of the Rhine are among the most beautiful in the world, and justly celebrated. For a fuller description see CATARACTS.

Waterford, Ireland, a maritime county in the province of Munster, bounded on the north by Counties Tipperary and Kilkenny, on the east by County Wexford, on the west by County Cork, and on the south by the Atlantic. It has an area of 717 square miles. The coast is bold and rocky, but has several good harbors. The surface is generally mountainous and there are many marshes. Agriculture is carried on to a limited extent only. In 1901 the total extent of lands under crops was 53,745 acres; including meadow and clover, 78,373 acres. Bacon and butter are the chief exports. There are some minerals in the county, but little is done in the way of mining. Some limestone and marble are quarried. The fisheries on the coast give employment to several hundred men. The chief towns in the county are Waterford, Dungraven, and Tramore. The county is divided into two parliamentary divisions, East and West, and had a population in 1901 of 87,187.

Wa'terford, Ireland, capital of County Waterford, and a county city; on the right bank of the Suir, connected with its north suburb of Ferrybank, by a bridge. Of six Catholic places of worship, including a cathedral, the finest is the Dominican Church of Saint Savior, erected (1878) in the Italian style; the Protestant Episcopalians have also a cathedral and two churches. Other buildings are the Protestant Episcopal palace, the Catholic College of Saint John, Saint Dominic's Industrial School, four convents, a town hall, market house, etc. Considerable sums have been expended in deepening the channel of the Suir, whose south bank is fringed for a mile by a spacious quay, while on the Kilkenny side is a shipbuilding yard, with a patent slip, graving bank, and dock. Besides two immense bacon-curing establishments, Waterford has iron foundries, flour mills, breweries, etc. A memorial of Waterford's foundation by the Danes in the 9th century is "Reginald's Tower" (1003), which has witnessed the city's capture by Strongbow (1170), the repulse of Cromwell and surrender of Ireton (1649-50),

and the embarkation of James II. after the battle of the Boyne (1690). Pop. (1901) 26,743.

Waterford, N. Y., village in Saratoga County; on the Hudson River at the mouth of the Mohawk River, and on the Champlain Canal and the Delaware & Hudson Railroad; 2 miles above Cohoes and 10 miles north of Albany. It has extensive water-power, and is a manufacturing village. The chief manufactures are knitting mills, foundry and machine shops, fire-engine shops, paper and flour mills, boiler works, and a furniture factory. In 1900 (government census) there were 58 manufacturing establishments, capitalized for \$2,593,021. The raw material used annually cost \$1,544,719, and the value of the finished products was \$2,966,060. It has a Union Free School, public and parish elementary schools, and a free library. There is one private bank. Pop. (1890) 5,286; (1900) 6,157, including town.

Wa'terhouse, Alfred, English architect: b. Liverpool 19 July 1830, studied architecture under Richard Lane in Manchester, and afterward in France and Italy. He began practice in Manchester in 1853, and first made his name known by the Assize Courts of that city. For the same city he has since designed the County Jail, Owens College, the Town Hall, Saint Mary's Hospital, and other buildings. In other parts of England he has been responsible for the following among other buildings: in Liverpool, Seaman's Orphanage, Turner Memorial Home, Royal Infirmary, and University College; in London, Natural History Museum, New Saint Paul's School, City and Guilds Central Institution, King's Weigh House Chapel, and University College Hospital; in Oxford, Balliol College (partly rebuilt); in Cambridge, Caius and Pembroke colleges (partly rebuilt); in Leeds, Yorkshire College; the mansions of Eaton Hall (Cheshire), Heythrop (Oxford), and Iwerne Minster (Dorset). He was elected A.R.A. in 1878, and R.A. in 1885, and in 1898 became treasurer of the Academy. He received a Grand Prix from the Paris exhibition of 1867, and is a member of various foreign academies. In 1878 he was awarded the gold medal of the Royal Institute of British Architects, of which he was president 1888-90.

Waterhouse, John William, English painter: b. Rome, Italy, 1840. He studied at the Royal Academy and his paintings are noted for the richness of their coloring. His paintings include: 'The Oracle' (1884); 'The Magic Circle,' 'The Lady of Shalott,' and 'La Belle Dame sans Merci.'

Wa'terland, Daniel, English clergyman: b. Lincolnshire 14 Feb. 1687; d. 23 Dec. 1710. He studied at Cambridge, became master of Magdalen College, chaplain to George I., and canon of Windsor. Waterland was an able defender of the Orthodox faith against the Deists. His chief writings are: 'A Vindication of Christ's Divinity, being a Defence of some Queries relating to Dr. Clarke's Scheme of the Holy Trinity' (1719), followed by a second (1723) and third (1725) 'Vindication'; a 'Critical History of the Athanasian Creed' (1724), also directed against Clarke; 'Christianity Vindicated Against Infidelity,' a reply to Tindal's 'Christianity as old as the Creation'; and a 'Review of the Doctrine of the Eucharist' (1737), directed against Hoadley's rationalistic theory of that ordinance. Consult: Van Mildert, 'Life of Daniel Waterland'

WATERLINE—WATERLOO

prefixed to Waterland's 'Works,' in 6 vols. (1843).

Waterline, in shipbuilding, the boundary of any section of the bottom of a ship made by a plane parallel to the line of flotation. The uppermost one is called the load water line; the lowest the light water line.

Waterloo, Stanley, American author and journalist: b. Saint Clair County, Mich., 21 May 1846. He was graduated from the University of Michigan in 1869, engaged in journalism, was one of the owners of the *Saint Louis Journal* in 1872, was subsequently editor of the *Saint Louis Republic*, *Chronicle*, and *Globe-Democrat*, and in 1884 established the *Saint Paul Day*. He was later editor-in-chief of the *Chicago Mail*, and has been engaged on various other journals. He has written: 'A Man and a Woman' (1892); 'Honest Money' (1895); 'These are My Jewels' (1902), etc.

Waterloo, Canada, (1) A town of Waterloo County, Ontario, two miles northwest of the capital, Berlin, on a tributary of the Grand River, and on a branch line of the Grand Trunk Railway to Elmira. It is an industrial centre, with iron foundries, manufactures of agricultural implements, textiles and tobacco, breweries, and distilleries. Pop. (1901) 3,537. (2) The capital of Shefford County, Quebec, and a railway junction, on the Stanstead, Shefford & Chambly Railway, 70 miles east by south of Montreal. It has lumber and flour mills, a brewery, tanneries, and manufactures of mill-machinery, agricultural implements, iron castings, and furniture. Pop. (1901) 1,797.

Waterloo, England, a town and watering-place of England, on the Lancashire coast, four miles north-northwest of Liverpool, forming with Seaforth one urban district. Pop. (1901) 23,101.

Waterloo, Ill., city, county-seat of Monroe County; on the Mobile & Ohio Railroad; about 20 miles south of Saint Louis, Mo. It is in a fertile agricultural region, in which the chief products are wheat and corn. In the vicinity are quarries of fine building stone, known in the trade as Waterloo marble. The chief manufacturing establishments are flour mills, marble works, a large brewery, an ice factory, and bottling works. There are large stock yards and coal and lumber yards. The educational institutions are a high school, founded in 1891, Saint Joseph's School (R. C.), public and parish elementary schools, and a school library. The two banks have a combined capital of \$35,000, and deposits amounting to \$253,930. Pop. (1890) 1,860; (1900) 2,114.

Waterloo, Ind., town in De Kalb County; on the Cedar Creek, and on the Lake Shore & Michigan Southern Railroad; about 25 miles north of Fort Wayne. It is the commercial centre of an extensive agricultural section, in which wheat, corn, and vegetables are the chief products. It has seven churches, a high school, founded in 1872, graded elementary schools, and two banks. It was founded in 1857, and in 1864 was incorporated. Pop. (1900) 2,114.

Waterloo, Iowa, city, county-seat of Blackhawk County; on the Cedar River, and on the Illinois Central, the Chicago, Rock Island & Pacific, and the Chicago, Great Western R.R.'s; about 95 miles west of Dubuque. It is in an ag-

ricultural and stock-raising region, and has considerable manufacturing interests. The chief manufacturing establishments are foundries, machine shops, gas-engine works, thrashing-machine factories, and automobile works, and manufactories of refrigerators, manure spreader, and egg cases. The government census of 1900 gives the number of manufacturing establishments as 147, which were capitalized for \$1,287,056. There were employed as wage earners 1,042, to whom were paid \$471,608. The raw material used cost \$1,555,578, and the annual products were valued at \$2,499,361. The manufacturing industries had increased from 1900 to 1903, so that in December of the latter year there were 2,726 employees. The principal public buildings are the government building, the county court-house, municipal buildings, and the Presbyterian Hospital. There are 31 church buildings. The educational institutions are two public high schools; the East High School, founded in 1872, and the West High School, in 1870; Our Lady of Victory Academy (R. C.), public and parish elementary schools, Waterloo Business College, and school libraries. The seven banks have a combined capital of \$4,188,103 (December 1903). The government is vested in a mayor and a council of eight members elected biennially. The majority of the inhabitants are American born; of the foreign born the Germans predominate, then the Irish, and the Scandinavians. Waterloo was settled in 1845-6 by G. W. Hanna and Charles Mullan. It was incorporated as a town in 1868. Pop. (1890) 6,674; (1900) 12,580; (1903) est., U. S. Dept. of Commerce and Labor, 15,034.

Editor 'Courier.'

Waterloo, N. Y., village, one of the county-seats of Seneca County; on the Seneca River, the Cayuga & Seneca Canal, and on the New York Central & Hudson River Railroad; about 18 miles west of Auburn and 55 miles east of Rochester. It is in an agricultural region, but the village has several manufactories, chief of which are large woolen mills, lumber mills, piano factories, wagon and carriage works. It has a high school founded in 1843, public elementary schools, and a public library. The two banks have a capital of \$125,000, and deposits amounting to \$434,270. Pop. (1890) 4,350; (1900) 4,256.

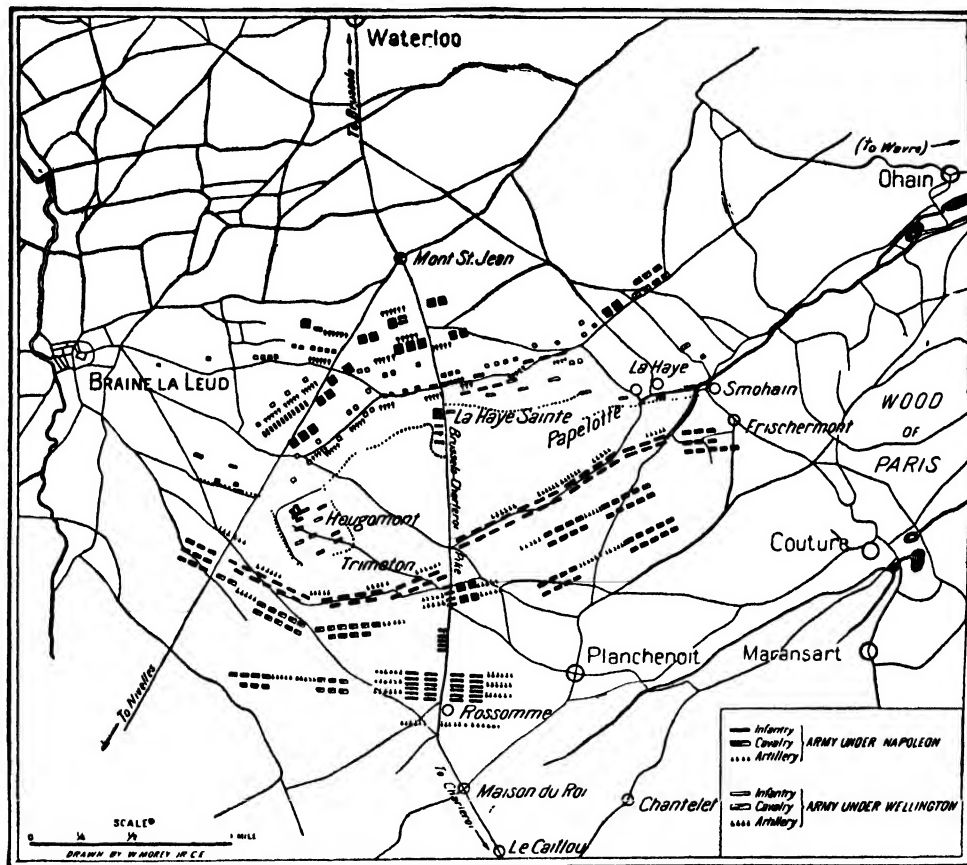

Waterloo, Battle of, the culminating engagement of the shortest and most decisive of all of the Napoleonic campaigns, was fought 18 June 1815, near the village of Waterloo, in Belgium, situated about 12 miles south of Brussels. From 11 April 1814, when Napoleon signed the first abdication and retired in exile to Elba, until 20 March, when he terminated the period of that retirement and returned to Paris, the political and domestic affairs of France had been bordering on revolution. Although the administration of affairs by the government established by the Comte du Provence, who, under the title of Louis XVIII., had taken unopposed possession of the country, restored political liberty, the changes inaugurated were so sudden, that it unsettled all domestic affairs, the title of estates, the position of public men, and the prospects of the army to an intolerable extent. A general sense of alarm and humiliation prevailed among all classes, and even a Napoleonic period seemed preferable to the existing conditions. To add to the general turmoil, about 300,000 troops who

WATERLOO

had been held as prisoners in the various German fortresses were released under treaty stipulations and returned to France. Their apparent availability for further operations soon formed the basis for innumerable military plots of which that designed by Fouché, with the ultimate object of placing either the Duke of Orleans or the King of Rome upon the throne, was the most important.

Napoleon was fully conscious of the existing state of affairs. France was down, groveling at the feet of the Allies. Here was the opportunity for a truly patriotic action. He would give popular liberty to imperial France, and

dred Days with professions of peace and liberty, the Allied Powers suspended negotiations at the Congress at Vienna, issued a declaration branding him as "an enemy and disturber of the peace of the world," and formed a new Coalition to renew the struggle against him. By the beginning of June they had more than 700,000 men in the field, and he was compelled to take active measures to defend his newly recovered empire. The French army amounted to about 500,000 men, on paper, but only about 200,000 men were available for actual field service. In planning the campaign, Napoleon had the choice of confining himself to purely defensive operations and

Field of Waterloo. (Showing positions of the two armies at 11 a. m., 18 June 1815.)

henceforth devote all his energies to strengthen that liberty and increase that prosperity. He counted upon the enthusiastic support of the army which was fretting under the command of emigres who had once fought against France, but were then being appointed to important commands, and felt sure of the effect of his tremendous military fame upon the general military feeling of the country. He thought of Marengo; how in three short months he had lifted France and himself from the lowest ebb of fortune up to the highest pinnacle of military glory and power. He judged correctly in all these things. He left Elba 20 February, and landed on the coast of France 1 March, and entered Paris triumphantly 20 days later.

While Napoleon was inaugurating the Hun-

allow the Allies to invade France, or of assuming the offensive, and relieve her of the consequences of a second invasion. He chose the latter, and laid the scene of the campaign in Belgium where the English under the Duke of Wellington had their headquarters at Brussels, and the Prussians under the command of Marshal Blücher, at Namur.

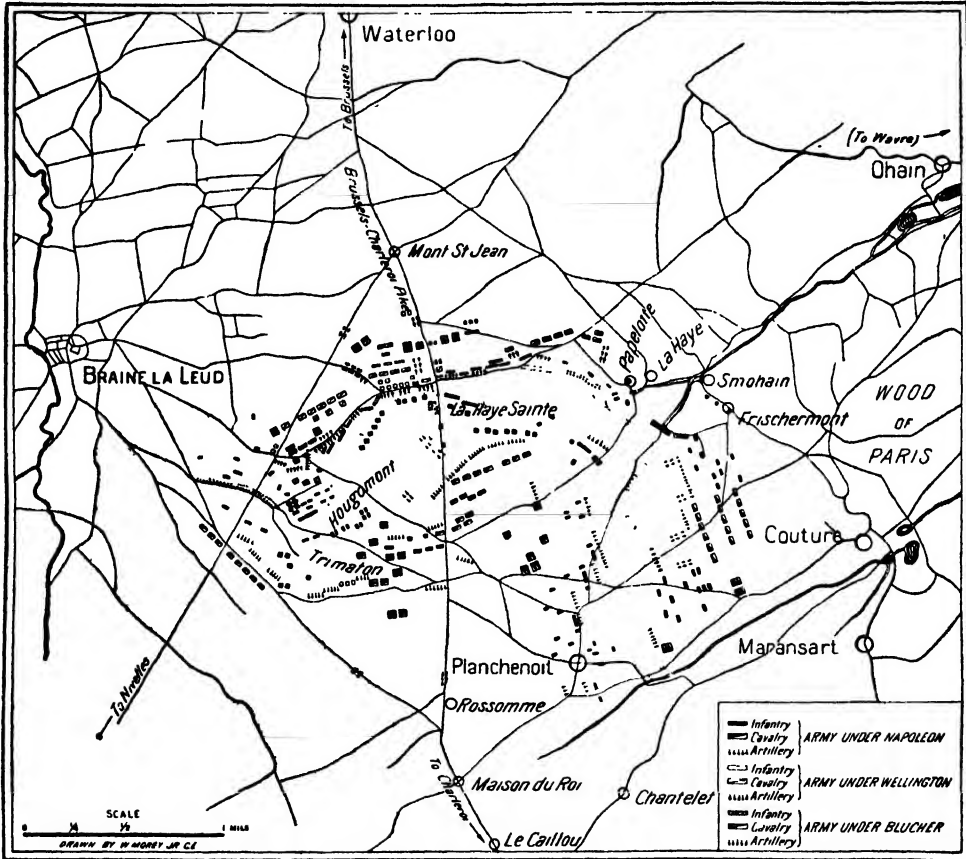

The general plan of operations was based upon his favorite form of strategy—action on "interior lines" against the two armies opposed to him. He assumed that Wellington and Blücher would endeavor to form a junction at Charleroi, and determined to concentrate the bulk of his own army at that point and defeat them separately before they could effect that junction, and then turn his attention to the force

WATERLOO

of Austrians and Russians gathering on the eastern border under the command of Prince Schwarzenberg.

At the beginning of the campaign the French army numbered 124,588 men—89,415 infantry, 23,595 cavalry, 11,578 artillery with 344 guns. Wellington commanded 93,717 men—69,829 infantry, 11,879 cavalry, 9,406 artillery and engineers, with 196 guns. The Prussian forces under Blücher amounted to 120,954 men—99,715 infantry, 11,897 cavalry, and 9,360 artillery, with 312 guns. Wellington's forces, composed of Englishmen, Dutch, Belgians, Nassauers, Germans, and Brunswickers, were stationed in numerous cantonments scattered over a large area

noon of the 16th, and after several hours of hard fighting were driven back upon Frasnès. In the meantime, with the intention of blocking the road between Quatre-Bras and Sombrefe so as to separate the forces under Wellington and Blücher, the troops commanded by Napoleon himself, attacked the Prussians at Ligny, and after three hours of severe fighting, defeated them and captured 21 guns. The battle was desperate and bloody; about 12,000 Prussians fell, and in the final charge of the Guard, Blücher himself was wounded. This was Napoleon's last victory. As the result of the battle, he assumed that the Prussians had been routed and were retreating to their base by way of

Field of Waterloo. (Showing positions of the three armies at 7:30 p. m., 18 June 1815.)

around Brussels, and to the westward of the Brussels-Charleroi pike leading to the south, with the coast as their base. Of Blücher's force, the First corps, under Ziethen, was at Charleroi, the Second, under Pirch, at Namur, the Third, under Thielmann, at Ciney, and the Fourth, under Bulow, at Liège, with the Rhine as their base.

The movement began on 13 June. The French army advanced rapidly northward, crossed the Sambre on the afternoon of the 15th, attacked Ziethen's position, drove him back upon Fleurus, and occupied Charleroi. A portion of the army then continued the advance through Gossillies to Quatre-Bras where they met a force of 25,000 men under Wellington, on the after-

Namur and Liège, when, as a matter of fact, under the direction of Gneisenau, Blücher's chief of staff, they were moving northward and converging on Wavre, with the intention of joining Wellington, with whom they were in constant communication. About noon of the 17th, Napoleon detached Grouchy with 33,000 men to pursue and complete the defeat of the Prussians driven back at Ligny, while he himself with the main body of the army joined Ney and followed Wellington, who, although victorious at Quatre-Bras, had been forced to fall back northward toward Brussels on account of the defeat of the Prussians at Ligny. Wellington's retrograde movement was continued during the whole of the 17th, until he had reached the heights of Mont

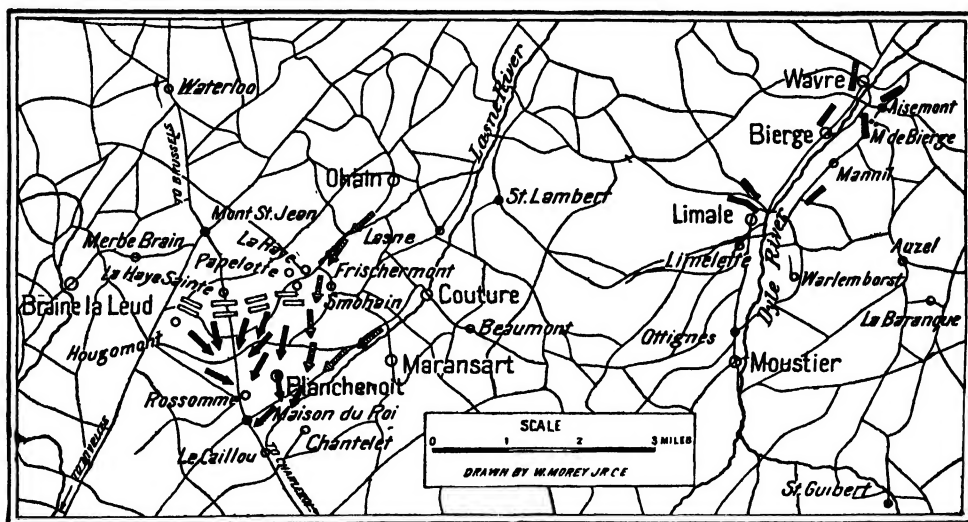

WATERLOO

Saint Jean, about four miles south of the village of Waterloo, where the Prussians could join him by way of Ohain and Wavre. Here he selected his position, and confident of their assured support, he awaited the advance of the emperor.

On the afternoon of the 17th, when Napoleon reached Marbain, he received the information that the Prussians defeated at Ligny had not retreated to Namur and Liège, and he sent a message to Grouchy informing him of that fact, and instructing him to find out if the Prussians were moving to a junction with Wellington. When Grouchy received this message he was actually farther from the Prussians than the Prussians were from Wellington, and about the time he reached Gembloux, about 10 o'clock on the night of the 17th, only to learn that the Prussians had really marched to Wavre, the main French army had reached the field of Waterloo and bivouacked opposite the forces of Wellington. It was past midnight when Napoleon inspected the position of both armies. The main

on the Charleroi pike directly in the rear of Wellington's position and thus cut off his retreat in the direction of Brussels and his base of supplies. The best authorities concede that the plan was admirably conceived.

About 8 o'clock on the morning of the 18th, Wellington drew up his forces in line of battle, but although the rain which had been falling all night ceased about that time, the attack by the French was postponed so that the ground might be in better condition for artillery movements. A little before 9 o'clock Napoleon reviewed his lines, and about 10 o'clock he sent instructions to Grouchy to advance upon the Prussians at Wavre. The battle commenced at 11.30. As a diversion, a division of Reille's corps assaulted the British position at Hougomont, were repulsed, and were supported by division after division until the entire Second corps were in action against Wellington's left, and therefore did not take any part in the main attack on the British centre by D'Erlon about 1.30. In this attack, the advanced troops of the British right,

General Map. (Showing positions of the three armies at 8 p. m., 18 June 1815.)

line of Wellington's forces occupied an advantageous position along the highway that runs from Braine la Leud to Wavre by way of Ohain, with the centre resting on the Brussels-Charleroi pike, while strong outposts held the farm house of La Haye Sainte directly in advance of the centre, the hamlets of La Haye, Papellote, and Smohain on the extreme left, and the chateau of Hougomont on the right. His force consisted of 67,661 men—49,608 infantry, 12,408 cavalry, and 5,645 artillery with 156 guns. Of these the British troops numbered only about 24,000. Napoleon had 71,947 men—48,950 infantry, 15,765 cavalry, and 7,232 artillery with 246 guns. He arranged his troops in two lines diagonally across the Brussels-Charleroi pike, the right resting on Frischermont, and the left across the road to Nivelles, with a strong force of infantry, cavalry, and artillery stationed in the rear on both sides of the Charleroi pike near Rossomme.

Early on the morning of the 18th, he dictated his plan of battle the direct object of which was to capture the village of Mont Saint Jean lying

composed of Bylandt's brigade, were easily routed, but the advancing French received a terrific fire from Picton's brigade, and being charged by the British cavalry, fell back in great disorder. Here General Picton who probably commanded the British right was killed. In the meantime, assault upon assault was made by the French on La Haye Sainte, which occupied the greater part of the afternoon, while for two hours, from 4 to 6 o'clock, under the personal direction of Ney, the splendid cavalry divisions of the French were hurled against the British right-centre, but failed to break the formation of a single British square. The cavalry attack being unsupported by infantry, Ney was compelled to withdraw for lack of troops, about 6.30, just as La Haye Sainte was taken, too late, however, to be of any advantage. About the middle of the afternoon Napoleon discovered the advance guard of the re-enforcing Prussians on the hills of Saint Lambert about three miles away upon his right, and realized for the first time that the entire Prussian force had succeeded in concentrating at Wavre, and were now on hand

WATERMAN—WATERS

to aid Wellington. He immediately detached Lobau with the Sixth corps, to intercept the new enemy, and sent a message to Grouchy, ordering him to return. Grouchy in the meantime, having moved off to Wavre in search of the Prussians, did not get this message until evening.

Lobau being unable to check the advance of the Prussians, the Young Guard was sent to reinforce him, and then, believing that his right was secure, Napoleon massed the eight remaining battalions of the Imperial Guard for a final attack upon Wellington's centre. Supported by a terrific artillery fire, and led by Friant, the Guard advanced, while D'Erlon hurled the First corps against the British right. D'Erlon's assault was effective, but the Guard decimated by a heavy fire from Maitland's brigade, supported by those of Halkett and Elphinstone, were repulsed with terrific loss and fell back in complete disorder before the impetuous charge of the Fifty-second Regiment. Just then, about 7.30, the main body of the Prussians arrived, and going right into action, attacked the French right and threw it into confusion. At that moment, Wellington seeing that victory was assured, ordered a general advance of his lines and decided the contest. His troops, however, were too far gone to engage in the pursuit, which was taken up by the Prussians with vigor, and the retreat soon became a rout. Napoleon left the field in the centre of a square of the Imperial Guard. He left this at Genappe, and arrived at Charleroi at daybreak with a small escort of horsemen. He reached Paris 21 June, and signed the second abdication on the 22d. The entire campaign had lasted but three days, and the battle itself, one of the most remarkable and terrible of modern times, was decided in eight and a half hours. The French lost in killed, wounded, and missing, about 31,000 men, and the Allies, about 23,000.

Bibliography.—The literature upon the subject is very extensive, but for the most reliable and exhaustive information consult: 'The Campaign of Waterloo,' J. C. Ropes, New York 1892; 'Waterloo Lectures,' Chesney, London 1874, and 'Quatre-Bras, Ligny, and Waterloo,' Gardner, London 1882.

Waterman, Nixon, American author: b. Newark, Ill., 12 Nov. 1859. He was connected with the Omaha *World-Herald* and *Bee* 1887-90; with the Chicago *Herald* and *Post* 1890-3, and since 1895 has resided near Boston engaged in literary work. He is the author of 'A Book of Verses' (1900); 'In Merry Mood: a Book of Cheerful Rhymes' (1902); 'The Whistling Girl,' a comedy (1903); 'Cap and Bells' (1903).

Watermelon. See MELONS.

Waterproof Cloth, cloth rendered impervious to water. There are numerous processes for waterproof fabrics of all kinds. The earliest patent, that of Macintosh (1823), consisted in covering cloth with a paste obtained by dissolving caoutchouc in benzol or coal naphtha. In the treatment of cotton and linen cloth a small proportion of sulphur is generally added. A thin layer of this rubber solution is spread on the fabric by special machinery, after which the cloth is doubled, pressed, and finished in calendars, the waterproof layer being thus in the centre of the finished material. Textiles thus

manipulated become also impervious to air, and from a hygienic point of view unsuitable for prolonged personal wear. This led to the introduction of other solutions and methods of application intended to produce fabrics, which, while resisting rain, do not altogether obstruct ventilation. Consecutive dipping of cloths in soap and alum solutions, or in gelatine and gall solutions, or in a solution of acetate of lead and then in a solution of alumina, has been resorted to with more or less success. The new substance called algin, obtained from sea-weed, has been strongly recommended for the same purpose. Another recent patent process consists in treating the fibres in the solution instead of the manufactured textile, and the fabric thus produced, while rain-resisting, offers the same ventilation as ordinary materials. See RUBBER MANUFACTURES.

Waters, wà'tèrz, Clara Erskine Clement, American writer: b. Saint Louis, Mo., 28 Aug. 1834. She was married to James H. Clement in 1852, and after his death to Edwin F. Waters. She has traveled widely, and is well known as a writer and lecturer upon art. Her writings include: 'Legendary and Mythological Art' (1870); 'Eleanor Maitland' (1881); 'Life of Charlotte Cushman' (1882); 'Stories of Art and Artists' (1887); 'Women Artists in Europe and America' (1903); etc.

Waters, Underground. A certain amount of the water that falls on the earth's surface passes underground, the percentage varying with the porosity of the surface materials. This absorption of water is due to the fact that all rocks are somewhat porous and considerably fissured. Sand and gravel deposits are very porous and can store from 5 to 15 per cent of their bulk of water. Sandstones have space between their sand grains, but their porosity varies greatly with size of grain and especially with the amount of cementing material filling the interspaces which in the case of quartzite and some highly calcareous sandstone, fills these spaces entirely. Most sandstones, however, are porous and many hold from 5 to 10 per cent of their bulk of water. Limestones are only slightly porous, but they are always traversed by joint planes and usually, toward the surface, by channels and caverns. Clays, shales and slates have but little capacity for water and the crystalline rocks, such as granite, have very slight porosity. Crystalline rocks, however, are usually traversed by many joint planes and often by zones of decomposition along which surface waters descend for a greater or less distance. In many districts, also, the crystalline rocks are deeply decomposed by the solution of some of their components, and the resulting "rotten rock" is usually as porous as many sandstones. Many lavas are porous and they usually are extensively fissured. Water passes underground in various ways, of which the following are the most prominent: direct inhibition of rainfall; the sinking of surface flows in passing over zones of porous rock; the spreading of streams laterally into the porous deposits of their valleys; and the percolation of water laterally from the ocean or lakes into the materials of the shore. In all regions it is found that the surface run-off and evaporation do not equal the rainfall, which is evidence of general inhibition of water. Many streams are observed

WATERS

to diminish in volume and even to disappear entirely in running over areas of porous sandstones, cavernous limestones, or especially permeable portions of their beds. In many arid regions, waters flow out of the mountains in rock beds and at once sink in the sands of the valleys. In nearly all river valleys there are alluvial deposits in which the water extends laterally from the main stream and some water courses have water only in the sands and gravels of their beds for the greater part of the year.

Waters present various conditions underground, in some cases flowing to lower levels, through permeable rocks, caverns in limestone, or crevices in the harder rocks, to emerge as springs in hillsides, valley bottoms, or even out under the ocean, as off the east coast of Florida. Usually the water supply fills an underground reservoir of sand, gravel, porous sandstone, decomposed crystalline rock, or fissures. Water under this condition is usually designated "ground water" and its surface level is known as

similar but the water at *D* escapes in springs, so there is a constant flow from *C* toward *D*. On account of this flow to a lower level there is gradual diminution of "head" of the water from *C* to *D*, known as the "hydrostatic grade." This condition is found in the Central Great

FIG. 2.

Plains of the United States, where there is a bed of porous sandstone with an average thickness of 200 feet, underlying more than 500,000 square miles and in places lying 5,000 feet deep, but apparently filled with water throughout. Many wells draw artesian supplies from this sandstone and in some areas the flows have a surface pressure of over 200 pounds to the square

FIG. 1.

the "water plane." In some cases ground water may occupy strata or follow down crevices, for a depth of several hundred feet. Waters which extend far underground are mainly contained in sandstones and some of these water-bearers are of vast extent and often descend to great depths. Two conditions which frequently exist are

FIG. 3.

shown in the above cuts: Fig. 1. Cross-sections showing conditions of underground water in permeable strata. In these sections, a bed of sandstones reaches the surface at *A*, where it receives water from rainfall or sinking of streams. This water passes underground and an artesian basin is formed which would yield a flowing well at *B* and at other points where the land is less elevated than at *A* and *A*. In the second section, the conditions are somewhat

inch. Hundreds of billions of gallons are contained in this stratum. The rate of travel of underground water is slow, averaging about one mile a year in moderately porous sandstone.

In the accompanying figures are shown some conditions of underground waters which have been referred to above. Fig. 2.—Sections of a river valley, showing the relations of underground waters. This valley is cut in rock but partly filled with sand and gravel, as shown by the stipple. The river flows on the surface at *A* but the waters also flow slowly underground in an "underflow" and pass laterally into the sands, filling them to the "water plane" *B B* at the level of the river. Fig. 3.—Fissured and decomposed crystalline rock. Surface waters often sink deeply and occur in considerable volume under the conditions shown in this figure. *A* is the zone of decomposition and disintegration of the rock. *B B* are fissures down which the decomposition has progressed still deeper. This condition is found over wide areas in the Piedmont region of the southeastern United States.

United States Geological Survey.

WATERSHED — WATERTOWN

Watershed. See RIVER.

Waterton, Charles, English naturalist: b. Walton Hall, Wakefield, 3 June 1782; d. 27 May 1865. He was educated at the Roman Catholic College at Stonyhurst, where he evinced a great taste for natural history. He spent many years in travel, and in 1825 published 'Wanderings in South America, the Northwest of the United States, and the Antilles in the years 1812, 1816, 1820, and 1824,' a book which has had great popularity. An illustrated and slightly altered edition was published under the direction of J. G. Wood in 1879. His only other publication is 'Essays in Natural History, with an Autobiography.' These appeared originally in three series (1838, 1844, 1857). In 1870 Norman Moore produced a new edition of them, together with some of his letters and a life. He lived a secluded life for many years at Walton Hall, where he formed a curious collection of animals.

Watertown, Mass., town in Middlesex County; on the Charles River, and on the Boston & Maine Railroad; eight miles west of Boston. It contains the villages of Bemis, Watertown, and Mount Auburn. It is connected with Boston and many of the suburban towns by electric railways. It was first incorporated in 1630. It has a number of manufacturing establishments, chief of which are woolen mills, hosiery works, starch factory, and needle factory. In 1900 (government census) the town had 105 manufacturing establishments, capitalized for \$4,549,242, and employing 2,304 persons, to whom was paid annually the sum of \$1,130,099. The cost of raw material used was \$3,811,808, and the value of the annual products was \$6,078,902. At the U. S. arsenal located here a large amount of modern ordnance work is being produced. The famous Mount Auburn (q.v.) Cemetery is in the town of Watertown. There are two banks, one national and one state. The national bank has a capital of \$100,000, and deposits amounting to \$300,000. The state bank (Watertown Savings Bank) has deposits amounting to \$1,256,660. Pop. (1890) 7,073; (1900) 9,706.

Watertown, N. Y., city, county-seat of Jefferson County; on the Black River (about 10 miles from its entrance to Black River Bay, an arm of Lake Ontario), and on the New York Central & Hudson River Railroad (Rome, Watertown & Ogdensburg and Utica & Black River branches); about 90 miles northwest of Utica and 70 miles north of Syracuse.

Industries.—The city lies on both sides of the river, which here has a fall of 112 feet, producing a 16,500 horse-power. From Carthage, a village 16 miles above the city, to Dexter, eight miles below the city, the river is lined with busy manufacturing villages, all of which contribute in some measure to the prosperity of Watertown. Along this 24 miles of frontage, the investment in paper mill plants alone is over \$7,000,000, and the daily output from the mills is 440 tons. About 2,000 persons are engaged in the paper industry. In the city, besides the many paper mills, other large manufacturing are four carriage works, whose products are shipped all over the world; the Bagley-Sewall Company, manufactory of vases and paper machinery, portable steam-engine works, two large silk mills, running many looms and turning out an excellent product; two thermometer works; one factory producing chemical

and scientific instruments; lock and brass works, plow factory, and pump factory. The air-brake works, which has a thriving branch in Russia, having outgrown its original quarters, purchased several hundred acres of land on the north side of the river, and built shops that will accommodate many thousands of workmen. A city of mechanics' homes is growing up around the works. Watertown has two large flour mills which cater to the wholesale trade; one of the mills manufactures health foods, which are shipped all over the United States and to many foreign markets. According to the United States census of 1900, within the city limits, in the manufacturing establishments, there were employed 4,017 persons, who received annually, for their services, over \$2,100,000. The raw material used each year cost \$4,152,444, and the value of the finished products was \$7,881,977. The manufacturing plants were then capitalized for \$8,281,845. These figures apply to the industrial establishments within the city limits in 1900. Since then the city limits have been extended, many new manufacturing have been established, and nearly all the old plants have been enlarged, so that now (1904) the number and value of the city's manufacturing and products are greatly in excess of 1900.

Trade.—Watertown is the commercial and industrial centre of a large rich agricultural region, and it has an extensive wholesale trade in all kinds of merchandise. It is the distributing centre for a large number of towns and villages. The principal shipments are the products of its manufactories and farm and dairy products. In 1903 over 200,000 boxes of cheese were sold in the city for about \$1,250,000. It has direct shipping connection with all the cities and villages within 100 miles, and with the Lake Ontario ports.

Buildings and Municipal Improvements.—The mercantile blocks of the city are built around a large parallelogram, and on five of the most important streets. This parallelogram is adorned with parks, a fountain, and a soldiers' monument. Some of the prominent public buildings are the government building, State Armory, opera-house, the banks, and several of the business blocks. The city has 49 miles of water-pipe, 400 hydrants, a daily consumption of 3,500,000 gallons of water, a pump capacity of 6,000,000 (average water pressure, 60 pounds per inch), and a reservoir capacity of 5,000,000 gallons. A filter, at a cost of \$100,000, will be completed in 1904. Watertown has an area of seven square miles, 70 miles of streets, and is lighted by gas and electricity. There are two hospitals; the City Hospital, to which new buildings are constantly being added, and the Saint Joachim. The latter is conducted by Sisters of Mercy. There are two orphanages, and the Henry Keep Home, a refuge for the aged. The bureau of charities and the supervisor of the poor department are most efficient departments. A beautiful park crowns and overlooks the city. It covers about 600 acres, upon which for several years there has been an annual expenditure of \$75,000. The name of the donor has not been made public. The city's mean temperature, in summer, is 65° F. and in winter 20° F.

Churches, Schools, Libraries.—The city has 23 churches valued at over half a million; Trin-

WATERTOWN—WATERVLIET

ity, Protestant Episcopal, cost \$150,000; Holy Family, Roman Catholic, \$100,000. There are 11 school buildings valued at \$377,250; the high school cost \$100,000. The high school was established in 1869. The public school teachers number 112, the number of pupils enrolled, in 1903, was over 4,000. Other educational institutions are Immaculate Heart Academy, private business schools, and several school libraries. The Flower Memorial Library, a modern building, is the gift of Mrs. Emma Flower-Taylor, in honor of her father, Roswell P. Flower (q.v.). The building is white marble and cost \$200,000.

Banks.—Watertown has seven banks, five national and two state. The national banks have a combined capital of \$571,240, and the deposits in the seven banks (1903) amounted to \$9,349,370.

Watertown was settled in 1800 by H. Coffen and Zacharia Butterfield. It was incorporated 5 April 1816, and chartered as a city in 1869. Pop. (1880) 9,883; (1890) 14,725; (1900) 21,666.

R. A. OAKES.

Watertown, S. Dak., city, county-seat of Coddington County; on the Big Sioux River, and on the Chicago & Northwestern, the Minneapolis & Saint Louis, the Burlington, Cedar Rapids & Northern, the Chicago & Northwestern, and the Great Northern R.R.'s; about 100 miles north by west of Sioux Falls. It is in a fertile agricultural region, in which the chief product is wheat. Stock-raising is given considerable attention. The city has flour mills, machine shops, large grain elevators, and stock-yards. It has an extensive trade in grain and live-stock. About three miles from the city is Lake Kampeska, one of the beautiful bodies of water of the State. There are eight churches, a public high school, and graded elementary schools. The three national banks have a combined capital of \$125,000 and deposits amounting to \$819,100. Pop. (1890) 2,672; (1900) 3,352.

Watertown, Wis., city in Jefferson and Dodge counties; on the Rock River, and on the Chicago, Milwaukee & Saint Paul and the Chicago & Northwestern R.R.'s; about 44 miles west of Milwaukee and 38 miles east of Madison, the capital of the State. It is on both sides of the river, and has considerable water-power, which is utilized by various manufacturing establishments, chief of which are a large shoe factory, flour mill, foundry, machine shops, brewery, cigar factories, box factory, furniture factory, and creameries. In 1900 (government census) the city had 86 manufacturing establishments, capitalized for \$1,776,312. The value of the annual products was \$1,625,982. Watertown has several educational institutions, chief of which are College of Our Lady of the Sacred Heart (R. C.), Northwestern University (Lutheran), a high school, three large public schools, two parish schools, and a free public library. The three banks have a combined capital of \$275,000 and deposits amounting to over \$1,100,000. The gov-

ernment is vested in a mayor and a council of 14 members, elected biennially.

Watertown was first settled by Timothy Johnson, in 1836, and was incorporated in 1837. In 1853 it was chartered as a city.

JAMES W. MOORE,
Editor 'Gazette.'

Waterville, Maine, city in Kennebec County; on the Kennebec River, and on the Boston & Maine Railroad; about 17 miles north by east of Augusta and 78 miles northeast of Portland. It was settled about 1760 by emigrants from Cape Cod, and was part of Winslow until 1802, when it was set off as a town and incorporated. In 1873 West Waterville was set off from Waterville, and in 1888 the city charter was granted. The Wakefield & Fairfield and the Waterville & Oakland electric railways connect the city with all the near-by places. The Ticonic Falls furnish some of the water-power used by the manufactories. The chief industrial establishments are the cotton mills, which have 1,100 employees; railroad shops, 300 employees; woolen factories, 500; and shirt factory, 150. There are about 300 men in the employ of the railroad as train and yard men, and a total of about 500 employees in a number of the small manufactories. In 1900 (government census) the total number of employees was 2,257. There were 89 manufactories, capitalized for \$3,972,016, which produced each year finished products amounting to \$2,802,236. There are nine churches, Colby College (Baptist), founded in 1818; Coburn Classical Institute, Ursuline Academy (R. C.), a public high school, public and parish elementary schools, and school libraries. The four banks have a combined capital of \$500,000. The Waterville Savings Bank has deposits amounting to \$1,195,000 (January 1903). The government is vested in a mayor, seven aldermen, and 14 councilmen, elected annually. There are a number of French Canadians, but the majority of the inhabitants are native born. Pop. (1890) 7,107; (1900) 9,477.

THOS. F. MURPHY,
Editor 'Sentinel.'

Waterville, N. Y., village in Oneida County; on the Lackawanna Railroad; about 22 miles southwest of Utica. It is in an agricultural region in which hops and vegetables are the chief products. It has steam grist mills, wood-work factory, and shoe factory. The principal public buildings are the Granger and Masonic halls, the Y. M. C. A. building, and the churches and schools. There are six churches, a high school established in 1872, public graded schools, and a public library. There are two banks; the national bank has a capital of \$150,000. Pop. (1890) 2,024; (1900) 1,571.

Watervliet, wā-tēr-vlēt', N. Y., city in Albany County; on the Hudson River, the Erie Canal, and the Delaware & Hudson Railroad; opposite Troy and four miles north of Albany. It is connected with Albany by steam and electric railways, and thus with the New York Central & Hudson River Railroad. It is connected with Troy by an iron bridge, over which pass electric cars for both passengers and freight, and by regular ferry-boats. It is at the head of river navigation and has, by means of the Hudson River, water connections with New York and intermediate points, and by means of Erie

WATERWAYS OF THE UNITED STATES

Canal with the interior of the State and with Lakes Ontario and Erie ports.

Industries.—Watervliet is a manufacturing city. In 1900 (government census) there were 135 manufacturing establishments, which were capitalized for \$1,826,691 and which employed 1,167 persons. The value of the yearly products was \$1,809,241. It has manufactories of woolen goods, bells, iron products, sashes, doors, and blinds, metal harness parts, street cars, car-journal bearings, machine-shop products, and scales. In 1807 the U. S. government established here the Watervliet Arsenal, one of the largest plants for the construction of siege ordnance and field and coast defense belonging to the United States. The arsenal is on a reservation of 109 acres, which has a wharfage, on the Hudson, of 1,000 feet. The usual manufactures for use in war are produced here, as shot and shell, small ammunition, gun-carriage equipments, etc. There are two large stone magazines. On the reservation are quarters for the officers and barracks for the soldiers and also for any civilians who may be employed in the works. There is also a hospital. During the Mexican and the Civil wars there were about 1,500 persons employed, who worked in relays, day and night, preparing materials for the U. S. army. Since 1892 some of the largest guns in the U. S. service have been made here, and the construction works have been constantly in operation on the large guns and necessary equipment required for the army and navy and for coast defenses.

Churches and Schools.—There are 10 churches representing six different denominations; a high school established in 1899, Saint Patrick's Academy, four public schools, four parish schools, a Union Free Library, and a high school library. There is a graded school in connection with Saint Colman's Orphanage.

History.—Watervliet was settled about the time when settlements were made at Albany and other places on the Hudson. It was incorporated as a village, and called West Troy in 1836. In August, 1897, it was chartered as a city under the name of Watervliet. Its industrial growth has been closely connected with the work of the government arsenal. It has many of the social and educational advantages of Albany and Troy. Pop. (1890) 12,967; (1900) 14,321.

Waterways of the United States, The. The atlas of the world shows that three fourths of its surface is covered with water. The waters of the earth comprise oceans, seas, gulfs, bays, lakes, and rivers. In the main these are navigable, but where not navigable, much has been done to make them so. In addition thereto, extensive systems of intersecting canals have been constructed, so that natural and artificial waters of the world, known as "waterways," comprise all its oceans, seas, gulfs, bays, many of its lakes and rivers, and all navigable canals.

In the United States the ebb and flow of the tide is not the test of navigability, as it was in England before it was abolished by 24 Vict., ch. 10. The Supreme Court of the United States held in the *Daniel Ball*, 10 Wall. 557, that a different test than tidal variations must be applied here to determine navigability. The court say that those rivers must be regarded as public navigable rivers in law, which are navigable in fact; and they are navigable

in fact when they are used, or are susceptible of being used, in their ordinary condition, as highways for commerce, over which trade and travel are or may be conducted in the customary modes of trade and travel on water. The commercial power of Congress authorizes such legislation as will insure the convenient and safe navigation of all navigable waters of the United States, whether that consists in requiring the removal of obstructions to their use, in prescribing the form and size of the vessels employed upon them, or in subjecting the vessels to inspection and license. The power to regulate commerce comprehends the control for that purpose and to the extent necessary, of all navigable waters of the United States which are accessible from a state other than those in which they lie. For this purpose they are the public property of the nation, and subject to all the requisite legislation of congress. Recently in *Perry v. Haines*, 191 U. S. 17, the same court decided that admiralty jurisdiction extends to cases of maritime liens upon vessels navigating the Erie canal, as that formed part of a navigable highway for interstate commerce between Lake Erie and the ocean. Thus artificial as well as natural navigable waters are being recognized as public waters in the sense in which Bracton used that term in the rule that *publica vero sunt omnia flumina et portus*. Years ago the English courts decided that the river Severn was a public highway, and the courts of this country have followed the decisions of the Supreme Court of the United States heretofore stated in regard to public navigable waterways. An interior nation has a servitude along natural water courses to reach the highway of nations, known as *jus transitus*, which is recognized by the law of nations. The right of transit over the Danube below the Iron Gates is secured by agreement. In the United States and in Canada, the rivers do not generally flow in foreign territory, so that it is not necessary to invoke the doctrine of *jus transitus*, except in a few cases, as along the Richelieu and lower Saint Lawrence.

The waterways of Maine include 240 miles of seacoast, with many bays indenting it and scores of islands strewn along it. The Saint Croix River on the east is the outlet of Grand Lakes. The Penobscot is 275 miles long and navigable to Bangor by large vessels. It is the outlet of several lakes in central Maine and flows into Penobscot Bay, 30 miles long and 15 miles wide. The Kennebec is 160 miles long and navigable to Augusta. It is the outlet of Moosehead Lake, which is 36 miles long and from 8 to 12 miles wide, and navigated by pleasure steamers. The Androscoggin River drains the famous Rangeley lakes and other lakes, and flows 200 miles into the Kennebec near its mouth. It is navigable only in part and by river craft. Sebago Lake is 12 miles long and 10 miles wide and navigable by small steamers. The principal seaport, Portland, has large commerce and there are several ship yards along the coast. New Hampshire has but little sea-coast and no navigable rivers. Those parts of the Merrimac and Connecticut which pass through New Hampshire are not navigable, except by small river craft and by rafts. The inland lakes of New Hampshire are navigable by small pleasure boats. The same is

WATERWAYS OF THE UNITED STATES

true of the rivers of Massachusetts. It has, however, Boston Harbor, Massachusetts Bay, Cape Cod Bay, which is to be connected with the Atlantic by a canal across Cape Cod, Nantucket Sound, Vineyard Sound, Buzzard's Bay, and several other small bays, all in communication with the ocean. Taunton River is navigable to Taunton, 12 miles from its outlet, which empties into Mount Hope Bay. The Mystic and Charles rivers are navigable at their mouths only. Salem, as a commercial port, has a reputation far more enviable than that for witchcraft.

Vermont has part of Lake Memphremagog, which is navigable by lake steamers, and part of Lake Champlain, 120 miles long and 15 miles wide in its extreme width, which has been, since its discovery on 4 July 1609, a highway of commerce for the aborigines, for the colonists, and for Americans generally. It is navigated by large lake steamers, by scores of other steamers, and by many yachts and sailing vessels. It is one of the most picturesque lakes in America and forms an important portion of the 467 miles of waterway between the Saint Lawrence on the north and New York Bay on the south. It contains several beautiful islands such as Isle La Motte, North Hero, and South Hero. Lake Champlain is to be connected with the waters of the Hudson River at Fort Edward by the improved Champlain Canal, having a depth of 12 feet of water, so that vessels drawing 10½ feet may pass from Lake Champlain through into the Hudson River. This will greatly increase the commerce on the lake.

Rhode Island has Narragansett Bay, Mount Hope Bay, Providence and Sakonnet rivers. These are navigable and are frequented by some of the best equipped vessels in America and by hundreds of pleasure boats. The merchant marine of the ports of Rhode Island in 1903 comprised 88 vessels of 15,835 tons. Connecticut has part of Long Island Sound, the Thames River, navigable to Norwich, the Connecticut River, navigable to Hartford, the Naugatuck River, navigable by small craft for a few miles and the Housatonic, 150 miles long and navigable to Shelton. It has several towns along its waterways, such as Stonington, Norwich, New London, New Haven, and Bridgeport. Long Island Sound is 110 miles long and 20 miles wide. It is a great waterway for several superb steamboat lines plying between New York and towns and cities on its northern shore. The Connecticut River at one time was navigated by a number of river boats and had considerable commerce. A line of boats ran between Wells River, Vt., and Hartford. The boats were flat boats and did not draw much water. The Barnet was the first steamer for Connecticut River service. It drew 22 inches of water. On its first trip from Hartford to Vermont it had in tow a barge filled with people. Other steamers were built for river service, in which they were engaged for many years. This river was a great natural highway for the transportation of produce to market. The rapids in the river were overcome by canals at South Hadley Falls, at Turner Falls, and at Bellows Falls.

The waterways of New York comprise that portion of the Atlantic Ocean washing Long Island on the south, and that part of Long Island Sound washing Long Island on the north, and also the upper and lower New York

bays, and a portion of Staten Island Sound, and all of the East, Harlem, and Hudson rivers. New York is the largest commercial port in the western hemisphere, and the second largest commercial port in the world, it being exceeded only by London. The total tonnage that entered that port in the year ending 30 June 1903, was 9,053,906 tons, and its clearances amounted to 8,847,072 tons, that being about one half of the entire tonnage of all the Atlantic ports for that year. Its unique position at the confluence of the East and Hudson rivers overlooking one of the finest harbors in the world, has added to its other commercial advantages and is destined to continue it as the emporium of the western hemisphere. On the north flows the picturesque Hudson, discovered in September 1609, and navigable by steam vessels 150 miles to the city of Troy, and by canal barges to Waterford. It is to be canalized from Waterford to Fort Edward. It receives on the west the waters of the Mohawk formerly navigable about 95 miles, to Little Falls, which is also to be canalized from the Hudson nearly to the city of Rome. The canalized Hudson and Mohawk are to form a part of the improved canal system of the State of New York, about to be constructed pursuant to the provisions of the Canal Referendum Law introduced in the Senate of the State of New York in the session of 1903 by Senator George A. Davis, chairman of the canal committee of the Senate, which law provides for the issue and sale of the bonds of the State, amounting to \$101,000,000, for the construction of a system of barge canals, having a bottom width of 75 feet and a depth of 12 feet, from the waters of the Hudson to those of Lake Champlain, Lake Ontario, and Lake Erie, adequate for barges carrying 1,000 tons. This law received the phenomenal popular approval of 245,000 majority in the State at the general election in 1903. This is the largest canal improvement project ever undertaken by one of the American States, and one of the largest ever undertaken in the history of the world. West of the city of Rome is Oneida Lake, into which flows Wood Creek, which is to be canalized and connected with the Mohawk. Oneida Lake, Oneida River, and Oswego River are all to be canalized, as well as the Seneca River from the Three River point to the outlet of Onondaga Lake, and thence southwesterly nearly to Seneca Lake. New York contains several beautiful bodies of water, such as Lake George, part of Lake Champlain, part of Lake Ontario, part of Lake Erie, Onondaga, Skaneateles, Cayuga, Seneca, Keuka, Canandaigua, and Chautauqua Lake, all navigable by steamers. Seneca Lake formerly had a large commerce, which undoubtedly will be revived by improving its outlet and forming a connection with the new 1,000-ton barge canal. It has also been proposed to improve the outlet of Cayuga Lake in a similar manner. All of these lakes are navigated by passenger steamers during the summer months. The waterways of New Jersey comprise a portion of the lower Hudson, upper New York Bay, Newark Bay, Staten Island Sound, Raritan Bay, the Atlantic Ocean and several arms of the ocean indenting the eastern coast of New Jersey, and Delaware Bay on the south, and the Delaware River on the west, and other rivers intersecting it. These

WATERWAYS OF THE UNITED STATES

are all navigable. The Delaware River on the west is between 300 and 350 miles long, and extends the entire length of its western border, dividing it from the States of Pennsylvania and Delaware. It is navigable to Philadelphia by ocean steamships, and to Trenton by ordinary river vessels. The Raritan River is navigable from Raritan Bay to New Brunswick, and from that point along the bed of the Raritan and Millstone rivers to Trenton is a canal, thus joining the waters of lower New York Bay with those of the Delaware. The total length of the Susquehanna River, including tributaries, is over 400 miles, and it is only partially navigable. It flows into the Chesapeake Bay, which is 170 miles long and 50 miles wide. The Delaware and Chesapeake bays are connected by a canal of 10 feet draft. In some portions of its course the Susquehanna has been canalized to overcome rocks and vegetable matter, which obstructed its navigation. Pennsylvania has suffered its extensive canal system to pass from its control. The Potomac River is about 400 miles long and navigable 125 miles for large vessels. It flows into the Chesapeake Bay from the northwest. It receives from the south the waters of the Shenandoah. The Rappahannock River is over 200 miles long and navigable for about 60 miles. The James River is 450 miles long and navigable as far as Richmond. The Roanoke River is 450 miles long and navigable to Weldon. The Roanoke flows into Albemarle Sound, which is about 50 miles long and from 5 to 8 miles wide, and it communicates through Croatan Sound with Pamlico Sound, which is 75 miles long and about 20 miles wide. Both of these sounds are connected with the Chesapeake by the Chesapeake and Albemarle Canal, having a depth of 11½ feet and doing an active business.

The sounds are shallow and communicate with the Atlantic Ocean. Into Pamlico Sound flows the Pamlico and the River Neuse. The Savannah River, whose length including tributaries is 550 miles, is navigable by large vessels to Savannah, and by small vessels to Augusta. The Great Pedee River is navigable 150 miles and flows into the Atlantic Ocean. The St. John's River in Florida is navigable for steamers 150 miles, and small vessels go 150 miles further up. It connects several lakes, some of which communicate with the ocean. The Suwanee River is 250 miles long and navigable in its lower course. The Apalachicola River is 90 miles long and is navigable in its lower course. The Tallapoosa River, 250 miles long and navigable for 40 miles, and the Coosa, 350 miles long, unite to form the Alabama River, 8 miles west of Montgomery. The Alabama River is 350 miles long and navigable from the junction of these two rivers to the Mobile. The Tombigbee, 450 miles in length, unites with the Alabama to form the Mobile, which flows into Mobile Bay and is navigable to Aberdeen in Mississippi. The Tombigbee receives the waters of the Black Warrior River, which is 300 miles long, and navigable to Tuscaloosa. The Mobile River is 45 miles long, and Mobile Bay is 36 miles long and its width is about 10 miles. There are many small lakes in the interior of Florida, which communicate with the Atlantic Ocean. Many other lakes in Florida are connected by rivers and

canals. One of the largest of these is Lake Okeechobee, which is connected by canal and river with the Charlotte Harbor, on the west coast of Florida. There are many bays and inlets indenting the sea-coast from Florida to Mexico. Among the largest of these are Tampa Bay, Choctawhatchee Bay, Perdido Bay, Pensacola, Mobile, Lake Pontchartrain, Lake Borgne, and Mississippi Sound, Timbalier Bay, Cerrebonde Bay, Atchafalaya Bay, Vermilion Bay, Côte Blanche Bay, Sabine Bay, and Galveston Bay.

The Mississippi River, which empties into the Gulf of Mexico, is navigable as far as Saint Paul, a distance of about 2,000 miles, by vessels of moderate draft. It has several large tributaries. On the east is the Yazoo, 280 miles long, and navigable 240 miles. The largest tributary on the east is the Ohio. It is 1,100 miles long and from ¼ to ½ mile wide, and is formed by the union of the Allegheny and Monongahela rivers, and is navigable by vessels drawing six feet of water. Dams have been constructed at 38 different points in the river between Pittsburg and Cincinnati to raise the water levels in the intervening sections. The dams are passed by locks 600 feet long and 110 feet wide, having a depth of 6 feet of water. The Monongahela River is navigable for upward of 100 miles above its confluence with the Allegheny by large river craft, and for a distance of 50 or 60 miles further by small river craft. The Allegheny River is navigable from Waterford near French Creek and 15 miles from Lake Erie to its outlet at Pittsburg. The Ohio River has several tributaries, such as the Kenanas, Beaver, Muskingum, Sandy, Scioto, Miami, the Licking, the Kentucky, the Salt, Green, Wabash, Cumberland, and Tennessee. The Muskingum is 240 miles long, navigable 95 miles. The Scioto is 250 miles long and navigable 130 miles. The Kentucky is 250 miles long, navigable to Frankfort. The Wabash is 550 miles long, and receives as a tributary on the east the White River. The Tennessee, with its longest tributary, the Holston, is over 100 miles long, and is navigable the greater part of its length. The Cumberland is over 600 miles long and is navigable to Nashville, nearly 200 miles. The tonnage passing down the Ohio River in 1902 was 1,472,575 tons, consisting of coal, steel rails, lumber, sugar, and molasses. There are about 40,000,000 bushels of coal shipped annually from Pittsburg down the Ohio River. In the development of this country the Ohio River was one of the great highways over which the tide of civilization passed westward. Sail boats have given way to barges and steamboats, and the commerce of the Ohio and its tributaries is increasing from year to year, and the number of vessels on the Mississippi and on the Ohio is estimated to be more than 4,000, which annually enter the port of New Orleans. A project is under consideration in Ohio for the construction of a system of canals from Lake Erie on the north to the Ohio River on the south, involving an enormous outlay of money, rendering such canals navigable for barges of 500 tons capacity and upward. The next tributary to the Mississippi on the east is the Illinois, which is 500 miles long, navigable for 245 miles, and receives the waters of the Kankakee and the Desplaines, which latter river has been in part

WATERWAYS OF THE UNITED STATES

canalized and in part paralleled by the Chicago Drainage Canal, 28.05 miles long, 22 feet deep, and 110 feet wide on the bottom, to the south branch of the Chicago River, which communicates through the north branch with Lake Michigan. These form a continuous waterway from the Mississippi River through to Lake Michigan at Chicago. The Chicago Drainage Canal has been made navigable for vessels drawing 22 feet of water, and has the largest prism of any canal of its length in the country. In 1848 the Illinois and Michigan Canal was completed, having a length of 96 miles and a depth of 6 feet, and extending from Chicago to La Salle. Congress authorized the survey for the Hennepin Canal in 1882, connecting the waters of the Illinois River at Hennepin with those of the Mississippi at Rock Island. The Mississippi also has the Wisconsin River as a tributary on the east, which is 600 miles long and navigable up to Portage City, where it connects by a canal with the head-waters of the Fox River in Wisconsin. It flows westerly into the Mississippi. The Fox River, 200 miles long, flows northeasterly through Lake Winnebago into Green Bay. It is navigable. These two rivers and canal form a continuous waterway from the Mississippi to Lake Michigan, which has been declared by the courts a public highway. Through the Wisconsin and Fox rivers steamers may pass from the Mississippi into Lake Michigan. This is one of the three waterways mentioned in Smith's 'History of Wisconsin,' which connect the waters of the Mississippi with those of the Saint Lawrence, the other two being the Illinois and Desplaines rivers and the Miami of the Lakes. The next tributary of the Mississippi on the east is the Saint Croix River, which is navigable for 60 miles. The upper Mississippi is navigable between Saint Anthony's Falls and the Sauk Rapids. The Mississippi River drains several lakes in the central part of Minnesota. The first tributary on the west is the Minnesota, 450 miles long, and navigable to Patterson's Rapids, a distance of 295 miles. The Minnesota River drains Big Stone Lake and Lake Traverse, into which latter lake flows the Red River of the North, which is 700 miles long. The next tributary to the Mississippi is the Des Moines River, 500 miles long, navigable to the city of Des Moines. The next tributary is the Missouri River, which with one of its principal tributaries, the Madison, is over 3,000 miles long, and is navigable for shallow vessels to Fort Benton on the Madison, 2,682 miles. The channel of this river changes so frequently that its navigability is seriously interfered with. The Missouri receives on the east as tributaries the river James and the Big Sioux. On the west the Little Missouri and the Yellowstone, which latter river is over 1,000 miles long and navigable to the mouth of the Big Horn. The Yellowstone River drains the Yellowstone Lake. Other tributaries of the Missouri are the Green River, the Owl, the Big Cheyenne, the White, the Niobrara, all lengthy, but none of them navigable. The Nebraska or Platte, formed by the North and South Fork, and including the North Fork 1,000 miles long, and the Kansas River, including Smoky Hill Form, 900 miles, are all lengthy tributaries of the Missouri, but are not navigable. Congress has been asked to make appropriation, however, to render some of these

lengthy rivers navigable for commercial purposes. The next tributary to the Mississippi on the west is the Saint Francis River, 450 miles long, navigable 80 miles. The next is the White River, 800 miles long and navigable 175 miles to Batesville. The next large tributary to the Mississippi is the Arkansas, 2,000 miles long, and navigable for 800 miles. It has several large tributaries, the most important of which is the Canadian, 900 miles long, and having a tributary, the North Fork, 600 miles long. Another long tributary of the Canadian is the Cimarron. The waters of the Arkansas supply large irrigating canals in Colorado. There are many irrigating canals supplied by the waters of this and other rivers in the vicinity of the Rocky Mountains. The next tributary to the Mississippi is the Red River, 1,200 miles long, and navigable to Shreveport. It has two tributaries on the north, the Washita and the False Washita.

The river Calcasieu, in Louisiana, 200 miles long, flows into Calcasieu Lake, and that empties into the Gulf of Mexico. This river is only partially navigable. Both the river Sabine, 500 miles long, and the River Neches, 350 miles long, flow into Sabine Lake, and that empties into the Gulf of Mexico. The Trinity River in Texas is over 500 miles long, and navigable about half its length. It flows into Galveston Bay, which is 35 miles long, and affords one of the best harbors in the Gulf of Mexico, from which great quantities of produce are exported. The Brazos River is over 900 miles long, navigable over 200 miles, and flows into the Gulf of Mexico. The Colorado River is 900 miles long and navigable during certain seasons of the year as far up as Austin. This river empties into Matagorda Bay. The Guadalupe and the San Antonio rivers are both about 200 miles long, and the Nueces is about 400 miles long, and all flow into bays on the coast of Texas. These rivers have many small tributaries that are not navigable. The Rio Grande is the largest river next to the Mississippi flowing into the Gulf of Mexico. It is 1,800 miles long and navigable by small craft about 450 miles to Kingsbury Rapids. The Colorado River flows into the Gulf of California, is 2,000 miles long and navigable 612 miles. Its largest tributary is the Gila, about 650 miles long. The Sacramento River flows into San Francisco Bay, which is 40 miles long and 12 miles wide, and affords one of the best harbors in the world. On the north in connection with it is San Pablo Bay, which is only 18 feet deep, and into which through the Straits of Karquines flows the Sacramento River. The Sacramento is 500 miles long. Its largest tributary is the San Joaquin, which is 350 miles long, and navigable for large steamers to Stockton, and for small steamers about two thirds of its course. There are other small rivers flowing into the Sacramento from the east.

Improvements undertaken by the general government and the State of California have opened up the Lower Sacramento and connecting waters until the range of tidal action has been extended as far up as Sacramento City, and rendered it navigable for vessels drawing from 10 to 15 feet of water. The Columbia River is about 1,400 miles in length, and flows into the Pacific through a wide mouth, upon which is located Astoria. Upon this river are

WATERWAYS OF THE UNITED STATES

located important salmon fisheries. It is navigable 165 miles to the first Cascade, and above these it is navigable on another level for about 50 miles to the second Cascade, and above those it is navigable for small vessels for a considerable distance further. It has several navigable tributaries. Among these is the Willamette in Oregon, 280 miles long, navigable to the falls at Oregon City, and above them to Eugene City. It receives on the east as a tributary the Snake River, 1,100 miles long, navigable to Lewiston. In Washington there are several bodies of water, such as Lake Chehalis, navigable for small pleasure boats. On the northwest in Washington, communicating with the Strait of Juan de Fuca is Puget Sound, setting far into the interior of the State of Washington. It is about 80 miles long, and is divided into two or more channels. On the easterly shore are located Seattle and Tacoma, and on the south, Olympia. It affords one of the best harbors on the Pacific coast. There are many rivers flowing into the Great Lakes, most of which are not navigable. Among such, however, as are navigable are the Fox River in Wisconsin, already described, which flows into Green Bay, which is 115 miles long and 15 miles wide, and has an extensive commerce. The Grand River in Michigan has been declared to be a public navigable waterway between Grand Rapids and Grand Haven. It flows into Lake Michigan and is over 250 miles long, and is navigable to Grand Rapids by steamers of 120 tons burden. The Saint Joseph River, which flows into Lake Michigan, and is 250 miles long, navigable for about half its length. The Chicago River, a waterway navigable for large lake vessels within the city of Chicago and one of its branches now forms a part of the waterway connecting Lake Michigan with the Mississippi. Between the United States and Canada are five great lakes, constituting together the largest freshwater bodies in the world. Lake Superior on the west is the largest of these, being 412 miles long and has an average width of 70 miles, but its maximum width is 167 miles. It is over 475 feet deep and receives the waters of many small rivers flowing into it. Lake Superior flows, through St. Mary's River, about 50 miles long, into Lake Huron. The United States government has constructed a ship canal to overcome rapids in this river, which is $1\frac{1}{2}$ miles long, 100 feet wide, with a minimum depth of 22 feet of water. The Canadian government has also constructed a canal $1\frac{1}{2}$ miles long, 150 feet wide, with a lock 900 feet long, and 60 feet wide, with a minimum depth of 22 feet. The volume of tonnage through these two canals in the year 1903, was 34,674,437 net tons, and the number of vessel passages was 18,596; and the aggregate freight charges on such tonnage for its entire transit was \$26,727,735. Three quarters of such tonnage was from Lake Superior to other lake ports, and less than one quarter was from other lake ports to Lake Superior ports. The number of passengers on boats passing the locks during the season was 55,175. The cost per ton per mile for carrying such freight averaged 92-100 of a mill, which is very low freight rate. It is estimated that the entire tonnage of the Great Lakes was approximately 55,000,000 tons, for the year 1903. South of Lake Superior lies Lake Michigan,

whose length is 320 miles, its average width is 65 miles, and it has an average depth of 385 feet. Lake Michigan flows through the Straits of Mackinac, 30 miles long and 16 miles wide, into Lake Huron, which is 363 miles long and 101 miles wide, and has a prolongation on the east known as Georgian Bay, wholly in the Dominion of Canada, and 120 miles long and 40 miles wide. Lake Huron flows through the Saint Clair River, 35 miles long and 1 mile wide, into Lake Saint Clair, which is 19 miles long and 25 miles wide. Lake Saint Clair flows into the Detroit River which is 25 miles long, and flows into Lake Erie. Lake Erie is 250 miles long, from 40 to 60 miles wide, and barely exceeding 100 feet in depth. Into Lake Erie flows the Maumee River, 200 miles long, navigable in its lower course, but paralleled by a canal extending across the State of Ohio. It also receives the Sandusky River, which flows into Sandusky Bay, which is 20 miles long and about 4 miles wide. The Sandusky River is about 125 miles long. The Cuyahoga River also flows into Lake Erie. It is between 80 and 90 miles in length and is paralleled by a canal extending across the State, but not in operation. Lake Erie empties into the Niagara River, which is about 34 miles long and 1 mile wide, and whose navigability is interrupted by the Cataract at Niagara Falls and the Whirlpool and other rapids below the Falls as far as Lewiston. A project is under consideration in Congress to construct a 22-foot ship canal from Lake Erie through the Buffalo Harbor to a point in the Niagara River below the city of Buffalo, in order to permit lake vessels of large draft to descend the river to Tonawanda. The traffic on the Niagara River to Tonawanda consists principally of lumber and iron ore. Excursion steamers navigate the Niagara within three miles of Niagara Falls, and Lake Ontario steamers ascend the lower Niagara as far as Lewiston. Niagara River flows into Lake Ontario, which is 190 miles long, 40 miles wide and has a depth of 300 feet. Lake Ontario empties into the Saint Lawrence River. The Genesee River flows into Lake Ontario, and also the Oswego and the Black. The Oswego River is to be canalized and made navigable its entire course for vessels carrying 1,000 tons. The Black River is about 200 miles long, and is paralleled by the Black River Canal in part of its course. There are several bays setting into the mainland from Lake Ontario on the south and east, such as Irondequoit, Sodus, Black River Bay, Chaumont, and Alexandria Bay, which communicates with the Saint Lawrence River, and is one of the most popular summer resorts. It has a large river commerce and many beautiful yachts frequent it during the summer months.

In northern New York are many beautiful lakes in the Adirondack region, such as Saranac, Tupper, Lake Placid, Honondaga, Fulton Chain, Chateaugay, Chazy, Clear Lake, and others. Most of these are navigated by small pleasure craft and are visited by thousands of people every year. In the Champlain Valley is Lake George, 36 miles long and from two to three miles wide. This is navigated by a line of steamers and is one of the most picturesque lakes in America. Its outlet is only five miles from Lake Champlain. Several small rivers flow into Lake Champlain and among

WATKIN — WATKINSON

these the Champlain River, the Missisquoi River and Otter Creek, which are navigable for five or six miles each for Lake Champlain vessels.

There are several hundred miles of artificial waterways in the United States, which were constructed for the purpose of navigation by vessels drawing from three to six feet of water and carrying from 75 to 300 tons of freight. Some of these have been abandoned and others have been permitted to be partially filled with silt and grown up with vegetable matter, while others have been kept in a state of good repair and active operation. At one time Pennsylvania had about 500 miles of navigable canals. The canals of Ohio, such as the Miami and Erie, the Ohio, the Walhonding and the Hocking were in active operation. All these artificial navigable waterways had an extensive commerce. The Erie, Champlain and Oswego canals of New York have carried from three and a half to six millions of tons of freight annually for upwards of 50 years. And they are now to be improved and enlarged so that they will have a maximum carrying capacity of 20,000,000 tons annually. The prism of these new canals will be 12 feet deep and 11 feet over mitre sills and have a bottom width of 75 feet. Their locks will be 328 feet long and 28 feet wide.

Alaska has its picturesque Yukon, 2,000 miles long and navigable for 1,200 miles. It has several tributaries such as the Porcupine River, Big Black River, the Birch River, the Tanana and other smaller rivers. Northeast of Bering Strait is Kotzebue Sound and southeast is North Sound. Both of these are on the western Alaska coast. South of the Yukon is Kuskokwim River, 450 miles long, and still farther south, along or near the coast, are Bristol Bay, Iliamna and Nikhkak lakes, Shelikof Strait, Cook Inlet, William Sound and Copper River, which is 150 miles long. Southern Alaska comprises several connecting waters into which flow Taku and Iskoot rivers. All Alaskan waterways are navigable during the warm summer months only, but they serve an important function as a means of reaching the interior to the gold and mineral mines of that territory. Alaska has about 3,000 miles of sea coast and many gulfs, bays and straits, in communication with the Pacific Ocean. Its commerce is growing rapidly and many boats ply between its seaport towns and among its beautiful islands, extending from Chatham Sound and Portland Canal on the east to the farthest-most Aleutian island on the west.

HENRY WAYLAND HILL,

Chairman of the Committee on Commerce and Navigation of the Senate of the State of New York.

Watkin, wôt'kîn, Sir Edward William, English railway manager: b. Northenden, Cheshire, 1819; d. London 14 April 1901. He was engaged in the warehouse of his father, a London merchant, from 1829-45, when he became secretary to the Trent Valley Railroad Company, and thenceforward continued in the railway business, becoming general manager and director in various leading companies. He was chairman of the Southeastern in 1867 and of the Metropolitan in 1872, extricating each from financial difficulties. While president of the Canadian Grand Trunk

he prosecuted negotiations which resulted in the confederation of the five British North American provinces. He was elected to Parliament for Great Yarmouth in 1857, but was unseated by petition. In 1864-8 he was member for Stockport, and for Hythe in 1874-95. He was knighted in 1868, and created a baronet in 1880. He was the chief promoter of the Channel tunnel project.

Watkins, wôt'kînz, John Elfreth, American scientist: b. Ben Lomond, Va., 17 May 1852; d. 1903. He was graduated from Lafayette College in 1871, and until 1872 was mining engineer for the Delaware & Hudson Canal Company. He was appointed curator of the United States National Museum in 1877, an office he occupied until 1892, and in 1895 became superintendent and curator of its technological collections. He wrote much concerning the development of railroad and telegraph systems, including: 'The Evolution of the Railway Passenger Car' (1888); 'History of the Pennsylvania Railroad, 1846-96' (1896), etc.

Watkins, N. Y., village, county-seat of Schuylcr County; on Seneca Lake, and on the New York Central & Hudson River (Fall Brook) and the North Central R.R.'s; about 20 miles north of Elmira. It is in an agricultural region in which are large vineyards. The Glen Springs Sanitarium is a famous salt plant, but the chief attraction is the glen. The principal manufactories are flour and lumber mills, wagon and carriage factories, and iron foundries. Several mineral springs are near by. Large quantities of grapes are shipped in the season. The village has a high school, founded in 1863, graded schools, two libraries, and two private banks. Pop. (1890) 2,604; (1900) 2,943.

Watkins' Glen, N. Y., near the village of Watkins, in Schuylcr County, a ravine noted for its picturesque scenery and its great beauty. The rocks are Devonian shale, which, during the Pleistocene period, were cut into narrow gorges by the glacial ice. The gorge here is, in places, 300 feet deep, and a narrow stream flows through forming a succession of beautiful cascades and rapids. On the slope from the crest of the elevation overlooking a most charming part of the gorge, to the village of Watkins, is a cemetery, which for natural beauty is rarely equaled. The artist, Hope, made Watkins his home for many years, and he was laid to rest in the cemetery he so much admired. Many tourists visit the glen each year.

Watkinson, wôt'kîn-sôn, David, American philanthropist: b. Lavenham, Suffolk, 17 Jan. 1778; d. Hartford, Conn., 13 Dec. 1857. He came with his parents to the United States in 1795 and was for a time engaged in a New York counting house. He established a business in Hartford with his brother William in 1800, and retired in 1841 with an immense fortune. His will bequeathed large sums to various charitable institutions and he also gave \$100,000 to the Connecticut Historical Society for a reference library.

Watkinson, William L., English Wesleyan clergyman: b. Hull, Yorkshire, 30 Aug. 1838. He became editor of the 'Wesleyan Methodist Magazine,' and of the London 'Quarterly Review,' and in 1897-8 was president of the Wesleyan Conference. He has published: 'Mistaken Signs' (1882); 'The Influence of Skepticism on

WATLALA INDIANS — WATSON

Character' (1886); 'The Transfigured Sackcloth' (1893); 'Studies in Christian Character, Work, and Experience' (1901); 'The Bane and the Antidote' (1902); etc. He has received degrees from American universities.

Watla'la Indians, a tribe of the Chinookan stock of North American Indians, who call themselves Kwikwulit, and who have also been known as Upper Chinook, Wahclellah, "Dog River, or Cascade Indians," etc. They formerly occupied the Cascades and about Dog River, which discharges into the Columbia about midway between the Cascades and The Dalles, in Wasco County, Oregon. They numbered but 80 souls in 1854; in the next year they entered into the Wasco treaty, by which they agreed to move to the Warmspring Reservation, where a few of them now are, while the others are still about the Cascades. Their language is almost identical with that of the Wasco (q.v.).

Watling (wõt'ling) **Street**, England, one of the great Roman roads, commencing at Dover, passing through Canterbury and Rochester to London, and thence to Chester and York, and north in two branches to Carlisle and the Wall in the neighborhood of Newcastle. Traces of the ancient road are still found in many parts of its course, and in some it is still an important highway; a street in London retains its name. It was the line of division in the treaty between Alfred and Guthrum the Dane, and it is still the boundary between Warwickshire and Leicestershire. Of the origin of Waetling nothing is now remembered; it is supposed to be a corruption of Stratum Vitellianum; a trace also survives in the name Wattlesborough, a place on Watling street near Wroxeter (Uriconium).

Watlings (wõt'lingz) **Island**, one of the Bahamas, British West Indies, lying 220 miles northeast of Cuba. It is 18 miles long and has a lagoon near the centre. It is fertile, but sparsely inhabited. It is now generally admitted to be the first landing place of Columbus, called by him San Salvador. The native name was Guanahani.

Watseka, wõt-sē'ka, Ill., city, county-seat of Iroquois County; on the Iroquois River, and on the Chicago & E. I. and the Toledo, P. & W. R.R.'s; about 70 miles south of Chicago and 100 miles east of Peoria. It is in an agricultural and stock-raising region. The chief manufacturing establishments are flour and grist mills, planing mills, knitting mills, tile works, and machine shops. There are seven churches, public elementary schools, and two banks, capitalized for \$100,000, with deposits amounting to \$536,100. Pop. (1890) 2,017; (1900) 2,505.

Watson, wõt'son, **Alfred Augustus**, American Protestant Episcopal bishop: b. New York 21 Aug. 1818. He was graduated from the University of New York in 1837, studied law and in 1841 was licensed to practise in the New York Supreme Court. He then turned his attention to theology, and in 1845 took priest's orders in the Episcopal Church. During the Civil War he served as chaplain in the Confederate army, and in 1884 was consecrated bishop of East Carolina.

Watson, **David T.**, American lawyer: b. Washington County, Pa., 2 Jan. 1844. He was graduated from Washington and Jefferson College in 1864, studied law at Harvard for two years, was admitted to the bar and has since

successfully engaged in law practice in Pennsylvania. In 1903 he was chosen one of the three counsel for the United States before the Alaskan Boundary Commission.

Watson, **Elkanah**, American agriculturist: b. Plymouth, Mass., 22 Jan. 1758; d. Port Kent, N. Y., 5 Dec. 1842. He was apprenticed at 15 to John Brown of Providence, founder of the famous mercantile firm, and when 19 was intrusted by him with \$50,000 to be invested in cargoes for the markets of Europe. He made the journey to Charleston successfully and his journal, subsequently published, is the best existing account of the principal towns of the colonies at the time of the Revolution. He opened a branch house in Nantes, France, in 1779, meeting with much success for three years, when he lost his property through the crash of French finances. He returned to America in 1784, engaged in trade between South Carolina and Haiti until 1788, and in 1789 removed to Albany, where he was an active promoter of public enterprises. He projected an internal canal for New York State, founded the Albany Bank, organized the first agricultural society in New York, aided the establishment of western stage routes, and was an earnest worker for improved educational advantages. He removed to Port Kent on Lake Champlain in 1828. He published: 'Tour in Holland' (1790); 'History of Western Canals in the State of New York' (1820); 'History of Agricultural Societies' (1820). Consult Winslow C. Watson, 'Men and Times of the Revolution, or Memoirs of Elkanah Watson,' chiefly autobiographical (1855).

Watson, **George Lennox**, English naval architect: b. Glasgow 30 Oct. 1851. After a five-years' connection (1867-71) with shipbuilding firms he established himself in Glasgow in 1872 as a naval architect. His first success was made in 1873 with the racing yacht Clotilde. Subsequently he has designed more than 400 vessels, including, besides racing yachts, passenger, mail, and cargo steamers, and some of the largest steam yachts afloat. Among his racing yachts were Vanduara (for John Clark of Paisley); the cutter Britannia (for the Prince of Wales, now Edward VII.), and the Thistle, Valkyrie II., and Valkyrie III., competitors for the America's cup.

Watson, **Henry Brereton Marriott**, English novelist: b. Caulfield, Melbourne, Australia, 20 Dec. 1863. Graduated from Canterbury College (Christchurch) in 1883, he went in 1885 to England, where he took up journalism in 1887. He wrote much for the 'National Observer' and was assistant editor of 'Black and White' and the *Pall-Mall Gazette*. Among his works are: 'Marahuna' (1888); 'The Web of the Spider' (1891); 'The Adventurers' (1898); 'The Skirts of Happy Chance' (1901); 'The House Divided' (1901); 'Godfrey Merivale' (1902); and 'Alarms and Excursions' (1903). With J. M. Barrie he was joint-author of the drama 'Richard Savage.'

Watson, **James Craig**, American astronomer: b. Fingal, Ontario, 28 Jan. 1838; d. Madison, Wis., 23 Nov. 1880. He was graduated from the University of Michigan in 1857, was appointed professor of astronomy there in 1859, and in 1879 accepted the chair of astronomy at

WATSON

the University of Wisconsin. He accompanied the eclipse expeditions to Iowa in 1869 and to Sicily in 1870, and was in charge of the expedition to Peking, China, for the observation of the transit of Venus in 1874. He was the discoverer of 23 asteroids, and of several comets, receiving the Lanlade medal from the Paris Academy in 1870 for the discovery of six asteroids in one year. In 1867 he was elected to the National Academy of Sciences, an institution to which he bequeathed \$16,000 for a research fund and the "Watson medal." He published: 'Popular Treatise on Comets' (1860); 'Theoretical Astronomy' (1868); 'Tables for Calculation of Simple and Compound Interest and Discount' (1879); etc.

Watson, John, Canadian philosopher: b. Glasgow, Scotland, 25 Feb. 1847. He was graduated from Glasgow University in 1872 and in the same year was called to the chair of mental and moral philosophy at Queen's University, Kingston, Ont. He has published 'Kant and His English Critics' (1881); 'Schelling's Transcendental Idealism: a Critical Exposition' (1882); 'The Philosophy of Kant as Contained in Extracts from His Own Writings' (1888); 'Comte, Mill, and Spencer, an Outline of Philosophy' (1895); 'Hedonistic Theories, from Aristippus to Spencer' (1895); 'Christianity and Idealism' (1896); 'An Outline of Philosophy with Notes Historical and Critical' (1898).

Watson, John ("IAN MACLAREN"), English Presbyterian clergyman and author: b. Manningtree, Essex, 3 Nov. 1850. He was educated at Edinburgh University, New College (Edinburgh), and the University of Tübingen, was licensed to preach by the Free Church of Scotland in 1874, and appointed assistant minister of the Barclay Church, Edinburgh. In 1875 he was ordained minister of Logiealmond (Perthshire) Free Church, whence he went in 1877 to Free Saint Matthew's, Glasgow, and in 1880 to the Sefton Park Presbyterian Church of Liverpool. He was Lyman Beecher lecturer at Yale in 1896, and in 1900 moderator of the synod of the Presbyterian Church of England. Among his religious works, whose style is in general that of discourses in essay form, are 'The Upper Room' (1895); 'The Mind of the Master' (1896); 'The Potter's Wheel' (1897); 'Companions of the Sorrowful Way' (1898); 'Doctrines of Grace' (1900); and 'The Life of the Master' (1901). He also published several works of fiction, beginning with 'Beside the Bonnie Brier Bush' (1894), a very successful collection of sketches of life and character in Highland and semi-Highland parishes, and including further 'The Days of Auld Lang Syne' (1895), 'Kate Carnegie' (1896), 'A Doctor of the Old School' (1897), 'Afterwards' (1898), and 'Rabbi Saunderson' (1898).

Watson, John Crittenden, American naval officer: b. Frankfort, Ky., 24 Aug. 1842. He was graduated from the United States Naval Academy in 1860, was promoted master in 1861, and assigned to the Sabine. He was transferred to the Hartford, flagship of Admiral Farragut, in 1862, and served under him throughout the war. He participated in the battles of Fort Jackson and Saint Philip, served in the passage of the Vicksburg batteries in 1862, of Fort Hudson in 1863, and was engaged at Mobile Bay in 1864. He received rank as lieutenant-commander in

1866, as commander in 1874, and in 1877-80 was in command of the Wyoming. He was light-house inspector in 1880-6, promoted captain in 1887, and commodore in 1897. In the Spanish-American War of 1898 he commanded the blockading squadron on the northern coast of Cuba, was transferred to the command of the Oregon later in that year, and in 1899 succeeded Admiral Dewey in charge of the Asiatic squadron at Manila, with rank as rear-admiral. In 1900-2 he was president of the Naval Examining Board, and since then has been president of the Examining and Retiring Board.

Watson, John Fanning, American antiquary: b. Batsto, N. J., 1780; d. Germantown, Pa., 23 Dec. 1860. He was a bookseller in Philadelphia for many years and made a careful study of early and Revolutionary history. His publications include: 'Annals of Philadelphia' (1830); 'Historic Tales of the Olden Times in New York' (1832); 'Annals of New York City and State' (1846); 'History of the United States' (1856).

Watson, Musgrave Lewthwaite, English sculptor: b. Hawkdale, Cumberland, near Carlisle, 1804; d. London 28 Oct. 1847. Meeting Flaxman in London in 1823 he gained the friendship of that sculptor, through whose influence he was admitted to the schools of the Royal Academy. He subsequently visited Rome, working under Chantrey (q.v.) and Behnes. His productions include a terra cotta relief, 'Suffer Little Children to Come Unto Me'; and statues of Flaxman, Nelson, Chaucer, and Queen Elizabeth.

Watson, Paul Barron, American author: b. Morristown, N. J., 25 March 1861. He was graduated from Harvard in 1881, subsequently studied law and was admitted to the bar, and has practised in Boston. His published writings are a 'Bibliography of the Pre-Columbian Discoveries of America,' privately printed in 1881, and included in the 4th (enlarged) edition of 'America Not Discovered by Columbus,' by R. B. Anderson (q.v.); 'Marcus Aurelius Antoninus' (1884), the first extended biography of the subject in English; and 'The Swedish Revolution under Gustavus Vasa' (1889).

Watson, Richard, English Anglican prelate: b. Heversham, Westmoreland, August 1737; d. Calgarth Park, Westmoreland, 4 June 1816. He was graduated from Trinity College, Cambridge, in 1759, became professor of chemistry there in 1764, and in 1771 was appointed regius professor of divinity. He became archdeacon of Ely in 1780, and in 1782 was consecrated bishop of Llandaff. His writings include: 'An Apology for Christianity' (1776); 'Chemical Essays' (5 vols., 1781-8); 'An Apology for the Bible' (1796); etc. Consult his son Richard: 'Anecdotes of the Life of Richard Watson' (1817).

Watson, Richard, English Methodist clergyman: b. Barton-upon-Humber, Lincolnshire, 22 Feb. 1781; d. London 8 Jan. 1833. He joined the Wesleyan Methodists at 15 and began preaching. He was ordained in 1800, and shortly afterward joined the Methodists of the New Connection, returning to the Wesleyans in 1812. He was appointed secretary of the Wesleyan Missionary Society in 1817, and in 1826 was president of the conference. He was for a time editor of the Liverpool *Courier* and wrote:

WATSON

'Apology for the People Called Methodists' (1800); 'Life of the Rev. John Wesley' (1831); 'A Biblical and Theological Dictionary' (1831); 'An Exposition of the Gospels of Matthew and Mark' (1833); etc. His collected works were edited by Thomas Jackson, in 13 vols., 1834-7, with 'Memoir.'

Watson, Robert Spence, English publicist and lawyer: b. Gateshead 8 June 1837. He was educated at University College, London, and established a law practice in Gateshead and Newcastle. He was president of the National Liberal Federation in 1890-1902, and has taken an active part in educational movements in Newcastle. He is also known for his writings on economic subjects, particularly the labor question. His publications include 'Industrial Schools' (1867); 'Higher Education in Boroughs' (1868); 'The History of English Rule and Policy in South Africa' (1879); 'Irish Land Law Reform' (1881); 'The Relations of Labor to Higher Education' (1884); 'Boards of Conciliation and Arbitration and Sliding Scales' (1886); 'The Peaceable Settlement of Labor Disputes' (1889); 'Labor, Past, Present, and Future' (1889); 'The Recent History of Industrial Progress' (1891); and 'The Duties of Citizenship' (1895).

Watson, Sereno, American botanist: b. East Windsor Hill, Conn., 1 Dec. 1826; d. Cambridge, Mass., 9 March 1892. He was graduated from Yale in 1847, studied medicine at the University of New York, and in 1867-9 was botanist to the government exploration of the 40th parallel under Clarence King (q.v.). In 1871 he became assistant curator at the Gray Herbarium at Harvard, and from 1874 until his death was curator there. He was elected fellow of the National Academy of Sciences in 1889. Among his publications are: 'Botany,' Vol. V. of 'Reports on the Geological Exploration of the 40th Parallel' (1871); 'Bibliographical Index to North American Botany, Part I., Polypetalæ' (1878); with W. H. Brewster and Asa Gray, 'Botany of California' (2 vols., 1876-80); etc.

Watson, Thomas, English poet: b. London about 1557; d. 1592. While his fame may seem to have been eclipsed by that of Spenser and Sidney, among his contemporaries he was equally popular for his pastoral and love poetry. He lived in a learned age and translated the 'Antigone' of Sophocles into very elegant Latin. His 'Melibœus, Thomæ Watsoni; seu, Ecloga in Obitum Domini Francisci Walsinghami, Equitis Aurati' (1590) was a graceful Vergilian tribute to the memory of the statesman and diplomat Francis Walsingham (q.v.). His sonnets, 'Tears of Fancie; or Love Disdained,' evidently gave suggestions to Shakespeare in the composition of his 'Sonnets.' Consult Arber, 'English Reprints' (1892).

Watson, Thomas Edward, American lawyer and politician: b. Columbia County, Ga., 5 Sept. 1856. He entered Mercer University but did not complete the course there, and then took up the study of law and was admitted to the bar in 1875. He began the practice of his profession at Thompson, Ga., and rapidly attained a reputation as one of the leading lawyers of the State. In politics he was at first a Democrat; was elected to the State legislature in 1882, and served as Democratic elector-at-large in 1888.

He was active in the Farmers' Alliance movement, and finally affiliated himself with the People's Party; in 1890 he was elected to Congress on the Populist ticket, and for some time edited a Populist paper at Atlanta. While in Congress he obtained the first appropriation for the rural free delivery of mail. In 1896 he was the nominee of the People's Party for vice-president. Since then he has devoted himself to his law practice, and to historical writing. His publications include 'The Story of France' (1898); 'Life of Napoleon' (1902); and 'Life and Times of Thomas Jefferson' (1903).

Watson, William, American scientist: b. Nantucket, Mass., 19 Jan. 1834. He was graduated from the Lawrence Scientific School of Harvard in 1857; was an instructor there in 1857-9; in 1859-63 was in Europe collecting information on technical education, which, when communicated to W. B. Rogers, was made the basis of the organization of the Massachusetts Institute of Technology; and from 1865 to 1873 was professor of mechanical engineering and descriptive geometry in that institution. In 1884 he was elected secretary of the American Academy of Arts and Sciences. In addition to numerous technical papers, he has published various writings, including: 'Technical Education' (1872); 'Course in Descriptive Geometry' (1873); 'Courses in Shades and Shadows' (1889); 'The Civil Engineering, Architecture, and Public Works of the Paris Exposition of 1889' (1891); and 'The International Water Transportation Congress, Chicago, 1893' (1894).

Watson, William, English poet: b. Burley-in-Wharfedale, Yorkshire, 2 Aug. 1859. He was privately educated, and in 1880 published his first volume of verse, 'The Prince's Quest, and Other Poems,' which showed the influence of Keats and William Morris, and found favor with Rossetti. In 1884 he issued his 'Epigrams of Art, Life, and Nature,' containing much highly-finished work, but it was not till the publication of 'Wordsworth's Grave, and Other Poems,' in 1890, that he gained adequate recognition. The volume of his 'Poems' published in 1892 was a reprint of the 1890 volume with the addition of 26 new pieces. Of 'Lachrymæ Musarum, and Other Poems' (1892), the title-poem is a fine eulogy of Lord Tennyson. 'The Eloping Angels' followed in 1893, 'Odes, and other Poems,' in 1894, and 'The Father of the Forest, and Other Poems,' in 1895. To 1896 belong two volumes of sonnets on the Armenian atrocities, with the titles 'The Year of Shame' and 'The Purple East'; to 1897, 'The Hope of the World, and Other Poems.' His 'Collected Poems' (1898) ought rather to be called 'Selected Poems,' since from them are excluded all of the 1880 and 1893 volumes, more than half of the 'Epigrams,' most of 'The Year of Shame,' and portions of the other volumes. He wrote in 1902 one of the more prominent odes on the coronation of Edward VII., and in 1903 'For England.' He has written in prose a volume of literary essays, 'Excursions in Criticism' (1893). Watson's work is carefully wrought, reflective in tone, and marked by an air of distinction. It has been sometimes criticised as occasionally too closely an echo of greater poets. He was prominently mentioned as a possible successor to Tennyson in the laureateship.

JAMES WATT.

WATSONVILLE — WATTEAU

Watsonville, wõt'són-vil, Cal., city in Santa Cruz County; on the Pajaro River, and on the Southern Pacific Railroad; about five miles from Monterey Bay, an arm of the Pacific Ocean, and 18 miles southeast of Santa Cruz. It is in an agricultural and fruit-growing region. Sugar beets are one of the chief products grown in the vicinity. The principal manufacturing establishment is the sugar beet factory; which has a beet-crushing capacity of over 1,000 tons and a sugar manufacturing capacity of over 200 tons each day. There are four state banks, capitalized for \$180,000, and with deposits amounting to \$1,468,000. Pop. (1890) 2,885; (1900) 3,085.

Watt, wõt, James, Scottish engineer: b. Greenock, Renfrewshire, 19 Jan. 1736; d. Heathfield, near Birmingham, Staffordshire, 25 Aug. 1819. Having determined to adopt the trade of mathematical instrument maker, he spent a year in London learning the art, in which he attained great dexterity, and after his return endeavored to set himself up in business in Glasgow. In this he might not, perhaps, have succeeded, owing to the opposition of other workers in the trade, had he not been appointed (1757) mathematical instrument maker to the university, which was outside of the jurisdiction of the Glasgow municipality. While thus employed he was also active in preparing surveys and reports in connection with canal, river, and harbor work. It was during this period that he thought of and completed most of his improvements of the steam-engine. The idea of a separate condenser first occurred to him in 1764, and in January 1769 he took out the patent for the improvements of the steam-engine in which this idea was applied. Previous to Watt's time, the cylinder itself had been used as a condenser, and the jet of cold water introduced into the cylinder to condense the steam so reduced the temperature of the cylinder that three times as large a supply of steam (so Watt estimated) was demanded as was really needed. Watt, therefore, set to work to condense the steam in a separate receptacle. The change was so important as to make him almost the inventor of the modern engine. But it was not till the year 1774 that he united with Matthew Boulton (q.v.), a manufacturer at Birmingham, in order to carry his improvements into execution. In consequence of this he removed to Soho, near Birmingham, where the establishment in which his steam-engines were manufactured soon acquired a European fame. He retired from the business in 1800, when his patent, which had been renewed in 1775 for 25 years, expired. Watt was a fellow of the Royal Societies both of London and Edinburgh, and one of the few natives of Great Britain who have been elected members of the National Institute of France. Besides the expedient of the condenser, Watt made also other improvements in the steam-engine. He devised the sun-and-planet gear wheel, made use of the expansion principle to obtain the double engine, applied the governor to the regulation of the speed of steam-engines. He also patented a fuel-saving furnace, invented copying ink, and independently discovered the chemical composition of water. He had a powerful memory, and the range of his reading was very wide. Chemistry, architecture, music, law, metaphysics, and language were the principal subjects which,

in addition to physical science and its practical applications, engaged his attention, and in all of them his knowledge was wonderfully extensive, minute, and accurate. For an account of the improvements that Watt effected in the steam-engine see STEAM-ENGINE. The significance of his work places him among the foremost of inventors. Consult further: Muirhead, 'Origin and Progress of the Mechanical Inventions of James Watt' (1854); a 'Life' abridged from the preceding (1858); Smiles, 'Lives of Boulton and Watt' (1865); Thurston, 'The Growth of the Steam-Engine' (1879); and an article by Cowper in the 'Transactions' of the Institution of Mechanical Engineers for 1883.

Watt, in electricity, the unit of activity or rate of doing work. It is measured by the product of the voltage or electromotive force of the source into the current supplied. Thus a dynamo which is yielding 30 amperes at a voltage of 100 is working with an activity of 3,000 watts. The watt is equal to 0.735 foot-pound per second; so that one horse-power per second is equal to 746 watts. It is customary to use the kilowatt as the practical unit. See OHM; UNIT; VOLT.

Watteau, vâ-tô, Jean Antoine, French painter: b. Valenciennes 10 Oct. 1684; d. Nogent-sur-Marne 18 July 1721. His parents, whose situation in life was humble, with difficulty contrived to give him the instructions of a very inferior master in the country. In 1702 he went to Paris, in company with a scene-painter, with whom he continued to work for a few months. Soon after he found employment with one Claude Gillot, who, although only a painter of decorations for ballets, and a designer of costumes and of patterns for tapestry, was a true artist. With him he found an opportunity of practising in all these branches of art, and when he left him he found another master in Claude Audran, a very able man, keeper of the Luxembourg, who was of great service to him in opening to him the famous gallery of the palace in which Rubens had painted in allegory the history of Marie de Médicis. From the study of the great Flemish master he improved his coloring, and when he left Audran 1709 he was a consummate master of his art and a painter of "Fêtes Galantes." He now began to paint on his own account, but met at first with little encouragement. He failed to secure the "Prix de Rome," which would have enabled him to visit Italy, but soon afterward scored a triumph by his 'Un Départ de Troupes.' He was admitted to the Académie in 1717 as a painter of "Fêtes Galantes," and produced many pictures whose power and grace in drawing and coloring his rivals strove in vain to emulate. His subjects were all genre, military, and civil. He excelled in reproducing the costumes, airs, and graces of the fashionable world of his time. His 'L'occupation selon l'Age' sold in 1891 for \$27,300. A year or two before his death he went to England, in order, it is said, to consult a certain Dr. Meade regarding his health, which was never robust. He remained a year, and seems to have received more injury to his health from the English climate than benefit from the doctor's prescriptions and returned to France only to die in the arms of his friend Gersaint.

WATTERSON — WATTS

teau' (1875); Pater, 'A Prince of Court Painters' (in 'Imaginary Portraits,' 1887).

Watterson, wŏt'ér-sŏn, **Henry**, American journalist: b. Washington, D. C., 16 Feb. 1840. He was privately educated, and began journalistic work as editorial writer for the *Washington Star*. In 1861 he joined the Confederate army as a private, and later was aide-de-camp to Generals Forrest and Polk. In 1862 he withdrew from the army to edit the *Rebel* at Chattanooga, a daily paper, recognized as an organ of the Confederate government, but in 1864 returned to the army, and had part in Gen. Johnston's campaign, and the siege of Atlanta. After the war he revived the publication of the *Nashville Republican Banner*; and in 1867 became editor of the *Louisville Journal*. This paper he united with the *Courier*, under the name of the *Courier-Journal*, of which he became editor-in-chief and which he has made one of the leading Southern newspapers. He has been active in politics as a member of the Democratic party; was delegate-at-large to every Democratic National Convention from 1872-92, and was permanent chairman of that of 1876. He was a member of Congress in 1876-8. Though a staunch supporter of Tilden for the presidency, yet in Congress he was one of the leaders in obtaining a peaceable adjustment of the election dispute, and approved the appointment of the Electoral Commission (q.v.). In 1896 he refused to support the Chicago platform of the Democratic Party, and was affiliated with the Gold Democrats. As speaker and editor he has been a consistent advocate of free trade, and particularly of a policy of conciliation between the North and the South. He has published 'Oddities of Southern Life and Character' (1882); 'History of the Spanish-American War' (1899); and 'Abraham Lincoln' (1899).

Wattle-bird, or **Wattle-crow**, an Australian honey eater (*Anthochaera carunculata*), so named from the large reddish wattles on its neck. It is about the size of a magpie, and is of bold, active habits.

Wattles, arborescent shrubs (*Acacia*) of Australia and Tasmania, in some places growing to good-sized trees. They have foliage which is compound or reduced to phyllodia, and pretty, crowded flowers, in globose or cylindrical heads. The wattles furnish a gum, used as an adhesive in cotton-printing; the stems make poles, which are serviceable for many "bush" purposes. The bark is a valuable tanning material, known as mimosa- or wattle-bark, and many of the acacia forests have been killed by the stripping of their cortex for this purpose. A good quality of tan-bark is obtained from *A. decurrens* and *A. mollissima*, the black, green, or feathered wattle found also in South Africa. It is one of the most graceful of the acacias, and least destructive of this thorny race to person and clothing. The silver wattle (*A. dealbata*) is a taller tree than the black wattle, with ashen-tinted young foliage. The African wattle is *A. natalitia*; the Alpine, *A. pravissima*, from the Victorian Alps. *A. juniperina*, the prickly wattle, is an evergreen shrub of Australasia. The raspberry-jam wattle (*A. acuminata*) of the same region, yields a cabinet wood, having the odor of that sweetmeat. The wallaby- (*A. rigens*) and varnish-wattle (*A.*

verniciiflua), are also Australian shrubs. The soap-pod wattle is the same as the soap-nut (q.v.) of India. Savannah wattles are West Indian trees (*Citharexylum quadrangulare* and *C. cinerea*) of the verbenia family.

Watts, wŏts, **George Frederick**, English painter: b. London 23 Feb. 1817. He studied in the schools of the Royal Academy and in 1837 exhibited at the Royal Academy two portraits of young ladies and a subject-picture entitled 'The Wounded Heron,' and since then has contributed to various art exhibitions, notably the Royal Academy, the Grosvenor Gallery, and the New Gallery, about 300 pictures of various kinds. Some of these are landscapes and seascapes; a few, such as 'The Sempstress' and 'Under the Arch,' portray contemporary life; but the finest and most characteristic are portraits and allegorical or ideal subjects. His portraits include those of the most eminent men and women of his age, and perhaps form his chief claim to renown, as they were the basis of his reputation as an artist. Of his other pictures the following may be mentioned: 'Isabella Finding Lorenzo Dead' (1840); 'Paolo and Francesca' (1848); 'Orlando Pursuing the Fata Morgana' (1848); 'Life's Illusions' (1849); 'Sir Galahad' (1862); 'The Wife of Pygmalion' (1868); 'The Return of the Dove to the Ark' (1869); 'Daphne' (1870); 'Fata Morgana' (1870); 'The Curse of Cain' (1872); 'The Prodigal' (1873); 'Dedicated to all the Churches' (1875); 'The Dove that Returned not Again' (1877); 'Love and Death' (1877); 'Time and Death' (1878), like the preceding, one of his most notable pictures; 'Orpheus and Eurydice' (1879); 'Paolo and Francesca' (1879); 'Psyche' (1880); 'The Rider on the Pale Horse,' 'The Rider on the Black Horse,' 'The Rider on the Red Horse,' and 'The Rider on the Red Horse,' all apocalyptic pictures of 1883; 'Love and Life' (1884); 'Rain Passing Away' (1884); 'The Angel of Death' (1888); 'The Wife of Plutus' (1889); 'She Shall be Called Woman' (1892), a large picture of Eve; 'For He Had Great Possessions' (1894); 'The Outcast' (1895); 'Jonah' (1895); 'Eve Tempted' and 'Eve Repentant' (1896); 'Love Triumphant' (1898); 'Court of Death' (1902). He was in Italy during 1843-7, and was powerfully influenced by Titian and Tintoretto. In 1847 his colossal oil-pictures of 'Echo' and 'Alfred inciting the Saxons to prevent the Landing of the Danes' were awarded a prize of £500 in another Westminster Hall competition. The latter of these now adorns a committee room of the Houses of Parliament. He completed a fresco, 'St. George Overcomes the Dragon,' in 1853, for the Houses of Parliament, and at a later date painted in fresco the west end of the new hall at Lincoln's Inn. Since 1896 he has been on the list of retired academicians. A large number of his portraits, presented by him to the nation, are now in the National Portrait Gallery, and some of his best allegorical paintings were presented to the National Gallery of British Art (Tate Gallery). To use his own words, he paints ideas rather than objects, and the poetic idealism to which he has been faithful throughout all his long career stands in the way of extensive popularity. His drawing is of the utmost correctness and his coloring often extremely

WATTS — WAUKEGAN

fine, but while his allegorical subjects are often great in conception and treatment they sometimes require too much literary exposition to appeal to the ordinary picture lover in a clear and direct manner. Consult Monkhouse, 'British Contemporary Artists' (1889); Bateman, 'G. F. Watts' (1901); Chesterton, 'G. F. Watts' (1904).

Watts, Isaac, English Congregational divine: b. Southampton 17 July 1674; d. Stoke, Newington, London, 25 Nov. 1748. He was educated for the ministry at an academy in Stoke-Newington. In 1696-1702 he was a private tutor, in 1699-1702 was assistant to Isaac Chauncy, minister of the Congregational chapel in Mark Lane, London, and in 1702 succeeded to the pastorate. The congregation here was a distinguished one. Watts remained nominally pastor until his death, though from 1713 ill-health frequently interrupted his ministry, and Samuel Price was made co-pastor. Watts had in his own time great popularity as a writer, his manuals of religious instruction and his works of popular divinity having large circulation; while his 'Horæ Lyricæ' (1706) admitted him to Johnson's 'Lives of the Poets' and was reprinted in 1834 in a series of 'Sacred Classics' with a memoir by Southey, and his hymns, numbering in all about 600, were the chief part of the psalmody of English Nonconformist congregations. At the beginning of the 18th century only a few unimportant hymns had been written for Dissenters' use, the rule of Calvin having permitted only canticles and metrical Psalms. The dearth of suitable tunes and the custom of "lining out" hampered Watts' work; he had, too, many defects in rhyme and diction, was at times rhetorical and at others prosaic. But his best hymns are among the finest in English. Many are found in all hymn-books, and about a dozen remain in very general use. A collection was made in 1707, a second edition appearing in 1709. He published in 1722-4 doctrinal treatises of an Arian tendency, but grounds are wanting for believing that he finally passed to that position. His 'Works' were edited by Jennings and Doddridge in 1753; the 'Posthumous Works' were published in 1779. The former were reprinted with additions, and a memoir by Burder, in 1810. Consult further: Gibbons, 'Memoirs' (1780); Milner, 'Life' (1834); Hood, 'Life' (1875); Julian, 'Dictionary of Hymnology' (1892).

Watts, Thomas Hill, American politician: b. Butler County, Ala., 3 Jan. 1819; d. Montgomery, Ala., 16 Sept. 1892. He was graduated from the University of Virginia in 1840, established a law practice in Greenville, Ala., was elected to the State legislature in 1842, 1844-5, and to the State senate in 1853. He opposed the secession movement, but upon the secession of Alabama accepted the situation. He was appointed colonel in the Confederate army and fought at Shiloh, but resigned shortly afterward to become attorney-general in the Confederate cabinet. He was elected governor of Alabama in 1863, but was unseated by the Federal government at the close of the war. He was thereafter engaged in law practice at Montgomery, and with the exception of 1880-1, when he served in the legislature, held no further public office.

Watt's Dyke. See OFFA'S DYKE.

Watts-Dun'ton, Theodore, English poet, critic, and novelist: b. St. Ives, Huntingdonshire, 1836. He was educated privately at Cambridge and for a time studied law, but had already gained a reputation as a writer of sonnets when he joined the staff of the 'Examiner' as literary and art critic. On leaving the 'Examiner' he joined the 'Athenæum' staff, and for many years has been one of the chief contributors to that review, his criticisms of poetry being of the most illuminating character. In 1897 he published a poem entitled 'Jubilee Greeting at Spithead to the Men of Greater Britain,' which met with wide appreciation; and in the same year collected in 'The Coming of Love, and Other Poems,' some of the more important of his poetical contributions to the 'Athenæum' and other literary journals. 'Aylwin,' a novel or romance published in 1898 (privately printed 1883), forms a striking prose counterpart to 'The Coming of Love,' and contains excellent pictures of gypsy life. Watts-Dunton has also contributed largely to the 'Nineteenth Century' and other periodicals. Several of the notices in Ward's 'English Poets' are from his pen, and the valuable critical article on poetry in the 'Encyclopædia Britannica' was written by him. Later publications are: 'The Christmas Dream' (1901), and 'The Renaissance of Wonder' (1902). On occasion Watts-Dunton makes free use of the Romany dialect, which he has carefully studied. His best work is probably the critical, especially that dealing with the principles of verse. Consult: Miles, 'Poets and Poetry of the Century,' Vol. IV. (1901); also an article in the 'Idler,' Vol. V., and one by Nicoll in the 'Contemporary,' Vol. LXXIV.

Waugh, wā, Arthur, English author: b. Midsomer Norton, Somerset, 24 Aug. 1866. He was graduated from Oxford in 1889, became a journalist in London in 1890, was London correspondent of the New York 'Critic' in 1893-7, and in 1894 was sub-editor of the London 'New Review.' He acted as literary adviser to Kegan Paul and Company in 1895-1902, and is now managing director of the London publishing firm of Chapman & Hall. He has written: 'Gordon in Africa' (1888); 'Alfred, Lord Tennyson, a Study' (1892); 'Legends of the Wheel' (1898); etc.; and has edited: Johnson's 'Lives of the Poets' (6 vols., 1896); Biographical edition of Dickens (19 vols., 1902-3); and other works.

Waukegan, wā-kē'gan, Ill., city, county-seat of Lake County; on Lake Michigan, and on the Chicago & N. W.; the Elgin, J. & E. (Belt Line) R.R.'s; 35 miles north of Chicago, and 50 miles south of Milwaukee. There are two electric lines which connect the city with the lake ports and near-by villages and towns. The city is on a bluff about 80 feet above the lake. There is a fine beach and a good harbor, which has been improved, thus giving Waukegan the advantages of the lake traffic. It is in an agricultural region, but the city is best known for its manufacturing industries. The chief industrial establishments are steel and wire works, which have about 2,000 employees; sugar refineries, 1,600 employees; brass and iron works, 200; tannery, 100; wood-working factory, 150; wrapper factory, 75; roofing material works, 50; electric scale works, 100;

WAUKESHA — WAUSAU

brewery, 50; and organ-stop factory, 50. The battery company employs about 75 persons, and the coal and dock company about 100. The increase in the manufactories and the number of employees since 1900 shows the growth of the industrial interests of the city. In 1900 (government census) there were 102 manufacturing plants, capitalized for \$3,143,918, and employing 1,990 persons, to whom were paid annually \$835,882. The average annual cost of material used was \$2,990,193, and the value of the products, annually, was \$4,609,190. The city ships large amounts of lumber, coal, salt, iron, grain, and manufactured products. The principal public buildings are the county court-house, the municipal buildings, the Jane McAlister Hospital, the library, the churches, and the schools. There are 15 churches, a high school, public and parish elementary schools, and the Carnegie Public Library. The three banks, one national and two state, have a combined capital of \$200,000, and deposits (Jan. 1903) amounting to \$2,086,210. The government is vested in a mayor and a board of aldermen of 10 members, elected biennially.

The place was settled in 1835 by Thomas Jenkins; was incorporated in 1849, and chartered as a city in 1859. Pop. (1890) 4,915; (1900) 9,426.

W. L. FARMER,
Editor 'Gazette.'

Waukesha, wâ'kê-shâ, Wis., city, county-seat of Waukesha County; on the Fox River, and on the Chicago, M. & St. P., the Chicago & N. W., and the Wisconsin C. R.R.'s; about 18 miles from Lake Michigan, and 98 miles north of Chicago. It was settled in 1834 by Morris D. Cutter. It was incorporated in 1855 and in 1896 was chartered as a city. There are electric railways connecting the city with Milwaukee and with Pewaukee Lake. The city is in an agricultural region, and near by are quarries of dolomite stone much used in buildings. There are here magnesian springs which are noted for their medicinal properties. The waters are bottled for several markets. The chief manufactures are steel and iron products, bottles, beer, flour, and lumber products. There are railroad shops and machine shops. There are nine churches. The educational institutions are Carrol College (Presb.), State Industrial School, a high school, established in 1890, graded public school, Roman Catholic and Lutheran parish schools, and the Carnegie Public Library. The two banks have a combined capital of \$200,000, and the annual business is over \$2,000,000. The government is vested in a mayor and a council of 10 members, who are elected biennially.

H. M. YOUNG,
Editor 'Freeman.'

Waukon, wâ-kôn', Iowa, town, county-seat of Allamakee County; on the Chicago, Milwaukee & Saint Paul Railroad; about 80 miles north by west, in direct line, from Dubuque. It is in an agricultural, fruit growing, and stock-raising region. It has flour mills, creameries, wagon factories, canning factory, machine shop, grain elevator, and stock-yards. There are seven churches, a high school, public and parish elementary schools, a business college, and a public library. There are three banks, having a combined capital of \$115,000 and deposits amounting to \$627,550. Pop. (1890) 1,610; (1900) 2,153.

Waul, wâl, **Thomas Neville**, American lawyer: b. Sumter District, S. C., 3 Jan. 1813. He was educated at Columbia College, was licensed to practise law in 1834, and engaged in that profession in Mississippi until 1850, when he removed to Gonzales County, Texas. He served in the Provisional Congress of the Confederate States in 1861-2, recruited in the first year of the war 2,000 troops known as "Waul's Legion," received commission as their colonel, and served through the war. He was a member of the Texas Reconstruction Convention in 1865, and afterward engaged in law practice at Galveston, Texas, until 1896, when he retired.

Waupaca, wâ-pâ'ka, Wis., city, county-seat of Waupaca County; on the Waupaca River, and on the Wisconsin Central Railroad; about 133 miles northwest of Milwaukee and 38 miles northwest of Oshkosh. It is in an agricultural and stock-raising region. It has excellent water-power, and many attractions which make it a favorite summer resort. The climate is cool in summer and in the vicinity are a number of small picturesque lakes. The chief manufacturing establishments are flour mills, lumber and woolen mills, machine shops, and potato starch factories. It has the State Soldiers' Home, public graded schools and four churches. The two banks have a combined capital of \$100,000. Pop. (1890) 2,127.

Waupun, wâ-pûn', Wis., city in Fond du Lac and Dodge counties; on the Chicago, Milwaukee and Saint Paul Railroad; about 70 miles northwest of Milwaukee and 17 miles southwest of Fond du Lac. It is in an agricultural region. The chief manufacturing establishments are pump and wind-mill factories, cane goods works, umbrella factory, flour and lumber mills, and creameries. In 1900 (government census) there were 42 manufactories, capitalized for \$493,590. The cost of the raw material used annually was \$793,504, and the value of products was \$1,200,844. The principal buildings are the State prison, the city-hall, the churches and schools. The national bank has a capital of \$50,000 and deposits of \$305,300 (Jan. 1903). There are nine churches, a high school, graded schools, and a school library. Pop. (1890) 2,757; (1900) 3,185.

Wausau, wâ'sâ, Wis., city, county-seat of Marathon County; on the Wisconsin River, and on the Chicago, M. & St. P., and the Chicago & N. W. R.R.'s; about 175 miles northwest of Milwaukee and 130 miles north of Madison, the State capital. The city lies on both sides of the river, and the slope is gradual, but sufficient to give good surface drainage. There are parks, broad paved streets, well shaded, and an excellent water system. The reservoir has a capacity of 3,000,000 gallons per day, and the water is obtained from Big Bull Falls. Wausau is in a region of extensive lumbering interests. The chief manufacturing establishments are saw mills, which employ about 1,000 men; sash and door factory, about 400; box factories, granite works, sand-paper factory, machine shops, excelsior factories, novelty works, veneering factories, canneries, paper mills, and flour mills. In 1900 (government census) Wausau had 137 manufacturing establishments, capitalized for \$3,094,178, and employing 1,643 persons, to whom were paid annually \$594,626. The raw material used each year in the manufactories

cost \$2,238,730, and the value of the finished products was \$3,658,439.

The county court-house (cost \$60,000), the government building, the municipal buildings, the County Asylum for the Insane, the churches and schools, the library, and several fine business blocks are among the principal public buildings of the city. There are 20 churches, representing 15 different denominations. The educational institutions are a fine public high school, graded elementary public schools, 10; Roman Catholic and Lutheran parish schools, 5; and a public library. It has also the County Training School for Teachers and a County Agricultural College. There are two national banks and one state bank, having a combined capital of \$410,000, and (1903) deposits amounting to \$2,784,180. The government is administered under a revised charter of 1892, which provides for a mayor and a council of 18 members, who are elected biennially.

Wausau was settled in 1845 by lumbermen. It was platted in 1852 and existed under a town organization until 1861, when it was incorporated as a village. On 18 March 1872 it was chartered as a city. Pop. (1890) 9,253; (1900) 12,354; (1903 est. Gov. Report) 13,284.

E. B. THAYER,
Editor 'Wausau Pilot.'

Wauseon, wâ'se-ûn, Ohio, village, county-seat of. Fulton County; on the Lake Shore & Michigan Southern Railroad; about 31 miles west by south of Toledo. It is in an agricultural region, in which are cultivated grain and vegetables. It has flour mills, creamery, machine shop, and wagon works. It has two private banks. The educational institutions are a public high school, graded school, and a public library. Pop. (1890) 2,060; (1900) 2,148.

Wauters, vō-tār, Emile, Belgian painter: b. Brussels 29 Nov. 1846. He was for four years the pupil of Portaels and of Gerome at Paris. His picture, 'Fair Edith finding the Body of Harold on the Field of Hastings,' attracted wide attention and he was sent by his government to attend in a professional capacity the opening of the Suez Canal. He returned from the East with many sketches and genre pictures and materials, out of which he afterward painted his panorama, 'Cairo and the Banks of the Nile.' His historical pictures are characterized by strong drawing and beauty of coloring; the most famous of these is 'Mary of Burgundy before the Magistrates at Ghent.'

Wave, a form of energy propagated from one part of a medium to another by the disturbance in equilibrium, or stress. Examples, water waves, such tides, rollers, ripples; sound waves; heat and light waves; electrical waves; earthquake waves; temperature waves, etc.

Waves in Liquids.—Waves of translation in liquids are formed where the particles of the liquid are moved slightly in advance of their position by the passage of the wave impulse. This wave was thoroughly investigated by Scott Russell, and is known as the Scott Russell wave. "Its velocity is equal to $\sqrt{g(h+k)}$ where (g) is the force of gravity, (h) the depth of the liquid, at rest, and (k) the height of the crest above the plane of rest." This is the speed at which a canal boat is most economically propelled; for the reason that the boat rides on the

wave, is carried forward by it, and its speed maintained with the least additional expenditure of power. Oscillatory waves, such as the deep "swell" of the ocean, are formed when the particles of the liquid are forced into circular, or elliptical paths, whose plane is vertical to the line of propagation. When the line of propagation of the disturbance is opposite, and equal to the flow of the liquid, "Standing Waves" are the result, as is often seen in rivers. The velocity of oscillatory waves has been estimated as "40 feet per second for waves of 300 feet in length; and the disturbance of the water particle at a depth of 300 feet to be not over half an inch from its mean position." Ripples in liquids are surface waves which move more rapidly as they diminish in length. "A ripple a quarter of an inch long will move one foot in a second. A ripple an eighth of an inch long will move one and a half feet in a second." This is due to the surface tension of the liquid.

Waves in Aeriform Bodies.—Waves are propagated in air by alternate condensations and rarefactions of the medium. The motion of the air particle is very small, but the wave-length is comparatively long. This length may be found by dividing the velocity by the number of vibrations in a given time. In the propagation of the wave, the layers of air are crowded together and a condensation is thus produced at first, after which a corresponding rarefaction takes place. A wave therefore consists of two parts. The motion of the air particle is backward and forward, and not vertical to the line of propagation, as in the case of water waves. A series of waves in air will show alternate condensations and rarefactions in the form of ever increasing spherical shells (Fig. 1).

FIG. 1.

The velocity of sound waves in aeriform gases varies directly as the square root of the elasticity of the gas, and inversely as the square root of its density. It is usually expressed by the formula

$$\sqrt{\frac{E}{D}}$$

There is an added velocity of 2 feet for every Centigrade degree of temperature. So long as aeriform waves are not obstructed in their motion they are propagated in the form of concentric spheres; but when they meet with an obstacle they return upon themselves, forming new concentric waves according to the laws of reflection, see Fig. 2.

Waves in aeriform bodies are also refracted, or bent out of their course, in passing from one medium to another. Two sets of waves which interfere will produce a wave which is equal to their algebraic sum. If the waves are equal and in opposite phases, the sum of their component forces will be zero, and the air particle will come

WAVE

to rest. When a wave of water meets an obstacle, such as a rock, it bends around it, meeting on the other side. This is also the case with waves in air and gases, but the wave so diffuses itself at the back of the obstacle that it is enfeebled in power, and the obstacle casts what is known as a shadow. Sound shadows and light shadows are due to this property of wave motion.

Waves in Solid Bodies.—The vibration of wood and metals in the form of rods and plates may be taken as examples of wave motion in solids. (See **VIBRATION**.) When the vibrating particles of the solid yield up their motion to other particles which in turn perform like excursions in the same period of time, we have a wave propagated through the solid. Such waves in all mediums capable of resistance to distortion, are both transverse and longitudinal. This is the case when an iron bar is struck a blow by a hammer upon one end, two waves are sent through the bar, but the longitudinal has much greater velocity in this case.

FIG. 2.

Earthquake waves are propagated in like manner through the solid earth. The waves which pass through the elastic materials of the earth's crust consist of both longitudinal and transverse vibrations, but the transverse vibrations soon die out, and produce but little effect. In an earthquake disturbance the particles nearest the disturbance are first compressed by the concussion, and then released by the elasticity of the solid earth. This vibratory motion is taken up by the next contiguous particles, and in this manner the pulse or wave is carried to enormous distances. The vibrations of the particles themselves are very small, probably not over one or two inches in length in most cases. If the earth were a homogeneous solid the wave would take the form of concentric spherical shells, similar to air waves, but owing to the different materials composing its crust, and the fractured nature of the crust, its symmetry is destroyed. It should be remarked that the wave here under discussion is the vibratory movement of the crust, and not the violent upheaval, or disruption of the earth itself. When the centre of disturbance is beneath the sea a water wave is generated which travels much slower than the wave through the solid part of the earth. Air waves are also generated by earthquakes which follow the laws of sound waves.

Luminous and Electrical Waves.—The Undulatory Theory of Light presupposes the existence of an invisible medium, filling all space, both molecular and stellar, called the ether,

through which waves of light are propagated, according to the laws of vibration in an elastic solid; and with a velocity equal to the square root of its elasticity divided by the square root

of its density; or $\sqrt{\frac{E}{D}}$.

"In such a medium where the density (D) is small, in comparison with the rigidity that it opposes to any rapid movement, waves will be set up in all directions at right angles to the line of displacement. Let (M) represent a molecule of ether displaced in the direction of the arrow, from A to B; then (a) will represent one of the waves thus generated at right angles to A, B."

FIG. 3.

There are innumerable such waves in every ray of light, which are said to be transverse to the line of propagation. Their velocity is 186,000 miles per second, and their wave-lengths vary from 32 millionths, to 15 millionths of an inch. (See **LIGHT**; **SPECTRUM**; **RADIATION**.) This elastic, solid theory of light has been mathematically treated by Green, Fresnel, MacCullagh, Neuman, Cauchy, and others; and has been generally accepted, up to the last few years, as explaining the various phenomena of light. In recent years, especially since 1887, the Electro Magnetic Theory has largely taken its place.

Recent discoveries have shown that electric waves are identical with light waves in the following respects: they can be reflected, refracted, absorbed, polarized, and diffracted. They differ from light waves in their lengths, which are many feet, instead of a few millionths of an inch. In 1864, before these discoveries were made, Professor Clerk Maxwell predicted that light would be found to be due to electrical vibrations in space. This prediction has been abundantly verified by the investigations of Hertz, and others. The investigations of Hertz are illustrated by the following diagram:

FIG. 4.

The electrical discharges of an induction coil (C) are sent through two square sheets of metal (A and B) attached to two metal rods, with a gap between them. These discharges produce electrical oscillations, backward and forward, through the plates and rods, and when the electrical state is sufficiently high, they become visible as a spark, or are luminous. From the discharge, or electrical oscillations in the plates and rods, electric waves (a, a, a) were set up

WAVE OFFERING—WAVERLY

at right angles to the plane of the plates, which traveled with the same velocity as light waves, and became visible to the eye by means of a spark passing across the gap (G) in a metal ring which was placed in the plane of their vibration. Hertz and others reflected these waves by parabolic mirrors, and refracted them with prisms of pitch, also polarized and diffracted them. Professor Righi verified these results, and demonstrated their interference fringes by Fresnel's mirrors. He also investigated the transparency of different media to these waves, and found that certain kinds of wood polarizes them, as tourmaline polarizes light. "Proofs are now complete that these waves possess all the known properties of ordinary light." The most recent application of these waves is to be found in wireless telegraphy.

JOHN R. PADDOCK,
Member of the Association for the Advancement of Science.

Wave Offering, in Hebrew, *tenuphah*, from *nuph*, to wave, a sacrificial ceremony mentioned in the Old Testament, in Leviticus xiv. 24, in the rites to be followed in cleansing a leper, and in Numbers vi. 20, in the description of ceremonies attending the separation of a Nazarite, and in other places. The offering is believed by the rabbis to have been waved to the four points of the compass, as an acknowledgment of God's sovereignty over the earth, while the heave offering, mentioned in connection with the wave offering, is supposed to have been lifted upward as a tribute to God's rule in heaven.

Wave Motor, a mechanism for obtaining power from the force of ocean waves. The method as adopted in various experiments is as follows: At a point unprotected by outlying rocks or shoals, two wells eight and five feet in diameter, respectively, are sunk in the cliff, one behind the other, the foremost but five feet from the brink. These wells extend from 30 feet above high tide to below the ebb and open at bottom in the ocean. A counterbalanced float rises and falls between vertical guides in the foremost well as the swells outside raise or lower the water level. The plunger of a common force pump working in any part of a long pump barrel occupies the second well, forcing on the down stroke the salt water vertically 125 feet to a 5,000-gallon tank raised on a 60-foot derrick on the bank above. A 35-foot, four-post derrick carries the vertical guides for pump and float, which are fastened at and near the outer end of a 12-inch round timber 60 feet in length, the butt counterbalanced on the bank over two small iron car-wheels rolling on a short track, and thus allowing the timber to recede and advance as well as to oscillate as its outer end follows the vertical guides. The stopping and starting contrivance is the climax of simplicity. A strong chain leads from the outer end of the beam above the float over two shelves at the top of the derrick, and suspends a large barrel in vertical guides at the side. To stop the motor the barrel is filled with water from a short garden hose attached to a convenient connection from the tank. The weight of the filling barrel gradually overbalances the float, raising it above the waves. When the motor is to start, a plug is pulled from the bottom of the barrel and the float gradually goes into action.

Wavellite, an attractive, radiated mineral, essentially a hydrous basic phosphate of aluminum, $4\text{AlPO}_4 \cdot 2\text{Al}(\text{OH})_3 + 9\text{H}_2\text{O}$. It rarely occurs in distinct orthorhombic crystals; usually it is in more or less complete spherical aggregates, externally showing crystal terminations and with radiated structure. Its hardness is 3.25 to 4, and its specific gravity about 2.32. In the many European localities its color is usually white or pale green; at its most important American locality in Arkansas it is light to dark green, while the curious stalactitic wavellite of White Horse, Pennsylvania, is white.

Waverley, wā'vēr-lī, or 'Tis Sixty Years Since, a novel by Sir Walter Scott. It was the earliest of the world-famous series of romances to which it gives its title, and was published in 1814. The author withheld his name at first, from doubt as to the success of the venture. The continuance of the concealment with subsequent issues followed perhaps naturally; Scott himself could give no better reason afterward than that "such was his humor." Although the authorship of the series was generally credited to him, it was never formally acknowledged until the avowal was made in 1827 at a dinner for the benefit of the Edinburgh theatrical fund. 'Waverley' is a tale of the rebellion of the Chevalier Prince Charles Edward, in Scotland in 1745.

Waverly, Ill., village in Morgan County; on the Jacksonville & St. L., and the Saint Louis, C. & St. P. R.R.'s; about 26 miles southwest of Springfield and 20 miles southeast of Jacksonville. It is in an agricultural and stock-raising region, and has flour mills, grain elevators, tile works, creamery, and stock-yards. There are eight churches, graded schools, and two banks. Pop. (1890) 1,337; (1900) 1,573.

Waverly, Iowa, city, county-seat of Bremer County; on the Cedar River, and on the Chicago, R. I. & P., the Illinois C., and the Chicago G. W. R.R.'s; about 27 miles southeast of Charles City and 12 miles north of Cedar Falls. It is in an agricultural and stock-raising region. It has a large number of butter and cheese factories, condensed milk factories, canneries, a furniture factory, a creamery-supply factory, a flour mill, and agricultural implement works. The four banks have a combined capital of \$100,000 and deposits amounting to \$528,470. It has six churches. The educational institutions are Wartburg Teachers' Seminary and Academy, graded public schools, and a public library. The city owns and operates the waterworks. Pop. (1890) 1,337; (1900) 1,573.

Waverly, N. Y., village Tioga County; on the Chemung River, and on the Erie and the Lackawanna R.R.'s; about 17 miles southeast of Elmira and 20 miles southwest of Owego. It is in a region largely devoted to farming and stock-raising. It is a shipping point for large quantities of butter, cheese, milk, eggs, poultry, and farm products. Waverly is near the coal and oil fields of Pennsylvania, and has connection by electric cars with Athens and Sayre, Pa. The two banks have a combined capital of \$100,000. It has six churches, a high school established in 1871, grammar and primary schools, an opera house, and a town hall. Pop. (1890) 4,123; (1900) 4,465.

WAVERLY — WAX

Waverly, Ohio, village, county-seat of Pike County; on the Scioto River, and on the Norfolk & W., and Ohio S. R.R.'s; 57 miles south of Columbus. It is in an agricultural and stock-raising region; and contains flour and saw-mills, tanneries, distilleries, and furniture factories. There is a high school with a school library of over 1,000 volumes. Pop. (1890) 1,567; (1900) 1,854.

Wavey, the common name in the Hudson Bay region for the smaller wild geese, especially the snow-goose. See GEESE.

Wax, a concrete, unctuous-feeling substance, which partakes of the nature of fixed oil. It is secreted by bees in constructing their hives, and is also a most abundant vegetable production, entering into the composition of the pollen of flowers, covering the envelope of the plum and of other fruits, especially of the berry of the *Myrica cerifera*, and, in many instances, forming a kind of varnish to the surface of leaves. It is distinguished from fat and resinous bodies by its not readily forming soaps when treated with alkaline solutions. Common wax is always more or less colored, and has a distinct, peculiar odor, of both of which it may be deprived by exposure in thin slices to air, light, and moisture, or more speedily by the action of chlorine. At ordinary temperatures wax is solid and somewhat brittle; but it may be easily cut with a knife, and the fresh surface presents a characteristic appearance, to which the name of waxy lustre is applied. Its specific gravity is 0.96. At 155° F. it enters into fusion, and boils at a high temperature. Heated to redness in a closed vessel it suffers decomposition, yielding products very similar to those which are procured under the same circumstances from oil. It is insoluble in water, and is only dissolved in small quantities by alcohol or ether. Wax appears to be a mixture of myricin, cerotic acid, and cerolein. The name wax is now applied to substances other than, but resembling bees'-wax; these substances are partly of animal, partly of vegetable origin. In bleaching wax the wax must be melted, with a degree of heat not sufficient to alter its quality, in a caldron so disposed that the melted wax may flow gradually through a pipe at the bottom of the caldron into a large wooden cylinder that turns continually round its axis, and upon which the melted wax falls. As the surface of this cylinder is always moistened with water, the wax falling upon it does not adhere to it, but quickly becomes solid and flat, and acquires the form of ribands. The continual rotation of the cylinder carries off these ribands as fast as they are formed, and distributes them through the tub. When all the wax now to be whitened is thus formed, it is to be put upon large frames covered with linen cloth, which are supported about a foot and a half above the ground in a situation exposed to the air, the dew and the sun. If the weather be favorable, the color will be nearly discharged in a few days. It is then to be re-melted and formed into ribands, and exposed to the action of the air as before. These operations are to be repeated till the wax is rendered perfectly white, when it is cast into cakes or molded into candles.

The principal applications of wax are to make candles and medicinal cerates; to give a

polish to furniture or floors, for which purpose it is largely used in the United States; to form a lute or cement, for which it is used by chemists; and to serve as a vehicle for colors. By modern painters colors previously prepared in oil are sometimes diluted just before being laid on in a mixture of wax and oil of turpentine. This practice is much resorted to by French artists, especially in mural paintings. The object of it is to keep the painting free from that lustrous appearance which often renders it difficult to be seen properly in consequence of reflection. Wax also forms a principal ingredient in modelers' wax and gilders' wax. In the former the other ingredients are druggists' lead-plaster, olive oil, yellow resin, and whitening; and in the latter verdigris and sulphate of copper. Sealing-wax is not properly a wax at all, but is composed of resin lac and some less brittle resin. The largest consumption of wax takes place in Roman Catholic countries, where large quantities are required for the candles used in religious ceremonies.

Wax Figures.—The employment of wax in imitative art dates from a period anterior to historical times, although, according to Pliny, the art of casting it in molds was not practised previous to the time of Lysistratus, its reputed inventor, who flourished about 300 B.C., and whose productions were chiefly portraits cast in plaster molds taken from the face. Wax portraits eventually became common, and among the Romans, who placed them in the vestibules of their houses, were regarded as an evidence of ancient nobility, as none were allowed to possess such images whose families had not borne some curule magistracy. In the Middle Ages, wax was employed in the construction of images of saints and of votive images, and those who practised sorcery melted before a slow fire wax figures of the persons against whom their incantations were directed. In the latter half of the 15th century Andrea del Verrocchio and Orsino gained considerable reputation by some figures of Lorenzo de' Medici, their joint production, which consisted of frameworks of wood or skeletons for the bodies and limbs, while the heads, hands, and feet were cast in wax, painted in oil colors to counterfeit life. They were furnished with glass eyes and natural hair, and were habited in the costume usually worn by Lorenzo. The manufacture of wax figures of the size of life is still carried on to a considerable extent, but has long ceased to be considered a branch of the fine arts, no imitative skill or taste on the part of the artist being sufficient to overcome the ghastly fixedness which such images must always present, and which is the more disagreeable as the resemblance to life is closer. In the preparation of anatomical models and pathological examples, however, wax has been very advantageously employed, the invention being due to Gaetano Giulio Zumbo, a famous modeler in colored wax, who flourished in the latter half of the 17th century. In the succeeding century the celebrated collection of anatomical models in the Institute of Bologna was commenced under the direction of Ercole Lelli, the finest specimens being by Giovanni Manzoli and his wife, Anna Morandi Manzoli. In the Museum of Natural History at Florence are 15 chambers devoted to preparations by Fontana, Susini, and other celebrated modelers; the Musée Dupuy-

WAX-FLOWER — WAY

tren at Paris is famous for its morbid specimens; and almost every considerable city of Europe now has its collection.

Wax-flower, or Madagascar Jasmine. See STEPHANOTIS.

Wax Insect. See SCALE INSECTS.

Wax, Mineral. See MINERAL WAX.

Wax, Vegetable, a solid, fatty substance, that may be regarded as a concrete oil, and which is secreted by many plants, sometimes in large enough quantities to be of commercial importance. It forms, on foliage, a varnish or coating, which prevents excessive transpiration or wetting of the cells; and, on twigs and flower-pedicles, by its slippery surface, keeps unwelcome insects from reaching the flowers and robbing them of their honey. The whitened under surfaces of some willow leaves and the bloom of fruit are composed of wax either in granules or rods or spread over the cuticle. The most familiar example in America of the hard fat or wax in quantity is on the bony nutlets of the wax-myrtles or bay-berries (*Myrica*). The gray-coated drupes of *M. carolinensis* clustering on the bare twigs are conspicuous in seashore regions, after the leaves are fallen; the wax clinging to their rough, granular surfaces when melted is a greenish, hard substance, sharing the balsamic odor of the plant. It was used in colonial times as a basis for candles and for a kind of soap. Other species, of other countries, furnish a similar wax, and are known as candle-berries or tallow-trees. Carnauba wax is exported from Brazil for candles and as a substitute for bees'-wax. It is the coating on the young leaves of *Corypha cerifera*, indigenous to tropical South America. The young leaves are removed and dried. The wax-granules may then be shaken off, in the form of a fine dust, melted and caked. A varnish-like exudation of wax, on the stems of two other South American palms, *Klopstockia cerifera* and *Ceroxylon andicola*, the wax-palm, the latter being a tall tree, slightly thickened at the centre of the trunk and crowned by a tuft of pinnate leaves. This wax is scraped off and melted. A mixture of resin and wax results, from which the latter is extracted by boiling spirits, and is then utilizable for candles. It is, however, seldom seen in commerce. Japan wax is a wax-like, hard fat, which is largely exported from Japan to Europe, in yellowish hard cakes, with a resinous, rancid odor, and often covered with a powdery efflorescence. It is mixed with or substituted for bees'-wax, where its rancid odor is not preventive, and is extracted by several methods, such as heating under pressure or boiling from the crushed drupes of oriental species of sumac (q.v.).

Waxahachie, wäks-ä-häch'ë, Texas, town, county-seat of Ellis County; on the Missouri, Kansas & Texas and the Houston & Texas Central R.R.'s; about 178 miles northeast of Austin, the State capital, and 31 miles north of Dallas. It was founded in 1847. It is in an agricultural and stock-raising region, in which are produced large crops of wheat and a good quality of cotton. The manufactories are cotton-seed-oil mills, cotton compresses, and flour mills. It is a cotton centre for an extensive region; its annual cotton receipts are about 65,000 bales. The principal public buildings are the county

court-house (original cost \$150,000), the banks, churches, and schools. There are six churches, Park High School (white), a high school for colored pupils, established 1893, public elementary and private schools, and a library. There are three national banks and one trust company. Pop. (1890) 3,076; (1900) 4,215.

Wax-bill, or Senegal Finch, an African weaver-bird (*Estrilda astrilda*), one of the section of the family called blood-finches on account of the prevalence of red in the plumage. This has long been a favorite among cage-birds, and is sold by dealers all over the world. It is nearly 5 inches long. The beak is bright red and somewhat swollen. A bright red stripe passes between the eyes, and the middle of the breast and belly is a beautiful reddish-brown. The upper surface of the body is brownish-gray, the lower surfaces lighter, everywhere traversed by very fine blackish wavy lines; wings and tail brown. They are varied much in color by breeders, bright blue tints, even, having been developed in some. Their song is not very interesting, but they are pretty and affectionate in a high degree. Their food and care should be similar to those given to a canary.

Wax-wing, a woodland bird of the family *Ampelida*, a small isolated group of birds of the northern hemisphere, characterized by their shrike-like beaks, silky brown plumage, tall erectile crests, and especially by the tips of the wing and tail-quills terminating in flattened scales closely resembling red sealing-wax. There are but three species, the northern or Bohemian wax-wing (*A. garrulus*); the Siberian wax-wing (*A. phanicoptera*), and the common North American cedar-bird (q.v.). The northern wax-wings make their home near the Arctic coasts of both continents, and breed there, in trees, long before the snow has disappeared in spring. Sometimes it is not seen in the United States or Central Europe for years together, then will appear in vast numbers, but very locally. These erratic movements are doubtless due to presence or absence of food, which consists of both insects and berries (the latter mainly, of course, in winter), but were regarded by the superstitious peasantry of Europe as signs of some visitation of war or pestilence to follow. All the wax-wings are cinnamon-brown, relieved by handsome markings of black, gray and yellow.

Waxy or Amyloid Degeneration. See DEGENERATION (IN PATHOLOGY).

Way, Arthur S., English classical scholar: b. Dorking 13 Feb. 1847. He was fellow of Queen's College, Melbourne, Australia; was classical lecturer in Queen's College, Taunton, in 1870-6, and was the head of the Wesley College of Melbourne in 1882-92. In 1897 he became examiner in Latin to the Central Welsh board of secondary education. His publications include English verse-renderings of the 'Odyssey' (1880) and 'Iliad' (i.-xii. 1886; xiii.-xxiv. 1889); of the tragedies of Euripides (1894-8); of Horace's 'Epodes' (1898); and of Apollonius Rhodius' 'Tale of the Argonauts'; and 'Letters of Saint Paul to Seven Churches and Three Friends' (1901).

Way, in fortification, a space left for the passage round between a rampart and the wall of a fortified place.

Way, Right of. See REALTY.

WAYCROSS — WAYNE

Waycross, wā'krōs, Ga., city, county-seat of Ware County; on the Savannah, F. & W. and the Brunswick & W. (Plant System) and Waycross A. L. R.R.'s; about 95 miles southwest of Savannah. It has manufactories of naval stores, lumber, flour, and agricultural and lumbering tools. The two banks have a combined capital of \$100,000 and deposits (1903) \$367,000. The educational institutions are a high school (white), established in 1890, a high school (colored), and public and private schools. Pop. (1890) 3,364; (1900) 5,919.

Wayland, wā'land, Francis, American college president: b. New York 11 March 1796; d. Providence, R. I., 30 Sept. 1865. He was graduated from Union College in 1813, studied in the Andover Theological Seminary, was a tutor at Union College 1817-21; in 1821 became pastor of the First Baptist Church of Boston, and took a leading place in the ranks of American preachers, his sermon on 'The Moral Dignity of the Missionary Enterprise' (1823) being particularly well known. After holding a professorship at Union (1826-7), he became president of Brown University. During the 28 years of his administration he greatly developed the institution, and was one of the pioneers of the elective system in American universities. Subsequent to his resignation (1855) he was for a year and a half pastor of the First Baptist Church of Providence, after which he devoted himself to various kinds of religious and humanitarian effort. He was the author of many valuable works, including 'Elements of Moral Science' (1835); 'Elements of Political Economy' (1837); 'Limitations of Human Responsibility' (1838); 'Domestic Slavery Considered as a Scriptural Institution' (1845); 'Elements of Intellectual Philosophy' (1854); and 'Sermons to the Churches' (1858).

Wayland, Francis, American legal scholar, son of the preceding: b. Boston 23 Aug. 1826; d. New Haven, Conn., 9 Jan. 1904. He was graduated from Brown University in 1846, took his M. A. degree from Yale in 1872, and began law practice in Worcester, Mass., in 1850, removing in 1858 to New Haven. He was judge of probate in 1864-5, and lieutenant-governor of Connecticut in 1869. In 1872 he became professor in the law school of Yale, and in 1873 dean of the school. In 1903 he resigned the deanship. The development of the school from a minor local institution to its present condition, with adequate financial basis and wide curriculum, is due chiefly to him. He was president of several organizations, including the American Social Science Association, the board of directors of the Connecticut State Prison, the Prison Aid Association from 1872, and the Organized Charities Association of New Haven from 1878. He was prominent as a writer and speaker on sociological and charitable topics and criminology, and was joint author, with his brother, H. L. Wayland, of the 'Memoir' of President Wayland (1867).

Wayland the Smith (Ger. Wicland, vē'lānt; Norse, Völundr; A. S. Weland), a hero of old Teutonic saga. His myth assumes numerous forms. It appears in Scandinavian, Anglo-Saxon, and German poems. The name probably signifies the 'skilful' or 'artful' one. Wayland seems to be a deification of the smith, whose calling was considered among the highest. Epi-

sodes in the story narrate that Wayland was, like Vulcan, lame, and, like Dædalus, manufactured wings and could fly. These are thought, however, to have been late introductions from the classic mythology. In France, too, Galans the Smith was known. Simrock employed the various legends in his epic 'Wieland der Schmied' (1835). The megalithic monument in Berkshire called 'Wayland Smith's cave,' with the character Wayland, empiric, farrier, and pedlar, is familiar through Scott's 'Kenilworth.' Consult Maurus, 'Die Wielandsage in der Literatur' (1902).

Wayne, wān, Anthony, American soldier: b. East Town, Pa., 1 Jan. 1745; d. Presque Isle (Erie), Pa., 15 Dec. 1809. At 18 he became a land-surveyor. He was an intimate friend of Franklin, and early took an active interest in public affairs. Having married and settled to farming (1767), he was elected to the Pennsylvania convention and legislature in 1774, served on the committee of safety, and in 1775 raised a regiment, with which he took part in the campaign against Canada. He fought with distinction, and was wounded at the battle of Three Rivers 3 Jan. 1776; held Ticonderoga till May 1777, and after receiving the commission of brigadier-general joined Washington in New Jersey; led a division at Brandywine 11 September, and commanded the right wing and led the attack at Germantown 4 October. He made a dashing raid on the British lines in the winter of 1777-8, carrying off a great quantity of supplies, and on the night of 15 July 1779 achieved the most brilliant of the American victories in the storming of Stony Point, for which he received a gold medal and the thanks of Congress. He became a popular hero, and his nickname of "Mad Anthony" was as much a tribute to his energy and valor as it was a denotation of his recklessness in action. By a bayonet charge he rescued Lafayette in Virginia in 1782; made a daring attack on the whole British army at Green Spring (6 July), and defeated the British and Indians in Georgia. On the surrender of Charleston, S. C., by the British it was occupied by Wayne, 14 Dec. 1782. He was made brevet major-general 10 Oct. 1783, retired from the army in 1784, and became a member of the Pennsylvania legislature. He was a member of the convention of that State which ratified the Federal Constitution in 1787. Later he settled on a Georgia plantation presented to him by the State in return for his military services; and from Georgia, in 1791, he was sent to Congress, but in a contest during the next year his seat was declared vacant. In April 1792, he was made commander-in-chief of the American army, with the rank of major-general. In 1793 he took the field against the Indians in Ohio, whom he finally defeated at Maumee Rapids or Fallen Timbers, and he forced them to conclude the treaty of Greenville (1795), which gave a large tract of territory to the United States. His death occurred while he was engaged in completing this service. A monument was erected to him at Waynesboro, Pa., in 1809. Consult the 'Lives' by Armstrong (1834) and Moore (1845); Wayne's 'Regimental Orderly Book' on the northern campaign, edited by J. Munsell (1859); Stillé, 'Wayne and the Pennsylvania Line' (1893); Roosevelt, 'Winning of the West,' Vol. IV. (1889-94); and Spears, 'Anthony Wayne' (1903).

WAYNE — WAYNESBURG COLLEGE

Wayne, Neb., city, county-seat of Wayne County; on the Chicago, Saint Paul, Minneapolis & Omaha Railroad; about 95 miles north by west of Lincoln and 85 miles northwest of Omaha. It is in an agricultural region, in which the principal productions are wheat, corn, sugar-beets, and potatoes. Wayne makes extensive shipments of grain, hogs, cattle, hay, and vegetables. It has Nebraska Normal College (private), a high school, and public graded schools. The four banks have a combined capital of \$230,000 and deposits (1903) amounting to \$648,000. Pop. (1890) 1,178; (1900) 2,119.

Waynesboro, wānz'būr-ō, Ga., city, county-seat of Burke County; on the Central Railroad of Georgia; about 100 miles northwest of Savannah and 30 miles south of Augusta. It was laid out as a town in 1783, and in 1888 was incorporated as a city. The chief manufactures are cottonseed-oil mills, wagon factory, agricultural implement works, and a cotton compress. It has seven churches, one public high school or academy, and Waynesboro Academy (a private high school), and elementary public schools. A battle was fought here during the Revolutionary War, and one during the Civil War. Pop. (1890) 1,711; (1900) 2,030.

Waynesboro, Pa., borough in Franklin County; on the Mont Alto and West Maryland R.R.'s; about 48 miles southwest of Harrisburg. It is the commercial and industrial centre of quite an extent of territory. The chief manufacturing establishments are machine shops, creameries, ice-machine and engine works, plow factory. In 1900 (government census) Waynesboro had 61 manufacturing establishments, capitalized for \$3,984,774. The number of employees was 1,103, and the annual cost of raw material used in the manufactories was \$1,072,213; the value of the products (annually) was \$2,731,059. The borough is near South Mountain and Antietam Creek. The Confederate army passed through Waynesboro on the way to and from Gettysburg. Pop. (1890) 3,811; (1900) 5,396.

Waynesboro (Va.), Battle of. On 27 Feb. 1865 Gen. Sheridan started from Winchester, Va., on his final campaign up the Shenandoah Valley, under instructions from Gen. Grant to destroy the Virginia Central Railroad, the James River canal, capture Lynchburg, if practicable, and join Gen. Sherman, wherever he might be found in North Carolina, or return to Winchester. He had Custer's and Devin's divisions of cavalry and two sections of artillery, about 10,000 officers and men, the whole commanded by Gen. Merritt, his chief of cavalry. At Mount Crawford, 1 March, he was met by Rosser's cavalry which was promptly dispersed, and 2 March he reached Staunton, which had been abandoned by Gen. Early, who had fallen back eastward to a ridge west of and near Waynesboro, where he could muster only Wharton's two small brigades of infantry, Nelson's battery of six guns, and Rosser's cavalry, in all not over 1,800 men. Merritt followed from Staunton, and late in the afternoon, after some artillery-firing, three of Custer's dismounted regiments moved around Early's left flank, between it and South River, while two of his brigades charged his front. Early's men made but a feeble resistance, and broke in a disorderly rout, hotly pursued by the Union cavalry through Waynesboro and as far as the South Fork of the

Shenandoah and to Greenwood Station, where five guns were captured and several loaded cars burned. Merritt took as prisoners 1,450 officers and men, and captured 11 guns, with horses and caissons complete, 200 loaded wagons, and several battle-flags. Gens. Early, Long, Wharton, Lilley, and Rosser, with a few men, escaped. From Waynesboro the prisoners and captured artillery were sent back to Winchester, under guard of 1,600 men. Early's army had disappeared, and Sheridan moved unmolested to the Virginia Central Railroad, which was destroyed for several miles. The swollen condition of the rivers made it impossible to join Sherman, and Sheridan determined to destroy still more thoroughly the railroad and James River canal and then join Grant in front of Petersburg. He divided his command, sending one part to the James River canal, which it destroyed as effectually as the other part destroyed the railroad. This done, he moved to White House on the Pamunkey River, where he arrived on 19 March 1865, and thence to the army in front of Petersburg. Consult: 'Official Records,' Vol. XLVI.; Pond, 'The Shenandoah Valley in 1864'; Sheridan, 'Personal Memoirs,' Vol. II.; Early, 'Last Year of the War for Independence'; The Century Company's 'Battles and Leaders of the Civil War,' Vol. IV. E. A. CARMAN.

Waynesburg, wānz'běrg, Pa., borough, county-seat of Greene County; on Ten Mile Creek and on the Waynesburg & Washington Railroad; about 44 miles south of Pittsburg. It is in an agricultural and stock-raising region, and in the natural-gas and oil belt. It has flour mills, a foundry, a planing mill, carriage factory, machine shop, and creameries. It is the seat of Waynesburg College (Cumberland Presbyterian). The five banks have a combined capital of \$675,000 and deposits (1903) amounting to \$2,332,190. Pop. (1900) 2,544.

Waynesburg College, located at Waynesburg, Pa. It was chartered in 1850 and first opened to students in 1851. It was established by and is under the control of the Pennsylvania Synod of the Cumberland Presbyterian Church, and the trustees are elected by this synod. In 1902 the board of trustees was increased from 11 to 21 members, and the Alumni Association empowered to submit 12 nominations, from which 6 trustees shall be elected. The college for many years labored under serious financial difficulties, and it was not until 1898 that an adequate endowment was obtained, which was increased in 1900. Since that time the curriculum has been extended, especially in the study of the sciences, and the equipment greatly improved. The college offers three regular courses, classical, literary, and scientific, which lead to the degrees of A.B., B.L., and B.S. Greek is required for the A.B. degree. These courses all include some electives in the work of the last two years, the list of electives from which the student may choose differing in each course. The degree of A.M. is conferred for graduate work; courses leading to the Ph.D. degree have been discontinued. In addition, the college maintains a preparatory department, a normal department, a conservatory of music, and a school of oratory. The college adopted the system of co-education at the first, and has found it most successful. The students maintain two literary societies and a Young Men's and a Young Women's Christian

WAYS AND MEANS COMMITTEE — WEALDEN

Association. The buildings include the main building and Hanna hall, a dormitory. There are well-equipped chemical and biological and physical laboratories, recently established. The library in 1904 contained 6,535 volumes, and the productive funds amounted to \$75,000. The students numbered 384, and the faculty 14.

Ways and Means Committee. See FINANCE; SENATE, U. S.

Wazan, wā-zān', Morocco, an inland town, picturesquely situated on the steep northern slope of a two-peaked mountain, in the hill country 90 miles southeast of Tangier. It is a sacred city of refuge, and a place of pilgrimage, the headquarters of the grand sherif, the spiritual ruler of Morocco. The principal buildings are the great mosque and the tombs of a long line of sherifs. The trade is, as elsewhere in Morocco, mainly in the hands of the Jews. Pop. 20,000. Consult Watson, 'A Visit to Wazan' (1880).

Waziristan, wā-zē-rī-stān', the country of the Waziris, Northwestern India, a mountainous region situated west of the Suliman range, north of British Baluchistan, and east of Afghanistan. It is now partly included in British India, and has at various times been the scene of military operations owing to the depredations and raids of the Waziris on the caravans traversing the Gomul Pass. It is a mountainous country, with much fine scenery, and a delightful climate except in some of the valleys. The Waziris, a portion of whom are known as Mahsuds, are a hardy race of Afghans. It is estimated that they number about 44,000 fighting men. Some of them have settled peaceably within British territory, where they cultivate 27,000 acres and pay a revenue of \$4,500. Their crops are wheat, maize, and barley; they raise horses and sheep, and iron and wood are exported.

Wea (contraction of *Wayatonuki*, "Eddy people"), a tribe of the Algonquin stock of North American Indians, belonging to the Miami confederacy. When first known to the whites, in 1672-1703, they were in Wisconsin, but they seem to have gradually drifted southward, and in 1701 one of their villages was on the site of the present Chicago, Ill., and in 1719 their chief village was on the Wabash below the mouth of Wea Creek, in Indiana. They were hostile against the whites in western Virginia, in which their country was situated, but they finally signed the celebrated treaty of Greenville in 1795, and in 1820 sold their last lands in Indiana and moved with the Piankashaws to Illinois and Missouri. In 1832 they again sold their lands and the main body moved to Kansas, whither a few of their number had already migrated. In 1854 the rapidly decreasing Weas and Piankashaws united with the Peorias and Kaskaskias of the Illinois confederacy; at this time their population aggregated 259, largely mixed-bloods. In 1868 they moved to the Neosho in Indian Territory, where they have since remained. The Miami number 110 and the Peoria 185, but the population of the Weas is not separately recorded.

Weakfish, or **Squeteague**, a spiny-rayed fish of the genus *Cynoscion* and family *Scianidae*. It has no teeth on the vomer or palate bones, but numerous ones in the jaws, one or two in the front of the upper jaw, having the form of

elongated canines; the head is convex, supported by cavernous bones; the air-bladder has a horn on each side projecting forward. The genus is chiefly American, with about 15 North American species. The common weakfish (*C. regalis*) is 1 to 2½ feet long, brownish blue above, with irregular brownish spots, and tinged with greenish and banded in the young; the sides silvery, abdomen white, and iris yellow; lower fins orange; a single row of very small teeth in the upper jaw, and a double series in the lower; dorsals separated, and the second, with the caudal and anal, mostly covered with scales. This is one of the most abundant fishes along the entire Atlantic coast from Cape Cod to Florida, but there have been times when the invasions of bluefish have driven them from parts of the coast. The name originated from the little resistance it makes when taken, and from the ease with which the delicate structure of the mouth enables it to break away. This is the name most employed on the New Jersey coast, while in New England the Indian name "squeteague" is usual, and in the South sea-trout is applied to this and to the spotted *Cynoscion*. On the New Jersey coast it appears early in the spring, being most abundant toward the end of July, and disappears late in the autumn; it is a greedy biter, and is easily taken by any soft white bait, affording great sport for about an hour on the flood tide; it swims in shoals near the surface, and requires a line slightly if at all leaded. In summer it is abundant about the mouths of rivers, where the water is brackish, and sometimes ascends far up, having been taken in the Hudson above Sing Sing; it is taken by seines and pound-nets in large quantities; when caught it makes a croaking sound, also heard when the fish is at the bottom. The flesh is wholesome and well flavored, but so quickly gets soft that it does not rank high in the market. The air-bladder makes excellent isinglass for culinary purposes. The spotted weakfish (*C. nebulosus*) is conspicuously marked with round black spots above and the soft-dorsal fin is not scaly. It is more southern than the squeteague, and is sometimes called spotted trout. Other related species occur in West Indian waters and on the Pacific coast.

In 1901, 23,496,383 pounds of weakfish, valued at \$558,653, were taken in the fisheries of the Middle States, Maryland, and Virginia, and in 1898 the New England States yielded 4,691,188 pounds, worth \$108,945.

Wealden, wēl'dēn, the name given to certain delta-deposits of the Cretaceous (or Chalk) system, from their great development in the weald of Sussex, England. Weald means in Old English a wood or forest, and the name is applied to a tract of country lying between the north and south downs of Kent and Sussex. The recognized geological name of this subdivision of the Cretaceous system is the Neocomian, from the old Latin name of Neuchâtel in Switzerland. This stage in the south of England, and thence eastward across Hanover, consists of a mass of sand and clay, sometimes 1,800 feet thick, representing the delta of a river. Only a portion of this delta remains, but as it extends in an eastern and western direction for a distance of at least 200, and from north to south less than 100 miles, its total area may have been 20,000 square miles, indicating a very large river. The stream not improbably descended

WEALTH—WEASEL

from the north or northwest. It carried down the drifted vegetation of the land, with occasional carcasses of the iguanodons and other terrestrial or amphibious creatures of the time. Beyond the area overspread by the sand and mud of the delta, the ordinary marine sediments accumulated, with their characteristic organic remains. From Yorkshire, England, they stretch eastward through northwestern Germany, and are found at the base of the Cretaceous system through France into Switzerland. See GEOLOGY.

Wealth, in political economy, a term applied to all objects possessing value. Such objects are defined, in general, as useful, transferable, and limited as to supply. There is some confusion regarding the sense in which the word is employed by various authors, but standard usage limits the term to external objects, excluding all personal attributes. Wealth is frequently confounded with money. See POLITICAL ECONOMY; VALUE.

Wealth of Nations, An Enquiry into the Nature and Causes of the, a famous work by Adam Smith, published in 1776. It is a treatise especially designed to show the wisdom and justice of free trade among nations, and forms the foundation of the modern science of political economy. The style of the work is diffuse, and to a very large extent it drew from the work already done in France by the economists of the "Encyclopédie" school. Five English editions of the work appeared during its author's life, and it was translated into many modern languages.

Wealth of the World. The total wealth of the world, while not exactly known, has been estimated at \$500,000,000,000. This is probably an underestimate of the actual amount of money and property in civilized and semi-civilized lands. Of this total, the greater part is owned by Americans and Europeans. The United States has somewhere near \$100,000,000,000, or about one fifth of the whole. Among foreign nations the total wealth has been estimated as follows:

Great Britain	\$50,000,000,000
France	48,000,000,000
Germany	40,000,000,000
Russia	32,000,000,000
Austria-Hungary	27,000,000,000
Italy	16,000,000,000
Spain	12,000,000,000
Scandinavia	7,000,000,000
Belgium	5,000,000,000

The percentage of public debt per capita of European countries has been estimated as follows:

COUNTRIES	Population	Debt per capita
Austria-Hungary (1901).....	45,242,889	\$ 24
Austria (1901).....	26,150,597	27
Hungary (1900).....	19,092,292	54
Belgium (1901).....	6,693,810	75
Bulgaria (1899).....	3,733,189	13
Denmark (1901).....	2,464,770	24
Greece (1900).....	2,434,000	68
Holland (1901).....	5,179,000	88
Italy (1900).....	32,449,754	83
Norway (1900).....	2,239,880	28
Portugal (1901).....	5,928,659	166
Rumania (1901).....	5,512,520	46
Servia (1900).....	2,493,770	32
Spain (1901).....	18,226,040	100
Sweden (1901).....	5,175,228	17

The total wealth per capita of various countries is as follows:

Great Britain	\$1,442
France	1,257
Germany	709

Russia	\$ 296
Austria-Hungary	499
Italy	485
Spain	548
Belgium	739
Portugal	417
Greece	485
Australia	1,228
United States	1,123
Denmark	1,104
Canada	949

Weaning, the accustoming of an infant to food other than its mother's milk, or the disengaging of a child from the habit of nursing. In normal cases it is now deemed desirable to continue nursing for nine or ten months after birth. With children who are healthy, and cut their teeth early, weaning may begin earlier than with weak, sickly children. It should never be attempted during sickness, nor, unless absolutely necessary, in hot weather. It is best for both mother and child to bring it about gradually. By so doing the secretion of milk in the former is slowly diminished, and those complaints which arise from sudden weaning are prevented; while the child is gradually accustomed to other kinds of sustenance, and the restlessness and want of sleep, which are so troublesome in sudden weaning, are avoided. Both during the weaning and for some time after it no food should be given to the child except what is very easy of digestion, and more fluid than solid, and in particular what has no stimulating qualities, nor any that will tend to create acidity, or produce other marked changes in the organic functions. See INFANCY.

Weare, wär, Meshech, American colonial leader: b. Hampton Falls, N. H., 16 June 1713; d. there 14 Jan. 1786. He was graduated at Harvard in 1735; studied theology and entered the ministry, which he gave up for the practice of law; was repeatedly sent to the legislature, and in 1782 was speaker. His later appointments included that of commissioner to the Albany Congress (q.v.) in 1774, justice and (1777) chief justice of the superior court of judicature. He was also colonel of a militia regiment, and when the Revolution opened was appointed chairman of the Committee of Public Safety. Upon the reorganization of the State judiciary he was placed at its head. He raised troops for defense against Burgoyne, whose invasion he materially aided in repelling. In 1776, under the temporary constitution, he was elected president of the State, and was annually re-elected until 1784. Under the new constitution he was again elected president, but resigned before the expiration of his term.

Weasel (*Putorius noveboracensis*), a fur-bearing mammal (q.v.), typical of the family *Mustelidæ*. The body is elongated and slender, the head long, the legs short, the muzzle rounded and the tail short and slender. The feet have each five toes and are digitigrade and unwebbed. There are 34 teeth and the sectorial or flesh-tooth lacks an internal tubercle. The anal glands are developed and secrete a strong-smelling substance. The weasel attains a length of from 12 to 15 inches, of which the tail makes nearly one third. The male is larger than the female. Above the color is brown, below white or pale yellow, the terminal one third of the tail black. In winter the fur becomes more or less white, but this change is complete only in the north and does not affect the black of the tail; in this white phase the animal is called an

WEATHER BUREAU — WEATHER MAPS

ermine (q.v.). The common weasel, in one or other of its varieties, inhabits the entire eastern United States, westward to Minnesota, south to North Carolina and north to Canada; and is replaced in most other parts of North America by more or less closely related species and in Eurasia by others, of which the Siberian ermine is its nearest ally. Owing to its retiring and nocturnal habits it is often, quite unknown to most people, plentiful even in the vicinity of large cities, where it renders efficient service in the destruction of vermin. The weasel is a highly courageous animal, and makes war on rats, mice, hares and rabbits, birds, and many other small animals. During the summer it devours insects, but appears never to partake of a vegetable diet. Many instances are on record in which these animals have spontaneously attacked horses and cows, and they seem nearly at all times to exhibit an utter indifference to the proximity of man. They are especially fond of eggs, and rob hen-roosts and the nest of every wild bird which they find. Their mode of killing their prey is characteristic—since they usually fasten on to the neck of their victim, and hold firmly on while they suck the blood; next they eat the brains and only then the flesh. Like most of their near relatives they often kill much more than they require for food. They hunt by scent and are tireless in pursuit. Few animals are so active, and the slimness of their bodies enables them to explore every hole and hiding-place of their prey. Weasels live in holes under stone walls, rocks and trees, in burrows captured by force from ground-squirrels and woodchucks, in hollow stumps, etc. A nest of dried leaves and grasses is constructed and about five young are born in a litter. Consult: Coues, 'Fur-bearing Animals' (Washington 1877); Merriam, 'Synopsis of the Weasels of North America' (Washington 1896).

Weather Bureau, United States. See METEOROLOGY.

Weather Maps. Meteorology has, of late years, made rapid progress. In 1870 the United States established its Weather Bureau for gathering the facts that pertain to this branch of science. We were not the first, or the original promulgators of the present system, but we were the first to establish the system upon a grand basis, by which we have accomplished such satisfactory results. Our extended territory is most favorable. The main portion of the United States, covering in round numbers, an area of 3,000 miles from west to east, and some 1,500 miles north and south. The first maps were crude affairs, but gradually the improvement and perfection came. At first, on the map, the two grand centres or factors high and low were not tracked. They were simply indicated. After a while it was seen that there was a movement of these factors of high and low barometer, from the west toward the east, or contrary to the movement of the sun. "Barometer" being a long word, on the map it is not used, but it is the while understood. When the word high is used it stands for high barometer, and when the word low is used low barometer is understood. So the terms high and low have come to stand for high and low barometer. High is a cold, dry factor, and cold in proportion to its intensity, while low is a wet factor, and cold or warm in proportion to its latitude.

The movements of these factors high and low are from the west toward the east—on general lines. At first the term "general lines" may seem like a loose method of referring to these factors, but when we come to understand the subject, we readily see that this term "general lines" is most appropriate and definite; there is nothing loose as to thought in this term. The highs and lows enter somewhere in the west—south or north—and travel toward the east; at times much after the manner of a vessel at sea, against a head wind, tacking, in order to reach a certain point to the windward. These highs and lows do not tack, but they often take similar lines; hence the reference to this detail of navigation in order to illustrate the lines that these factors take in their course over the country and around the world. There are four general points at which the lows enter, and one general point at which they pass off the Atlantic coast toward the east. Which the superior factor? it may be asked. The reply is, neither—one is as much the superior as the other; they are parts of one stupendous system, whereby nature re-animates and invigorates the atmosphere of our earth. We speak of the lows first because they are the storm centres; yet the highs likewise perform their part; they furnish material that is an essential feature of the storm. The two work together and produce all the changes that come under the head of what we so commonly call our "Weather System." The lows enter the territory of the United States at four different points. But it must not be assumed that these points are always the same, and that they are like the great gates of the ancient city. One point of entrance is in the extreme Northwest, in the neighborhood of Puget Sound, and the other, or the one we may call the second, is in the Southwest, at the head of the Gulf of California. The third, we first find on the borders of the Gulf of Mexico, and evidently comes up from some point on the lower Pacific coast of Mexico. When our system is extended so as to cover Mexico, as the United States is now covered with stations, we shall be in position to determine the course of these lows before they enter our territory. From this direction they evidently come. The fourth set are first revealed to us when they make their appearance in the southeast of the lower coast of Florida. These lows, coming from this southeastern quarter, may at first cause some doubt as to the course of the storm, but when we come to study the system, as now revealed to us, there will be seen to be no inconsistency in the statement that the general movement is from the west toward the east. When we come to have our system of stations established through Mexico and the West Indies, what we arbitrarily term the third and fourth, may be one and the same, or this fourth may be an independent centre, coming up from the Spanish Main. As to these two herein designated as the third and fourth, we must at present, in regard to them, remain in darkness. This darkness, though, should at once appeal to the scientific world to plead for the essential stations through Mexico and the West Indies. In time we evidently shall have stations all over the world; then we shall have a weather map that will enlighten us as to the system of the whole. We cannot study the tidal system of the earth in a mill-pond, nor

WEATHER MAPS

even in the greatest of inland seas. We must have access to the oceans of the world. So with meteorology, we cannot study the beautiful system in a small or circumscribed territory. We must have an extended territory, and the more extended the better the results. The lows that enter at the northwest gate sometimes from this point travel due east—toward the Great Lakes and along the St. Lawrence Valley, to the Atlantic Ocean. At other times they will, from this point of entrance, travel toward the southeast, even down to the mouth of the Mississippi, and from there take a course toward the northeast, leaving the Atlantic coast at about the same point as the one that took the direct course toward the east. The low that enters at the southwest, also may go on a line as nearly east, until it reaches the vicinity of the mouth of the Mississippi; then from this point it may travel toward the north and join the low that came from the vicinity of Puget Sound; or it may move along the shores of the Gulf States, even as far as the Atlantic seaboard, then move northward toward the banks of Newfoundland. The third or the low from Mexico often takes a similar course, after it has reached the mouth of the Mississippi. But those from the West Indies are probably the most erratic, and more than any other set of lows they at times, for considerable distances, will travel along a line that is quite contrary to the general direction. The one that in 1902 produced the great and terrible storm at Galveston was of the most erratic character. It came up from the West Indies, and was first revealed to us off the lower coast of Florida, that is, within the lines of the United States. From this point, instead of going toward the northeast, as do the greater number of these storms, for 24 hours it traveled due west, covering the distance of some 1,100 miles in 24 hours—an erratic direction and a phenomenal speed. On an average the lows travel from 300 to 400 miles a day, but here was one that traveled 1,100 miles in one day. Why? it may be asked. If the reader will consult the map of the day on which this storm first appeared off the lower coast of Florida, he will see that an extensive high covered the territory of the southeast section of the United States, which was like the great mountain that at times turns the direction of a stream. Because of the location of that high, the low could not pass toward the north, so it must take the direction of the least resistance, and that was toward the west. It had a clear field; there was nothing in its way. It flew across the Gulf from the east toward the west. Then it turned toward the north, veering more and more toward the northeast and joined the path of the lows that pass off the coast at Newfoundland. So while its direction was for a while toward the west, its general direction was toward the east. One thing that has operated against meteorology is the fact that the courses of the lows and highs are so peculiar, as is also their speed. So by some it is not regarded as an exact science. If the movements of the highs and lows could be worked out by some process of arithmetic, or even the higher mathematics, then a certain class would have more interest in it. But we must take nature as we find it. It is a fact that the highs and lows do travel as they do. We cannot change this; the laws that govern them must stand.

From fall to spring the greater number of the highs that enter the Pacific coast centre on Cape Mendocino, and this accounts for the peculiar climate of the Pacific coast; as there is the while the central high and the low to the north and the low to the south of it. Having knowledge of this, we readily understand the peculiar climatology of the Pacific coast. Then if we will study the map and see the course of the majority of the lows that travel across the country, it will not be difficult to understand the climatology of the eastern section of the United States. Indeed, without the knowledge we obtain from the weather map, it is not possible to understand the climatology of any section. With this knowledge, all that comes under the head of climatology is exceedingly easy to comprehend. Until we had the weather map, the so-called "Texas norther" was a mystery; now the explanation of this phenomenon is as plain to us as why the locomotive moves over the land or the steamship over the seas. When the conditions occur that produce the "Texas norther" the map reveals to us that the high that entered at Cape Mendocino, instead of moving directly east, or toward the northeast, moved toward the southeast and covered the territory of Texas, and later the territory of the Gulf States.

It was one of these highs that a few years ago was so destructive to the orange trees of Florida. Let it be borne in mind that the wind is always from the high toward the low; not in a direct, but in a curved line; for the reason that low is the centre toward which the winds move. The winds from the four points of the compass, north, east, west, and south, must come together at this point, or the centre low, and as they approach the centre these winds necessarily react upon each other and deflect each other toward the right, as we face the centre of low. So the term "general" as to the winds is as pertinent as is the direction of the factors high and low. The highs and lows travel on general lines from the west toward the east; the winds travel on general lines from the high toward the low. Before we had the weather map to throw light on this subject there was much crude thought about the movement of the winds. It was often stated that the winds moved over the surface of the earth in epicycles, and even to this day persons who have not heeded the lessons taught by the weather map claim that the winds during the fierce storm travel in epicycles, and to these storms they have given the name "cyclone." The weather map relegates the term "cyclone" out of the list of words—it is a misnomer. And yet, when the fierce hurricane or the fierce summer local occurs, and evidence is found of objects along the path of the storm being twisted about in a most erratic manner, the supposition of the past was that the winds moving in epicycles produced this effect. But such is not the case. Water rushing down a steep incline does not take such a course. From time to time it may meet with some firm object like a great rock, and thereby an eddy or whirlpool may be caused, but if the obstacle was not in the way the water would flow on its course, and the course would be as straight as the nature of the valley or incline would permit. So with the winds. Winds that are moving at the rate of from 50 to 100 miles an hour do not stop to

WEATHER MAPS

take epicycles. In the summer-local the wind moves along a very narrow path, and after moving a short distance becomes, as it were, a thing of life, and often assumes a huge serpentlike shape—a bolt moving over the surface of the earth. If there is nothing in its way it moves along on a straight line. But if there is some firm object in its course it may be deflected, right, left, or over, as the case may be; it may pass over some objects, while others it will hit and send them rapidly whirling off toward the right or left, depending upon which side the blow from the bolt is given. Then in this connection of late there has been intimated, evidently from European sources, the term "cyclone and anti-cyclone." By the "cyclone" agent or power they mean the low that causes the fierce winds to rush toward it; to the high, which is the magazine of the airs that rush toward this low centre, has been given the name "anti-cyclomatic." Might as well call a hill an anti-valley. At times some persons ask, why should the highs and lows move as they do, and because they cannot understand the why, they take little interest in the subject as a whole. No more than any other medium can the weather map explain the first cause, but it can, if we will properly study it, lead us up as near to the first great cause along its line as can any other medium along any other line of science. In all departments of nature there are facts that we must accept, whether they do or do not make clear to us all the mysteries of cause and effect. There is one thing certain, the more facts with which we are familiar the greater our chances for comprehending the laws that govern all departments of nature. To be indifferent in regard to obtaining facts, and then to be indifferent and even to condemn such labors as lead up to the better interpretation of nature and nature's laws, seems most absurd. And yet this is the position of many. Because we cannot, at present at least, tell what is the cause and why the peculiar action of these two factors high and low, they refuse to take interest in the subject as a whole. In all departments we sooner or later come to the point where we must fall back upon theory. While this is not final it oftentimes serves as a provisional structure that later on leads up to grander results.

Why should high and low have the characteristics peculiar to them? Where facts fail to reveal any further light it is then well to resort to theory, and in plausible theory there is often much satisfaction. There is no better way for a plausible theory as to low than in imagination to put ourselves back at the very beginning, when the sun began to shine upon the earth and to cause it to revolve. It could not turn in but one direction, and it might as well turn or revolve in one direction as the other. The Grand Architect of the Universe evidently saw fit to have it turn on its axis as it does—toward the east. Possibly there would be no difference in the conditions that follow, whether it turned east or west. It must turn toward the sun. When the earth first began to move some one point, or a belt of centres, became the point or points where the heat of the sun was concentrated; much like the action of the double-convex lens that is so commonly called a "sun-glass." The heat of the sun acting upon the waters of the earth produces clouds. At the point of concentration there is, on the part of

nature, an attempt, at least, to produce a vacuum which causes a movement of the surrounding airs toward that point. Soon the direct heat of the sun is shut off from this point. The while the earth is turning and another and another point is exposed to the concentration, and so on until the circle of the earth is complete. Toward these points of concentration, designated by the term low, the surrounding airs are brought. The propelling force, we term the winds, is the result of the concentration at low. After reaching these points, the airs becoming heated, ascend, to a point a number of miles above the earth, where they take the lines of the boiling water in the pot—convection. These heated airs spread outward from the centre in all directions. As the atmosphere at these higher altitudes is cold, the coldness is gradually imparted to these warmer airs that have ascended to this high elevation. Becoming cooled, they lose their buoyancy and therefore descend. By heat they have ascended; by cold they descend, and where they descend they build up heavy banks of pure airs, airs containing a minimum of moisture; and these points become great magazines of pure air, and we designate them as highs. So all over the world are the lows and the highs. On the surface the movement of the airs is from the high toward the low; above this it is reversed, the movement being from the low toward the high, which readily accounts for the direction of the light cirrus clouds, at times seen moving along a line directly opposite from the movement of the winds at the surface of the earth.

So the weather map has even a wider and deeper or higher revelation than at first it appears to have. It becomes a veritable Jacob's ladder that connects that which is below with that which is above. It reveals to us the motion of the atmosphere above the earth, as well as the movement along the surface. Then if we will go a little further in our investigation, it reveals to us how nature makes or produces electricity, and how simple are the elements and the process. First, we start with the heat power of the sun acting upon water. This causes what is called evaporation, which is simply so much water combining with so much heat, whereby miniature globules or balloons are produced. Herein is the heat and water, which in due time reaches the condition or form of force which we designate as electricity, which is a subtle yet powerful product of heat that comes from the relatively north low. The wind being from the high toward the low, when low is to the north, say moving along the line of 50° N. L., all to the south thereof will be warm because of the south winds, which are by this north low being brought toward the north. The clouds cover the point low, but the heat power of the sun shines upon the upper side of these clouds, thereby superheating them. As the heat power at low increases, the clouds are not only brought there in greater masses, but in combination with the heat and friction the explosion of the confined gases takes place; a noise that we term thunder is produced, and the confined heat, now highly intensified, escapes. This we term lightning, and the whole process is termed electricity. So we often hear the term "electric storm." In one sense it may be a storm of this character, but in reality it is only the sub-result of a storm. It does not always accompany the storm, nor

WEATHER MAPS

even all sides of the same storm. To the south of the centre, at times it will be present, while to the north of the centre it will be absent. What is known by the name "thunder storm" is far more frequent in the warmer than in the colder months. In the colder months even the north low will not produce this peculiar storm condition.

There are two classes of storm, the general storm and the local. The general storm is where the precipitation takes place over a wide area, from 500 to even 1,000 miles in diameter. The local is peculiar to the warmer months, and is called local for the reason that it takes place at points here and there, to the south of the main storm centre. These are of a more fierce nature than the general storm. They don't last long, sometimes less than an hour. But there is no need here to say how long they last, for that is something patent to all, and the public as a rule does not care to be told something about which, without effort, they know so much.

The hurricane is a fierce general storm, where the barometer is very low, reaching a point of 28 inches pressure. The tornado is the fierce local storm. In winter there is a much greater difference between the pressure of the high and the low than in summer. In the winter the high will, even in northern sections, reach a pressure of 31 inches. But generally, through the central portions of the United States, say, centering upon the line of 40 N. L., the pressure will be 30.7. This will be a great pressure and will produce intense cold. A winter low will often be 29.4 and at times as low as 28. During the winter months over the area of the United States there is often a difference of three inches, while in the summer the normal difference will not be more than so many tenths; that is, the low will be 29.9 and the high 30.2. At times when a severe storm is raging the low pressure may go down to 29.4. But ordinarily during the summer months there is very little difference between the pressure of these two factors.

It is often asked how far ahead can we prognosticate the weather. There are men claiming their ability to forecast the weather for months ahead. If one will study the weather map and see the variety thereon revealed, the various shapes that the highs and lows take, their peculiar and oftentimes surprising course, he will not be apt to have much confidence in anyone's claim for forecasts, say, beyond four or five days. There are times when it is easier to predict what will be for four or five days in advance than at other times to predict with any certainty beyond 24 hours or for that minor part of time. If the map is regular, that is, well defined and extensive highs and lows, we may safely forecast the weather for a number of days, perhaps a week. But the first thing we know, there is a change in the conditions. Instead of there being a few well-defined lows and highs, the atmosphere is all broken up into a number of small areas, thereby making the problem of prognostication far more difficult.

In order to produce the changes in our meteorological system, heat is required; there is not sufficient heat in the moon to produce the necessary effect—only the heat power of the sun is sufficient for the purpose. In the colder months the gradients or lines of equal barometric pressure are much nearer together than dur-

ing the warmer months, and if one will become familiar with this it is a good and concise way of describing the weather. The gradients are near or far apart, as the case may be. It will be found to be a very expressive term. In the northern States, that is, States, say north of 40 N. L., most all of the passing lows in the cooler months produce snow. At times there may be a succession of north lows, whereby the atmosphere is heated to such an extent as to cause the precipitation to be in the form of rain rather than snow. But during the winter months, the highs being so intense and following the lows, the atmosphere has little opportunity to become heated, so that from the passing low there is snow rather than rain, but in the States midway between the north and the south line, say, below 40, where there is oftentimes much snow, the precipitation in this form in winter is only from a low that is passing along a line from the Gulf States toward the north. In this southern section the north lows cause rain rather than snow. The low in the south causes the north wind in that quarter, and the north winds in winter are sufficiently cold to cause the precipitation to be in the form of snow. At times as far south as New Orleans they have snow, but only when the juxtapositions of the highs and lows are favorable. In the midway States the storm often commences with snow and ends with rain, for the reason that the low that has brought the storm or snow is the while traveling toward the north, and this being the case the south winds that follow in the wake of the low so increase the temperature that rain is apt to follow or the snow soon to melt.

In discussing the weather problem some writers have made the statement that it would seem that it was full time that the wise men in this department should, ere this, have discovered some way by which we can control or regulate the weather, and by their remarks imply that those who know so much about the weather must be wanting in their knowledge of the subject, or in the practical application thereof, because they have not thus far been able to even suggest any plausible plan whereby to control the weather. Claims have been made for some men that they have by various mechanical appliances in miniature produced rain, and have by bombarding the sky caused precipitation. To those unacquainted with the revelations of the weather map this seems plausible. But their miniature performances, within some enclosed apartment, is of no value, and as for bombarding the sky it was a few years ago extensively tried and failed—failed even when a low was passing very near the locality of the firing. In their plan they did not consider the fact that there was no moisture to speak of within an area of high or the clear sky centre. In order to regulate the weather the first thing to do would be to regulate the sunshine; the next step to cause the earth to reverse its direction and change its path. The third step would be to regulate the highs and lows, where and how they shall enter the territory of the continent, the lines on which they shall travel, the outlines of the gradients, and the contour of the centres of the highs and lows. After they have succeeded in doing this, then they may be in position to develop some plan whereby they may think it pos-

WEATHER SIGNALS

sible to carry out their ideas along this line. But they must first change and remodel the whole face of nature.

While low is the storm centre, that is, the centre that causes the winds, and thereby concentrates the clouds, the precipitation does not always take place at this centre, but oftentimes before it reaches the centre, or about midway between the high and the low. When the clouds become sufficiently heavy they precipitate and do not wait until they have reached the centre. The centre is the active agent in bringing them toward a central point; sometimes they pass on to the centre, and other times they do not, and when they do not there will even be no rain at the centre that has been the means of bringing the clouds toward that point. In the fall of the year we have a number of weeks of fine weather—cool, yet not severely cold—cool nights and perhaps frosty mornings, but during the day it will be mild, hazy and even smoky. The conditions that produce this effect may graphically be described under the head of gradients far apart—moderate and extensive areas of high and low, with the low to the north, say on a line of 50 N. L., and the moderate high covering the area of the Southern States, say to the south of the old Mason and Dixon's line. This phenomenon, under favorable conditions and slight variations, also produces the fine atmospheric effects, that come under the head of "red-sky" morning as well as evening.

The high produces the clear sky, with a minimum of moisture, and the north low produces the warmth, or moderate heat, for reason of the south winds. This fall condition, with the gradients far apart, gave rise to the beautiful and ideal term "Indian summer"; and as the mild winds were from the south, the "Sweet Southwest," with the Indian became an ideal of a glorious condition which they thought, in some mysterious way, to be associated with the locality whence the balmy breezes came. They did not know, and we did not know until we had the weather map, that those balmy breezes from the south are caused by the gentle low far to the north. So the "Indian summer" is a happy combination of the more delightful northern and southern forces in the fall of the year, when the gradients are far apart.

The term "equinoctial storms" seems to be difficult to eradicate. But, if at the seasons of the year when these storms are supposed to occur, one will consult the weather map, he will see that it does not then indicate, over the whole country any extraordinary condition of the highs and lows. At the time of the vernal and autumnal equinox there may be a low coming up from the West Indies, or from Mexico, traveling toward the northeast; if so, it will produce a storm along the Atlantic coast. But the lows that produce these storms often approach and pass without regard to the position of the sun in the ecliptic. If there was any truth in this old idea, then there should at these times, be some peculiar condition of the factors high and low, whereby there would be a general storm all over the country, and not merely a local disturbance along the coast. What gave rise to this belief is evidently the lows that, during the spring and fall, come up from the South, and at times produce the severe storms along the Atlantic seaboard. But there is nothing regular or general about these storms.

Sometimes we have them along the Atlantic coast and sometimes not, and as to time, they have no connection with the sun "crossing the line." Without regard to the vernal or autumnal equinox the highs and lows move over the country in their peculiar way, and they have no respect for special points in the equinox, or even for "sun-spots," the moon, or the conjunction of planets. For the so-called "equinoctial storm" there is no foundation, and it has no connection with scientific truth. This idea had its origin in older times, before we had the facts in the case, but the facts as now known, place the whole subject of the weather upon an entirely new basis.

While on the land the paths of the lows are very irregular, and oftentimes take a zigzag line; on the ocean they seem to travel on very straight lines. Their course on the land is evidently due to the irregularity of the earth's surface—hills, valleys, and water in the form of lakes and rivers; while on the ocean it is all one condition practically—one great extensive plain of water, or only one element. Then on the ocean we have not the essential stations that we have on the land, therefore it is not so easy to be exact in our observations. The storms over the ocean are tracked by the observations made upon the great ocean steamers that ply between Europe and America. From the evidence of their "logs" the data are formulated, and the tracks of the storms laid down.

The statements herein made are based upon the observations made in the northern hemisphere. Up to date no such observations have been furnished by the southern hemisphere. But from what we know of nature, the same laws that govern one hemisphere must govern the other; though to the south of the equator, the polar or cold winds are reversed. There, the south winds must be the cold ones, while the winds in that hemisphere from the north must be the warm ones. Otherwise we think that the conditions must be the same. If we desire to know anything, and all, about the weather, the weather map is the only source. On this wonderful illuminator are revealed all the phenomena connected with what we term the weather. By this map and by it alone, can we comprehend the mysteries in the department of nature that we class under the head of Meteorology.

ISAAC P. NOYES,
Washington, D. C.

Weather Signals, in the United States Weather Bureau, are signals for announcing the approach of storms. They are as follows:

A cautionary signal (displayed only at stations on the Lakes).—A red flag (eight feet square) with white centre (four feet square) indicates that the winds expected will not be so severe but well-found seaworthy vessels can meet them without danger.

A storm signal.—A red flag (eight feet square) with black centre (three feet square) indicates that the storm is expected to be severe.

A red pennant (five feet hoist and 12 feet fly) displayed with the flags indicates east winds—that is, from northeast to south, inclusive, and that the storm centre is approaching.

A white pennant (five feet hoist and 12 feet fly) displayed with the flags indicates west winds—that is, from north to southwest, inclusive, and that the storm centre has passed.

When red pennant is hoisted above cautionary or storm signal, winds are expected from the northeast quadrant; when below, from the southwest quadrant.

When white pennant is hoisted above the cautionary or storm signal, winds are expected from the northwest quadrant; when below, from the southwest quadrant.

Night signals.—By night a red light will indicate

WEAVER BIRDS (*Ploceus franciscanus*).

WEATHERFORD — WEAVING

east winds; a white above a red light will indicate west winds.

The Information Signal consists of a red pennant and indicates that the displayman has received information of a storm covering a limited area, dangerous only for vessels about to sail to certain points. The signal will serve as a notification to shipmasters that important information will be given them upon application.

Weatherford, weth'ér-förd, Texas, city, county-seat of Parker County; on a branch of Trinity River, and on the Gulf, C. & S. F. (Atchison, Topeka & Santa Fé), the Weatherford, M. W. & N., and the Texas & P. R.R.'s; about 65 miles west of Dallas. It was settled in 1850 by persons from east Texas and the older States. In 1856 it was incorporated, and in 1858 chartered as a city. It is in an agricultural and stock-raising region; wheat, cotton, and corn are among the principal productions. In 1900 (government census) the city had 83 manufacturing establishments. The chief manufactures are oil mills, cotton mills, cotton compress, ice factory, machine shops, and the light-plant. There are 10 churches. The educational institutions are Texas Female Seminary (Cumberland Presbyterian), Weatherford College (M. E. South), a high school, established in 1885, Saint Joseph's Academy, Hughey and Turner School, public and parish graded schools. The three banks have a combined capital of \$150,000. The government is vested in a mayor and a board of aldermen consisting of eight members. The majority of the inhabitants are American born; about 7 per cent are of Mexican and French descent and 3 per cent are colored.

AARON SMITH,
Editor, 'Democrat.'

Weatherly, weth'ér-li, **Frederic Edward**, English song writer and barrister: b. Portshead, Somerset, 4 Oct. 1848. He was graduated from Oxford in 1871 and was called to the bar of the Inner Temple in 1887. He is widely known as the writer of popular songs, many of which have been given musical settings. Among them are 'Nancy Lee'; 'Polly'; 'Three Old Maids of Lee'; 'Darby and Joan.' Of his published volumes mention may be made of 'Muriel and Other Poems' (1870); 'Wilton School' (1872); 'Oxford Days' (1879); 'Rudiments of Logic' (1879); 'Questions in Logic, Progressive and General' (1883); 'Two Children' (1884); 'Lays for Little Ones' (1898).

Weaver, we'ver, **Aaron Ward**, American naval officer: b. District of Columbia, 1 July 1832. He was graduated at the United States Naval Academy in 1854; became lieutenant in 1855 and in 1858-9 cruised along the African coast in the sloop Marion, and returned in command of the prize slaver *Ardennes*. He served in the Union army with distinction through the Civil War, made commander in 1866; captain in 1876; and rear-admiral in 1893; and was retired in September of the year last named.

Weaver, James Baird, American political leader: b. Dayton, Ohio, 12 June 1833. He was graduated from the Law School of Ohio University in 1854; and began the practice of law in Iowa. In 1861 he entered the Union army, was promoted colonel in 1862, and brevetted brigadier-general in 1865. In 1866-70 he was district attorney of the 2d judicial district of Iowa; and in 1867-73 assessor of internal revenue for the 1st Iowa district. For some time he was editor of the *Iowa Tribune*, published at

Des Moines. He took an active part in the organization of the Greenback party, and was elected to Congress on its ticket in 1879, serving one term; in 1880 he was the Greenback candidate for President, receiving over 300,000 popular votes. Later he was affiliated with the People's Party, was a delegate to the National Convention in 1892, and was again nominated for the presidency, receiving over 1,000,000 popular votes. Since 1895 he has lived in Colfax, Iowa; and was elected mayor of that city in 1902. He wrote 'A Call to Action' (1892).

Weaver-bird, a bird of the family *Ploceidae* remarkable for their nests. The family is a large one and is confined to the warmer parts of the Old World, Africa being particularly rich in species. Weaver-birds closely resemble large finches, with somewhat elongated bodies, moderate wings, which have the outer primary quill better developed than in the *Fringillida*, long tails, and very bright plumage, the latter often varied in the breeding season. Yellow and yellowish red are the prevailing tints, but species occur in which black, red, white, or gray predominates. The weaver-birds are extremely social, and many of the species live in large colonies during the period of incubation.

The nests of the various species differ considerably in shape and general structure, some (as the genus *Oriolinus*), building a separate nest for the male, while the female sits in another on her eggs, till relieved by her mate; others again contain more than one chamber, as that of the golden weaver-bird (*Ploceus galbula*); while the social weaver-birds (*Philaterus socius*) construct an umbrella-like roof, under which from 800 to 1,000 separate nests have been found. But in all cases fibres, slender twigs, or blades of grass are the materials employed, the whole being tightly woven, after having been rendered more flexible and adhesive by the application of saliva. In some cases the birds of a pair take positions on opposite sides of the structure and the fibres are passed through and through from one to the other. The nests themselves consist of a more or less globular portion, elongated into a tube below, with the entrance at the bottom or at the side. They are very generally suspended at the extremities of branches, and often over water, probably as affording security against monkeys, snakes, and other enemies. The Mahali weaver (*P. taha*) is said to insert thorns into its nest, as a further protection against marauders. A Philippine species (*Ploceus Philippinus*) builds flask-shaped nests of fine roots suspended mouth downward by long ropes of similar construction from the boughs of trees. Consult Bartlett, 'Monograph of the Weaver-birds' (Maidstone 1888).

Weaving, the art of interlacing yarn threads or other filaments by means of a loom, so as to form a web of cloth or other woven fabric. In this process two sets of threads are employed, which traverse the web at right angles to each other. The first set extends from end to end of the web in parallel lines, and is commonly called the warp; while the other set of threads crosses and interlaces with the warp from side to side of the web, and is generally called the weft or woof. In all forms of weaving the warp threads are first set up in the loom, and then the weft threads are worked into the warp, to and fro, by means of a shuttle. It

was by this fundamental process of interlacing two sets of thread in looms of simple mechanism that the mummy cloths of Egypt, the fine damasks and tapestries of the Greeks and Romans, the Indian muslins, the shawls of Cashmere, and the famed textile fabrics of Italy and the Netherlands were produced.

Hand Looms.—Until comparatively modern times all weaving was effected by means of the hand loom. This loom, in its latest form, consists of a frame of four upright posts braced together by cross-beams, the centre beam at the back being the warp beam, the beam in front being that upon which the web is wound, while just below this, in front, is the breast-beam for the support of the weaver at his work. At the top of the loom is an apparatus by which the heddles are lifted or lowered by means of treadles under the foot of the weaver. These heddles consist of two frames, from which depend cords attached by a loop or eye to each thread in the warp. As these threads are attached to the frames, alternately, it follows that when one heddle is raised every second thread in the warp is also raised, while the remaining threads are depressed; and this is called shedding the warp. When the warp threads are thus parted there is left a small opening or shed between the threads, and it is through this opening that the weaver drives his shuttle from side to side. The shuttle, which is hollow in the middle, contains the weft-thread wound round a bobbin or pirn, and as the shuttle is shot across the web this weft-thread unwinds itself. When the thread is thus introduced it is necessary to bring it to its place in the fabric. This is accomplished by means of the lay or batten, which is suspended from the top of the loom, and works to and fro like a pendulum by an attachment of vertical rods at each side called the swords. Attached to the lay is what is called the reed, which is a sort of comb having a tooth raised between every two threads of the warp, and so by driving up the lay after a weft-thread has been introduced the weaver strikes home that thread to its place in the cloth.

The Fly Shuttle.—A great improvement was made upon the hand loom when John Kay about 1740 invented the fly-shuttle, as it was called. This enabled the weaver to drive the shuttle both ways with the right hand by means of a cord attached to a box or trough placed at each end of the shuttle-race, which impelled the shuttle to and fro at each jerk of the cord. But the most important improvement was made on the hand-loom by Joseph Jacquard of Lyons, who, in 1801, invented an apparatus by which the most intricate patterns could be woven as readily as plain cloth. This is accomplished by an ingenious arrangement of hooks and wires, by means of which the warp threads are lifted in any order and to any extent necessary to make the shedding required by the pattern. The order in which these hooks and wires are successively lifted and lowered is determined by means of a series of pasteboard cards punctured with holes, the holes corresponding to a certain pattern and the cards passing successively over a cylinder or drum. The hooked wires pass through these holes and lift the warp-threads in an order which secures that the arranged pattern is woven into the fabric. When the pattern is extensive the machine may be provided with as many as 1,000 hooks and wires.

Power Looms.—Another development was made in the art of weaving by the invention of the power loom by the Rev. E. Cartwright in 1784. In the power loom, which has been gradually improved and adapted to steam and electric power, the principal motions of the old method of weaving, such as shedding the warp threads, throwing the shuttle, and beating up the thread, are still retained. The frame of the power loom is of cast iron, and motion is communicated to the loom by means of a shaft, the stroke of the lay being made by cranks attached to the driving shaft, while the shuttle is thrown by means of a lever attachment at the centre of the loom. Although the principle of the loom is the same in all kinds of weaving, yet there are numberless modifications for the production of special fabrics. The lappet loom is one suitable for weaving either plain or gauze cloths, and also for putting in representations of flowers, birds, or the like.

Cross Weaving is a term applied to that process in which, as in gauze weaving, the warp-threads, instead of lying constantly parallel, cross over or twist around one another, thus forming a plexus or interlacing independent of that produced by the weft.

Double Weaving consists in weaving two webs simultaneously one above the other, and interweaving the two at intervals so as to form a double cloth. Kidderminster or Scotch carpeting is the chief example of this process.

Pile Weaving is the process by which fabrics like that of velvets, velveteens, corduroy, and Turkey carpets are produced. In the weaving of these fabrics, besides the ordinary warp and weft, there is what is called the pile-warp, the threads of which are left standing in loops above the general surface till cut, and the cutting of which constitutes the pile.

Webb, Alexander Stewart, American soldier and educator: b. New York 15 Feb. 1835. He was graduated from West Point in 1855, was assistant professor of mathematics there in 1857-61, and at the outbreak of the Civil War became major of the 1st Rhode Island Infantry. He participated in the defense of Fort Pickens, was at the first battle of Bull Run, served in the Peninsular campaign and in 1863 became brigadier-general of volunteers. At Gettysburg he assisted in repulsing Pickett's charge and received a Congressional medal of honor in recognition of his gallantry. He was engaged in the Rapidan and the Wilderness campaigns, was wounded at Spottsylvania, and upon his return to duty was appointed chief-of-staff to General Meade. He received brevet rank as major-general of volunteers in 1864, and was brevetted brigadier-general of regulars in 1865. In 1866 he was promoted lieutenant-colonel, was brevetted major-general in the regular army in 1869, and in 1870 at his own request received an honorable discharge. He was president of the College of the City of New York in 1869-1903, and wrote: 'The Peninsula: McClellan's Campaign of 1862' (1882).

Webb, Aston, English architect: b. London 22 May 1849. He was educated in private schools, was articled to Messrs. Banks and Barry, architects, and began practice in 1873. He was the architect for the completion of the Victoria and Albert Museum and the Royal College of Science, South Kensington; the Britan-

nia Naval College, Dartmouth, and the architectural accessories for the Victoria Memorial before Buckingham Palace. He has designed many churches, commercial structures, and mansions, and, with E. I. Bell, the Victoria Courts, Birmingham; the Birmingham University and the new schools of Christ's Hospital. He was president of the Architectural Association in 1884, and vice-president of the Royal Institute of British Architects 1893-7.

Webb, Charles Henry (pen name "JOHN PAUL"), American journalist and humorist: b. Rouse's Point, N. Y., 24 Jan. 1834. He went to sea when young, was on the staff of the New York *Times* (1860-3), and going to California in 1863 founded the 'Californian,' San Francisco, which he edited till 1866. Subsequently he contributed to the New York *Tribune* humorous articles signed "Jean Paul." He invented an adding machine, but is better known by his burlesque dramas, among which are 'Lif-fith Lank' (1867), and 'Saint Twel' Mo' (1868). Other works by him are: 'John Paul's Book' (1874); 'Parodies, Prose, and Verse' (1876); 'Vagrom Verse' (1889); 'More Vagrom Verse' (1901).

Webb, James Watson, American journalist and author: b. Claverack, N. Y., 8 Feb. 1802; d. New York 7 June 1884. He entered the United States army as 2d lieutenant, and became adjutant in 1825; served in the West under General Scott; and resigned from the army in 1827. In that year he became editor of the *Morning Courier* in New York; this was united with the *Inquirer* as the *Courier and Enquirer*, which he edited until 1861, when it was merged in the New York *World*. At first he supported Jackson but later as vigorously opposed Jackson's measures, and made the *Courier and Enquirer* one of the leading Whig papers. In 1851 he was appointed engineer-in-chief of New York State, and given the rank of major-general. After refusing an appointment as minister to Turkey, he was appointed minister to Brazil in 1861, which office he held until 1869. In 1865, when he was in France for a time, he negotiated a secret treaty with the emperor providing for the removal of the French troops from Mexico. He wrote 'Altowan, or Incidents of Life and Adventure in the Rocky Mountains' (1846); 'Slavery and its Tendencies' (1856); and 'National Currency' (1875).

Webb, Samuel Blatchley, American soldier: b. Wethersfield, Conn., 15 Dec. 1753; d. Claverack, N. Y., 3 Dec. 1807. He joined the Revolutionary army immediately after the battle of Lexington, was engaged at Bunker Hill, became aide to General Putnam, and in June 1776 was appointed private secretary and aide-de-camp to Washington, receiving rank as lieutenant-colonel. He was engaged at the battles of Long Island, White Plains, Trenton, and Princeton, and in 1777 took command of the 3d Connecticut regiment which he had organized, equipping it almost entirely from his own funds. He accompanied General Parson's expedition to Long Island in 1777, and on 10 December was captured with his command. He remained a prisoner until 1780, when he was appointed to succeed Baron Steuben in command of the light infantry, with brevet rank of brigadier-general. He was one of the 16 founders of the Society of the Cincinnati in 1783, and in 1789 held the

Bible on which Washington took the oath as first President of the United States.

Webb, Sidney, English political economist and Fabian socialist: b. London 13 July 1859. He was educated in Switzerland and at the City of London College, and in 1878 entered the civil service, holding several different positions chiefly in the colonial office, and resigning from the service in 1891. He was admitted to the bar in 1885. He was one of the founders of the Fabian Society (q.v.), and in 1891 was elected to the London County Council as a candidate endorsed by the Fabian Socialists. He is lecturer on political economy at the London School of Economics and Political Science, and is a member of the Economic Faculty of London University. He has written 'Socialism in England' (1890); 'The Eight Hours' Day' (1891, with Harold Cox); 'The London Programme' (1892); 'Labor in the Longest Reign' (1897); and in collaboration with his wife, Beatrice Potter Webb, 'The History of Trade Unionism' (1894); 'Industrial Democracy' (1897); and 'Problems of Modern Industry' (1898). 'The History of Trade Unionism' is an exhaustive account of the origin and progress of the English labor unions; 'Industrial Democracy' shows the organization and ideals of the modern British trades unions. These two works form the most valuable contribution to the history of English labor; and written with sympathy and forcible directness, well express the power and vitality of the labor movement.

Webb City, Mo., city in Jasper County; on the Missouri P., the Saint Louis & S. F., and the Kansas City, F. S. & M. R.R.'s; about 10 miles south by west of Carthage. It is in an agricultural and fruit-growing region, and near by are valuable deposits of lead and zinc. It is the commercial and industrial centre for an extensive mining section as well as for a large farm section. The mining products which are shipped from this city are quite large. The chief manufacturing establishments are foundry and machine shops, lumber mills, flour mills, mining machinery and machinery for oil wells. It has 10 churches, a high school (building cost \$30,000), graded elementary schools. The water-works system cost originally \$100,000. The two banks have a combined capital of \$70,000. Pop. (1880) 1,588; (1890) 5,043; (1900) 9,201.

Webb-Pep'loe, Hanmer William, English Anglican clergyman: b. 1837. He was educated at Cambridge, took orders in the English Church and has been vicar of Saint Paul's, Onslow Square, London, from 1876, and prebendary of Saint Paul's Cathedral since 1893. Among his writings are: 'I Follow After'; 'All One in Christ Jesus'; 'The Life of Privilege'; 'Calls to Holiness.'

Webber, wëb'ër, Charles Wilkins, American author: b. Russellville, Ky., 29 May 1819; d. Nicaragua 11 April 1856. In early youth he passed several years of adventurous life on the Texan frontier, and later settled in New York where he was for a short time assistant editor of the 'American Review,' and a prolific contributor to that and the 'Democratic Review' and other periodicals, in which appeared in a serial form his 'Old Hicks the Guide,' and other tales of backwoods life and adventure. In 1849

he published the 'Gold Mines of the Gila.' His remaining works comprise the 'Hunter Naturalist' (1851); 'Spiritual Vampirism' (1853); 'Tales of the Southern Border' (1853); and 'Wild Scenes and Song Birds' (1854), forming a second volume of the 'Hunter Naturalist.' In 1856 he joined an expedition to Nicaragua in aid of William Walker (q.v.), and was killed in a skirmish.

Webber, Samuel, American college president: b. Byfield, Mass., 1759; d. Cambridge, Mass., 17 July 1810. He was graduated at Harvard in 1784, subsequently entered the ministry, and in 1787 was appointed university tutor of mathematics. In 1789 he was appointed to the chair of mathematics and natural philosophy, which he retained until the death of President Joseph Willard in 1804, when he became his successor. He died while holding this office. He was one of the commissioners appointed to determine the boundary between the United States and the British provinces, and published 'A System of Mathematics' (1801).

Weber, wē'bēr, Adna Ferrin, American statistician: b. Springville, Erie County, N. Y., 14 July 1870. He was graduated from Cornell in 1894, studied social science in Europe, was deputy commissioner of labor statistics of New York 1899-1901, and has been chief statistician of New York State Labor since 1901. He has published 'The Growth of Cities in the 19th Century' (1899); and statistical reports on labor.

Weber, vā'bēr, Ernst Heinrich, German physiologist: b. Wittenberg, Germany, 24 June 1795; d. Leipsic, Germany, 26 Jan. 1878. He was educated at Leipsic, was appointed professor of comparative anatomy there in 1818, and of physiology in 1840. He originated the formula known as Weber's Law (q.v.) and wrote: 'Anatomia Comparativa Nervi Sympathici' (1817); 'Lehre vom Bau und von der Verrichtung der Geschlechtsorgane' (1846); 'Annotationes Anatomicae et Physiologicae' (1851); etc.

Weber, Georg, German historian: b. Bergzabern, Rhenish Bavaria, 10 Feb. 1808; d. Heidelberg 10 Aug. 1888. He was educated at Erlangen, traveled extensively, and was director of the normal school at Heidelberg in 1848-72. His writings, which include: 'Lehrbuch der Weltgeschichte' (1847); 'Geschichte der deutschen Litteratur' (1847); 'Allgemeine Weltgeschichte für die gebildeten Stände' (15 vols. 1857-80); etc.

Weber, Karl Maria (Friedrich Ernst), BARON VON, German composer: b. Eutin, Grand Duchy of Oldenburg, 18 Dec. 1786; d. London 5 June 1826. He was a pupil of J. P. Heuschkel of Hildburghausen, attaining great skill as a pianoforte virtuoso and much proficiency in the technique of composition; and continued his studies with Michael Haydn at Salzburg, and at Munich with Kalcher (harmony and composition) and Valesi (singing). His opera, 'Das Waldmädchen,' was produced with but moderate success at Freiberg, though more fortunate at Chemnitz and (in 1805) at Vienna. A second opera, 'Peter Schmolli und seine Nachbarn,' first presented at Augsburg (1803) met with no particular approval. Early in 1803 he went to Vienna, and there that curious genius, the Abbé Vogler, was for a year his instructor. By Vog-

ler's aid, he secured the post of kapellmeister of the opera at Breslau (1804). He displayed great ability as an organizer and director, but resigned in 1806, and became musical director to Prince Eugene of Würtemberg at Karlsruhe, Silesia. In 1807 he entered the service of Duke Louis of Würtemberg at Stuttgart as private secretary, and in 1808-10 was working on his first larger opera, 'Silvana,' the libretto of which was to a large extent based on that of his earlier 'Waldmädchen.' He was falsely charged with fraud, and despite all lack of evidence against him, was perpetually banished from Würtemberg 26 Feb. 1810. Then he went to Mannheim, where his first symphony was most favorably received, and his piano-playing was also very successful; and thence to Darmstadt, where he once more became a pupil of Vogler. His comic operetta, 'Abu Hassan,' was completed in 1810 and given at Munich, and 'Silvana,' with additions, gained adequate recognition at Berlin in 1812. It was not, however, until 1813 that Weber held an important appointment; in that year he was made kapellmeister of the Prague opera, and there proved himself the first of the great German musicians to be conspicuous also as a conductor. His administration of marked success was brought to a close by his giving it up in 1816. His chief compositions of this period were settings of Körner's songs, and the cantata 'Kampf und Sieg,' founded on the battle of Waterloo. In 1816 he went to Dresden, where previously Italian opera had held undisputed sway, to organize the new venture of German opera; and soon he had attained, except among a few partisans, an unqualified victory. The appointment was confirmed for life, and he was frequently summoned to direct the music of the chapel royal. He became widely known with the presentation of his opera, 'Der Freischütz,' at Berlin 18 June 1821, which was quickly echoed elsewhere, being simultaneously given in London in three different places. Few operatic works, it is said, have equaled it in immediate triumph. 'Euryanthe' did not meet similar approval at Vienna (1823), though appreciation was duly encountered in Dresden, Leipsic, and Berlin. On the commission of Charles Kemble of Covent Garden, London, he wrote 'Oberon' to an English libretto by J. R. Planché, himself learning English to be able to work to better effect. He conducted the first 12 performances, and after a reception which almost surpassed that of the 'Freischütz,' played at numerous concerts. With the 'Freischütz,' which struck a distinctively national note, Weber became the founder of what is known as the romantic school of German opera. He has been claimed as a predecessor of Wagner in adapting his music to the dramatic requirements, and the use of leading motives. In his operatic works he apparently preferred legendary and supernatural elements, which he could make musically effective. Though his operas are the best known of his writings, he did musicianly and even brilliant work in the direction of Lieder and pianoforte compositions. Consult: Jähns, 'C. M. von Weber: Eine Lebensskizze' (1873); the biographies by Rau (1865); Benedict (1881); Reissmann (1882); and Gehrmann (1890); also Benedict, 'Musiciens du Temps Passé' (1893), and the article by Spitta in Grove's 'Dictionary,' Vol. IV. (1889).

WEBER—WEBSTER

Weber, Max Maria von, German civil engineer, son of Karl Maria von Weber (q.v.): b. Dresden, Saxony, 25 April 1822; d. Berlin, Germany, 18 April 1881. He studied engineering in Dresden and in England, and in 1850 entered the civil service of Saxony. He went to Vienna in 1870, where he was engaged in the extension of the Austrian railway system and in 1878 to Berlin on a like service. He wrote extensively, not only on technical themes, but in the field of general literature. His writings include: 'Schule des Eisenbahnwesens' (1857); 'Karl Maria von Weber: ein Lebensbild' (1864-6); 'Nationalität und Eisenbahnpolitik' (1876); etc., besides the posthumously published 'Vom rollenden Flügelrad' (1882), to which is added a biography by M. Jähms.

Weber, Wilhelm Eduard, German physicist, brother of E. H. Weber (q.v.): b. Wittenberg 24 Oct. 1804; d. Göttingen 23 June 1891. He was educated at Halle, was professor of physics at Göttingen in 1831-7, and occupied that chair at Leipzig in 1843-9, after which he resumed his chair at Göttingen. He was associated with his brothers and with Gauss in various publications concerning physics, and made valuable researches in the fields of electricity and magnetism. He also published a series of essays, 'Elektrodynamische Massbestimmungen' (1846-67). Consult Heinrich Weber, 'Wilhelm Weber' (1893).

Weber, wē'bér, a river of Utah, whose headwaters are on the west slope of the Uinta Mountains. It flows northwest through fertile lands and through a series of cañons; and after a course of nearly 200 miles it enters Great Salt Lake. The famous Weber Cañon is the gorge made by this river where it breaks through the Wasatch Mountains. The Union Pacific Railroad passes through this gorge. The descent in places is most rapid, and the consequent water-power is extensive. At Ogden, the mean volume of water is about 2,000 cubic feet a second. The Weber is much used for irrigation. The river has built up at Ogden a large delta which extends into ancient Lake Bonneville (q.v.).

Weber's Law, so called from E. H. Weber (q.v.), who, after a long series of experiments on the sensations of sight, hearing and touch, formulated the law which has since gone by his name. The principle of the law is that, in order that the sensational difference may remain unchanged, the increase of stimulus must maintain the same proportion to the intensity of the preceding stimulus, or, in order that the intensity of a sensation may increase in arithmetical progression, the stimulus must increase in geometrical progression.

Web'ster, Daniel, American orator and statesman: b. Salisbury, N. H., 18 Jan. 1782; d. Marshfield, Mass., 24 Oct. 1852. Of the generation of American statesmen that followed those of the Revolutionary period, few will live as long in the memory of the people, and none as long in the literature of the country, as Daniel Webster. His figure rises above the level of his time like a monument of colossal proportions. His father, a Puritan of stern and sterling character, had, as a backwoods farmer in New Hampshire, been an Indian fighter while New England had an Indian frontier, a soldier in the French war, and a captain in the Revo-

lutionary army. His high standing among his neighbors made him a judge of the local court. Ambitious for his children, he strained his scanty means to the utmost to give his son the best education within reach, first at Exeter Academy, then at Dartmouth College. From his earliest days Daniel was petted by good fortune. His seemingly delicate health, his genial nature, and his promising looks, put, in the family circle, everybody at his service, even at personal sacrifice; and such sacrifice by others he became gradually accustomed to expect, as a prince expects homage.

At the academy and the college he shone not by phenomenal precocity, but by rapid progress in the studies he liked,—Latin, literature, and history. He did not excel in the qualities of the genuine scholar,—patient and thorough research, and the eager pursuit of knowledge for its own sake; but he was a voracious reader, assimilating easily what he read by dint of a strong memory and of serious reflection, and soon developed the faculty of making the most of what he knew by clear, vigorous, affluent, and impressive utterance. At an early age, too, he commanded attention by a singular charm of presence, to which his great dark eyes contributed not a little; and notwithstanding his high animal spirits, by a striking dignity of carriage and demeanor,—traits which gradually matured into that singularly imposing personality, the effect of which is described by his contemporaries in language almost extravagant, borrowing its similes from kings, cathedrals, and mountain peaks.

His conspicuous power of speech caused him, even during his college days, to be drawn upon for orations on the Fourth of July and other festive days. The same faculty, reinforced by his virtue of knowing what he knew, gave him, after he had gone through the usual course of law study, early successes at the bar, which soon carried him from the field of legal practice into political life. He inherited Federalism from his father, and naturally accepted it, because he was a conservative by instinct and temperament. Existing things had a *prima facie* claim upon his respect and support, because they existed. He followed his party with fidelity, sometimes at the expense of his reason and logic, but without the narrow-mindedness of a proscriptive partisan spirit. In the excited discussions which preceded and accompanied the War of 1812, he took an active part as a public speaker and a pamphleteer. Something happened then, at the very beginning of his public career, that revealed in strong light the elements of strength as well as those of weakness in his nature. In a speech on the Fourth of July, 1812, at Portsmouth, N. H., he set forth in vigorous language his opposition to the war policy of the administration; but with equal emphasis he also declared that the remedy lay, not in lawless resistance, but only in "the exercise of the constitutional right of suffrage,"—a proposition then by no means popular with the extreme Federalists of New England. A few weeks later he was appointed by a local mass convention of Federalists to write an address on the same subject, which became widely known as the 'Rockingham Memorial.' In it he set forth with signal force the complaints of his party; but as to the remedy, he consented to give voice to the sense

WEBSTER

of the meeting by a thinly veiled threat of secession, and a hint at the possibility of a dissolution of the Union. In the first case he expressed his own opinions as a statesman and a patriot; in the second he accepted the opinions of those around him as his own, and spoke with equal ability and vigor as the mouthpiece or attorney of others: a double character, destined to reappear from time to time in his public life with puzzling effect.

New Hampshire sent him to Congress, where he took his seat in the House of Representatives in May 1813. He soon won a place in the front rank of debaters, especially on questions of finance. But the two terms during which he represented a New Hampshire constituency were a mere prelude to his great political career. In 1817 he left Congress to give himself to his legal practice, which gained much in distinction and lucrativeness by his removal to Boston. He rose rapidly to national eminence as a practitioner in the Federal as well as the State tribunals. It was there that he won peculiar lustre through his memorable argument in the famous Dartmouth College case before the Federal Supreme Court, which fascinated John Marshall on the bench, and moved to tears the thronged audience in the court-room. It left Webster with no superior and with few rivals at the American bar. It may be questioned whether he was a great lawyer in the highest sense. There were others whose knowledge was larger and more thorough, and whose legal opinion carried greater authority. But hardly any of these surpassed him in the faculty of seizing, with instinctive sureness of grasp, the vital point of a cause, of endowing mere statement with the power of demonstration, of marshaling facts and arguments in massive array for concentric attack on the decisive point, of moving the feelings together with the understanding by appeals of singular magic, and also of so assimilating and using the work of others as if it had been his own. Adding to all this the charm of that imposing personality, which made every word falling from his lips sound as if it were entitled to far more than ordinary respect, he could not fail to win brilliant successes. He was engaged in many of the most important and celebrated cases of his time—some then celebrated and still remembered because of the part he played in them.

In Boston, Webster found a thoroughly congenial home. Its history and traditions, its wealth and commercial activity, the high character of its citizenship, the academic atmosphere created by its institutions of learning, the refined tone of its social circles, the fame of its public men, made the Boston of that period, in the main attributes of civilized life, the foremost city in the United States. Boston society received Webster with open arms, and presently he became in an almost unexampled measure its idol. Together with the most distinguished personages of the State, he was elected a member of the convention called to revise the State Constitution, where as the champion of conservative principles he advocated and carried the proposition that the State Senate should remain the representative of property. When in 1820, the day arrived for the celebration of the two-hundredth anniversary of the landing of the Pilgrims on Plymouth Rock, it was he whom the public voice designated as the orator

of the day. The oration, with its historical picturesqueness, its richness of thought and reasoning, its broad sweep of contemplation, and the noble and magnificent simplicity of its eloquence, was in itself an event. No literary production of the period in America achieved greater renown. From that time on, Massachusetts loved to exhibit herself in his person on occasions of state; and in preference to all others, Webster was her spokesman when she commemorated the great events of her history. As such he produced a series of addresses—at the laying of the corner-stone, and later at the completion, of the Bunker Hill monument, on the death of John Adams and of Thomas Jefferson, and on other occasions—which his contemporaries acclaimed as ranking with the great oratorical achievements of antiquity.

Webster soon appeared in Congress again: first in 1823, in the House of Representatives, as the member from the Boston district; and a few years later in the Senate. Then began the most brilliant part of his political career. It was the period when the component elements of the old political parties—the Federalists and the Republicans—became intermingled; when old party issues vanished; and when new questions, or rather old questions in new shapes and relations, caused new groupings of men to be formed. In the confusion of the political and personal conflicts which characterized the so-called "era of good feeling," and which immediately followed it, Webster became a supporter of the administration of John Quincy Adams; and, as an old Federalist and conservative, was naturally attracted by that combination of political forces which subsequently organized itself as the Whig party.

In the House of Representatives he attracted the attention of the world abroad by a stinging philippic against the "Holy Alliance" in a eulogy on the Greek revolution, and by a sober exposition of the Monroe Doctrine in a speech on the famous Panama mission. But his most remarkable achievement was an argument against Henry Clay's "American System"—tariff protection as a policy, the very policy which was destined to become the corner-stone of the Whig platform. Webster's Free Trade speech—for so it may be called—summed up and amplified the views he had already expressed on previous occasions, in a presentation of fundamental principles so broad and clear, with a display of knowledge so rich and accurate, and an analysis of facts and theories so keen and thorough, that it stands unsurpassed in our political literature, and may still serve as a text-book to students of economic science. But Clay's tariff was adopted nevertheless; and four years later Webster abandoned many of his own conclusions, on the ground that in the meantime New England, accepting protection as the established policy of the country, had invested much capital in manufacturing enterprises, the success of which depended upon the maintenance of the protective policy, and should therefore not be left in the lurch. For this reason he became a protectionist. This plea appeared again and again in his high-tariff speeches which followed; but he never attempted to deny or shake the broad principles so strongly set forth in his great argument of 1824.

Webster reached the highest point of his power and fame when, in 1830, he gave,

WEBSTER

as a member of the Senate, voice as no one else could to the national consciousness of the American people. Before the War of 1812, the Union had been looked upon by many thoughtful and patriotic Americans as an experiment,—a promising one indeed, but of uncertain issue. Whether it would be able to endure the strain of divergent local interests, feelings, and aspirations, and whether its component parts would continue in the desire permanently to remain together in one political structure, were still matters of doubt and speculation. The results of the War of 1812 did much to inspire the American heart with a glow of pride in the great common country, with confident anticipations of its high destinies, and with an instinctive feeling that the greatness of the country and the splendors of its destinies depended altogether upon the permanency of the Union. The original theory that the Constitution of the United States was a mere compact of partnership between independent and sovereign commonwealths, to be dissolved at will, whatever historical foundation it might have had, yielding to an overruling sentiment of a common nationality. This sentiment was affronted by the Nullification movement in South Carolina, which, under the guise of resistance to the high tariff of 1828, sought to erect a bulwark for slavery through the enforcement of the doctrine that a State by its sovereign action could overrule a Federal law, and might, as a last resort, legally withdraw from the "federal compact." Against this assumption Webster rose up in his might, and in his famous "Reply to Hayne" struck down the doctrine of the legality of State resistance and of secession with blows so crushing, and maintained the supremacy of the Federal authority in its sphere, and the indissolubility of the Union, with an eloquence so grand and triumphant, that as his words went over the land the national heart bounded with joy and broke out in enthusiastic acclamations. At that moment Webster stood before the world as the first of living Americans. Nor was this the mere sensation of a day. His "Liberty and Union, now and forever, one and inseparable!" remained the watchword of American patriotism, and still reverberated 30 years later in the thunders of the Civil War. That glorious speech continues to hold the first place among the monuments of American oratory. In the contest against the Nullification movement in South Carolina, Webster firmly maintained, against Henry Clay's compromise policy, that wherever the national authority was lawlessly set at defiance, peace should never be purchased by concession to the challengers; and that it was time to "test the strength of the government." He therefore sturdily supported President Jackson's "Force Bill," although the administration of that doughty warrior was otherwise most uncongenial to him. But when the compromise had actually been adopted, he dropped back into the party line behind Clay's leadership, which he henceforth never again forsook. There was an element of indolence in his nature which it needed strong impulses to overcome, so as to set the vast machinery of his mind in full motion. Such an impulse was furnished again by Jackson's attack on the United States Bank, and by other somewhat autocratic financial measures. Webster opposed this policy in a series of

speeches on currency and banking, which deserve very high rank in the literature of that branch of economics. They were not free from partisan bias in the specific application of those fundamental principles of which Webster had such a masterly grasp; but notwithstanding this, his deep insight into the nature and conditions of credit, and his thorough study and profound judgment of the functions of banking, made him an invaluable teacher of the science of public finance. Nobody has ever depicted the vices and dangers inherent in an unsound currency, and the necessity of grounding the monetary system upon a firm basis of value, with greater force and more convincing lucidity.

But in spite of the brilliancy and strength of his efforts in opposing Jackson's wilful and erratic policies, Webster never became the real leader of the Whig party. Although greatly the superior of Clay in wealth of knowledge, in depth of thought, in statesmanlike breadth of view, in solidity of reasoning power, and in argumentative eloquence, he fell far behind him in those attributes which in contests for general leadership are apt to turn the scale: the spirit of initiative, force of will, that sincere self-confidence which extorts confidence from others, bold self-assertion in doubtful situations, and constant alertness in watching and directing the details of political movements. Clay therefore remained the general leader of the Whig party; while Webster, with New England at his back, stood now by his side, now behind him, as in feudal times a great duke, rich in treasure and lands and retainers, himself of royal blood, may have stood now behind, now by the side of his king. Unhappily for himself, Webster was not satisfied with the theatre of action on which his abilities fitted him for the greatest service, and on which he achieved his highest renown. At a comparatively early period of his career he ardently wished to be sent as minister to England; and he bore a grudge to John Quincy Adams for his failure to gratify that desire. Ever since his "Reply to Hayne" had made his name a household word in the country, an ungovernable longing possessed him to be President of the United States. The morbid craving commonly called "the Presidential fever" developed in him, as it became chronic, its most distressing form; disordering his ambition, unsettling his judgment, and warping his statesmanship. His imagination always saw the coveted prize within his grasp, which in reality it never was. He lacked the sort of popularity which since the administration of John Quincy Adams seemed to be required for a Presidential candidacy. People listened to him with rapture and wonder; but as to the Presidency, the fancy and favor of the politicians, as well as of the masses, obstinately ran to other men. So it was again and again. Clay, too, was unfortunate as a Presidential candidate; but he could obtain at least the nomination of his party so long as there appeared to be any hope for his election. Webster was denied even that. The vote for him in the party conventions was always distressingly small—usually confined to New England, or only a part of it. Yet he never ceased to hope against hope, and thus to invite more and more galling disappointments. To Henry Clay he could yield without humiliation; but when he saw his party prefer to himself not

once, but twice and three times, men of only military fame, without any political significance whatever, his mortification was so keen that in the bitterness of his soul he twice openly protested against the result.

The cause of this steady succession of failures may have been, partly, that the people found him too unlike themselves, too unfamiliar to the popular heart; and partly that the party managers shrunk from nominating him because they saw in him not only a giant, but a very vulnerable giant, who would not "wear well" as a candidate. They had indeed reason to fear the discussions to which in an excited canvass his private character would be subjected. Of his moral failings, those relating to money were the most notorious and the most offensive to the moral sense of the plain people. In the course of his public life he became accustomed not only to the adulation but also to the material generosity of his followers. Great as his professional income was, his prodigality went far beyond his means; and the recklessness with which he borrowed and forgot to return, betrayed an utter insensibility to pecuniary obligation. With the coolest nonchalance he spent the money of his friends, and left to them his debts for payment. This habit increased as he grew older, and severely tested the endurance of his admirers. So grave a departure from the principles of common honesty could not fail to cast a dark shadow upon his character, and it is not strange that the cloud of distrust should have spread from his private to his public morals. The charge was made that he stood in the Senate advocating high tariffs as the paid attorney of the manufacturers of New England. It was met by the answer that so great a man would not sell himself. This should have been enough. Nevertheless, his defenders were grievously embarrassed when the fact was pointed out that it was after all in great part the money of the rich manufacturers and bankers that stocked his farm, furnished his house, supplied his table, and paid his bills. A man less great could hardly have long sustained himself in public life under such a burden of suspicion. That Daniel Webster did sustain himself, strikingly proved the strength of his prestige. But his moral failings cost him the noblest fruit of great service,—an unbounded public confidence. Although disappointed in his own expectations, he vigorously supported General Harrison for the Presidency in the campaign of 1840, and in 1841 was made secretary of state. He remained in that office until he had concluded the famous Ashburton Treaty, under the administration of President Tyler, who turned against the Whig policies. After his resignation he was again elected to the Senate. Then a fateful crisis in his career approached.

The annexation of Texas, the Mexican war, and the acquisition of territory on our southern and western borders, brought the slavery question sharply into the foreground. Webster had always, when occasion called for a demonstration of sentiment, denounced slavery as a great moral and political evil; and although affirming that under the Constitution it could not be touched by the action of the general government in the States in which it existed, declared himself against its extension. He had opposed the annexation of Texas, the war against Mexico, and the enlargement of the republic by

conquest. But while he did not abandon his position concerning slavery, his tone in maintaining it grew gradually milder. The impression gained ground that as a standing candidate for the Presidency, he became more and more anxious to conciliate Southern opinion. Then the day came that tried men's souls. The slave power had favored war and conquest, hoping that the newly acquired territory would furnish more slave States and more Senators in its interest. That hope was dashed when California presented herself for admission into the Union, with a State constitution excluding slavery from her soil. To the slave power this was a stunning blow. It had fought for more slave States and conquered for more free States. The admission of California would hopelessly destroy the balance of power between freedom and slavery in the Senate. The country soon was ablaze with excitement. In the North the antislavery feeling ran high. The "fire-eaters" of the South, exasperated beyond measure by their disappointment, vociferously threatened to disrupt the Union. Henry Clay, true to his record, hoped to avert the danger by a compromise. He sought to reconcile the South to the inevitable admission of California by certain concessions to slavery, among them the ill-famed and ill-fated Fugitive Slave Law; a law offensive not only to antislavery sentiment, but also to the common impulses of humanity and to the pride of manhood.

Webster had to choose. The antislavery men of New England, and even many of his conservative friends, hoped and expected that he would again, as he had done in Nullification times, proudly plant the Union flag in the face of a disunion threat, with a defiant refusal of concession to a rebellious spirit, and give voice to the moral sense of the North. But Webster chose otherwise. On the 7th of March 1850, he spoke in the Senate. The whole country listened with bated breath. While denouncing secession and pleading for the Union in glowing periods, he spoke of slavery in regretful but almost apologetic accents, upbraided the abolitionists as mischievous marplots, earnestly advocated the compromise, and commended that feature of it which was most odious to Northern sentiment,—the Fugitive Slave Law. From this "Seventh of March Speech"—by that name it has passed into history—Webster never recovered. It stood in too striking a contrast to the "Reply to Hayne." There was indeed still the same lucid comprehensiveness of statement. The heavy battalions of argument marched with the same massive tread. But there was lacking that which had been the great inspiration of the "Reply to Hayne,"—the triumphant consciousness of being right. The effect of the speech corresponded to its character. Southern men welcomed it as a sign of Northern submissiveness, but it did not go far enough to satisfy them. The impression it made upon the antislavery people of the North was painful in the extreme. They saw in it "the fall of an archangel." Many of them denounced it as the treacherous bid of a Presidential candidate for Southern favor. Their reproaches varied from the indignant murmur to the shrillest note of execration. Even many of his staunchest adherents among the conservative Whigs stood at first stunned and perplexed, needing some time to gather themselves up for his defense. This was not surprising. Henry

Clay would plan and advocate the compromise of 1850 without loss of character. Although a man of antislavery instincts, he was himself a slaveholder representing a slaveholding community, a compromiser in his very being; and compromise had always been the vital feature of his statesmanship. But Webster could not apologize for slavery, and in its behalf approve compromise and concession in the face of disunion threats, without turning his back upon the most illustrious feat of his public life. Injustice may have been done to him by the assailants of his motives, but it can hardly be denied that the evidence of circumstances stood glaringly against him. He himself was ill at ease. The virulent epithets and sneers with which he thenceforth aspersed antislavery principles and antislavery men—contrasting strangely with the stately decorum he had always cultivated in his public utterances—betrayed the bitterness of a troubled soul.

The 7th of March speech, and the series of addresses with which he sought to set right and fortify the position he had taken, helped greatly in inducing both political parties to accept the compromise of 1850, and also in checking, at least for the time being, the antislavery movement in the Northern States. But they could not kill that movement, nor could they prevent the coming of the final crisis. They did, however, render him acceptable to the slave power, when, after the death of General Taylor, President Fillmore made him secretary of state. In 1852 his hope to attain the Whig nomination for the Presidency rose to the highest pitch, although his prospects were darker than ever. But he had reached the age of seventy; this was his last chance, and he clung to it with desperate eagerness. He firmly counted upon receiving in the convention a large number of Southern votes; he received not one. His defeat could hardly have been more overwhelming. The nomination fell to General Scott. In the agony of his disappointment, Webster advised his friends to vote for the Democratic candidate, Franklin Pierce. In 1848 he had declared General Taylor's nomination to be one "not fit to be made"; but after all he had supported it. Then he still saw a possibility for himself ahead. In 1852, the last hope having vanished, he punished his party for having refused him what he thought his due, by openly declaring for the opposition. The reasons he gave for this extreme step were neither tenable, nor even plausible. It was a wail of utter despair. His health had for some time been failing, and the shock which his defeat gave him aggravated his ailment. On the morning of 24 Oct. 1852 he died.

Over Webster's grave there was much heated dispute as to the place he would occupy in the history of his country. Many of those who had idolized him during his life extolled him still more after his death, as the demigod whose greatness put all his motives and acts above criticism, and whose genius excused all human frailties. Others, still feeling the smart of the disappointment which that fatal 7th of March had given them, would see in him nothing but rare gifts and great opportunities prostituted by vulgar appetites and a selfish ambition. The present generation, remote from the struggles and passions of those days, will be more impartial in its judgment. Looking back upon the

time in which he lived, it beholds his statuesque form towering with strange grandeur among his contemporaries,—huge in his strength, and huge also in his weaknesses and faults; not indeed an originator of policies or measures, but a marvelous expounder of principles, laws, and facts, who illumined every topic of public concern he touched, with the light of a sovereign intelligence and vast knowledge; who, by overpowering argument, riveted around the Union unbreakable bonds of constitutional doctrine; who awakened to new life and animated with invincible vigor the national spirit; who left to his countrymen and to the world invaluable lessons of statesmanship, right, and patriotism, in language of grand simplicity and prodigiously forceful clearness; and who might stand as its greatest man in the political history of America, had he been a master character as he was a master mind.

Consult: Curtis, 'Life of Daniel Webster' (1870); Wilkinson, 'Webster: an Ode' (1882); Lodge, 'Daniel Webster' in 'American Statesman Series' (1883); McMaster, 'Daniel Webster' (1902); and the histories of Schouler, Rhodes, and Von Holst. Webster's private correspondence was published in 1857, and his speeches, etc., in six volumes.

CARL SCHURZ,
Author of 'Life of Henry Clay.'

Webster, Ebenezer, American patriot, father of Daniel Webster (q.v.): b. Kingston, N. H., 1739; d. Franklin, N. H., 1806. In his youth he served under Gen. Amherst in the "old French war," and in 1761 was one of the original settlers of that part of the town of Salisbury now known as Franklin. He united, as was common at the time, the occupations of farmer and innkeeper, took an active part in public matters, and at the outbreak of the Revolution led the Salisbury militia to Cambridge. Subsequently he fought at White Plains and Bennington, and served in other campaigns until the close of the war, when he had attained the rank of colonel of militia. He was at various times a member of both branches of the legislature, and in 1791 was appointed judge of the court of common pleas, which office he held till his death. In personal appearance he resembled his son Daniel, being of a large frame, with a swarthy complexion and dark piercing eyes.

Webster, Henry Kitchell, American author: b. Evanston, Ill., 7 Sept. 1875. He was graduated from Hamilton College, Clinton, N. Y., in 1897, and in the following year was instructor in rhetoric at Union College. With Samuel Merwin (q.v.), he has written: 'The Short Line War' (1899); and 'Calumet ("K")' (1901). His own work includes: 'The Banker and the Bear' (1900); 'Rogers Drake, Captain of Industry' (1903); etc.

Webster, Herbert Tracy, American eclectic physician and author: b. Portland Township, Chautauqua County, N. Y., 14 Oct. 1847. He was graduated at the Eclectic Medical Institute of Cincinnati in 1869, and in 1882 was appointed professor of materia medica in the California Medical College (now located at San Francisco), and now fills the chair of principles and practice of medicine in the same institution. He has written 'Principles of Medicine'; 'Dynamical Therapeutics,' and 'The New Eclectic Practice of Medicine.'

WEBSTER

Webster, John, English dramatist: b. about 1580; d. about 1625. He appears to have followed the occupation of his father, a tailor, and in 1604 was a freeman of the Merchant Taylors' Company. In 1602 he began to write plays in collaboration with other playwrights, but attained to his full power only when, between 1607 and 1612, he adopted independent authorship. He added to 'The Malcontent,' a play by John Marston, and was associated with Dekker in writing the two vigorous prose comedies, 'Westward Hoe' (acted 1604), and 'Northward Hoe' (acted 1605). 'The White Devil,' or 'Vittoria Corombona,' a tragedy published in 1612, was his first independent work, and is now recognized as one of the best tragedies of its age. 'Appius and Virginia,' published in 1654, followed soon afterward, and in 1616 his masterpiece, 'The Duchess of Malfi,' was first produced at the Blackfriars Theatre. It was first published in 1623. This great tragedy, which has won enthusiastic praise from Charles Lamb and many subsequent critics of eminence, is based on a Neapolitan story found in Bandello. 'The Devil's Law Case' was published in 1623, and appears to have been Webster's last play. Of other plays sometimes ascribed in part to Webster, only 'A Cure for a Cuckold' (published 1661) seems to contain any of his work. Webster wrote in 1624 a pageant for the Lord Mayor of London, and in 1612 was associated with Heywood and Tournour in producing 'Three Flegies to the Memory of Prince Henry.' He also contributed verses to other works. There are editions of Webster's works by Dyce (1830; new eds. 1857 and 1886) and Hazlitt (1856). J. A. Symonds edited a selection in the 'Mermaid Series' in 1888, and there is an edition of 'The Duchess of Malfi' in the 'Temple Dramatists' by C. E. Vaughan (1896). Consult: Hazlitt, 'Dramatic Literature of the Age of Elizabeth' (ed. 1840); Vopel, 'John Webster: Researches on his Life and Plays' (1887); Gosse, '17th Century Studies' (1883); Swinburne, 'Studies in Prose and Poetry' (1894). Lamb was the earliest among 19th century critics to give due praise to Webster, and Swinburne enthusiastically places him next to Shakespeare among English dramatists.

Webster, (Julia) Augusta Davies, English poet and dramatist: b. Poole, Dorsetshire, 30 Jan. 1837; d. Kew, Surrey, 5 Sept. 1894. She was a daughter of Admiral George Davies, and was married to Thomas Webster, a fellow of Trinity College, in 1863. In 1879 she was elected to the London School Board. Her first work was published under a pseudonym, which she soon discarded, and her early inclinations led her to make translations from the Greek in which field she did admirable work. As a dramatic poet she takes high rank, but her verse appeals most nearly to highly cultured readers. Her works include: 'Dramatic Studies' (1866); 'Portraits' (1870); the dramas 'Disguises' (1879); 'In a Day' (1882) and 'The Sentence' (1887); 'The Medea of Euripides,' translation (1868); 'A Housewife's Opinions' (1878); 'Daffodil and the Croaxaxicans' (1884); etc.

Webster, Noah, American lexicographer: b. Hartford, Conn., 16 Oct. 1758; d. New Haven, Conn., 28 May 1843. In 1774 he entered Yale College, but his studies were interrupted by the outbreak of the Revolutionary War, in which

he served under his father as a volunteer. He was graduated in 1778, and was admitted to practise law in 1781, but the unsettled state of the country prevented his obtaining a suitable opening in his profession, and in 1782 he removed to Goshen, N. Y., where he taught a classical school. Soon after he published his 'Grammatical Institute of the English Language,' in three parts, Part 1 (1783) containing 'A New and Accurate Standard of Pronunciation'; Part 2 (1784), 'A Plain and Comprehensive Grammar'; Part 3 (1785) 'An American Selection of Lessons in Reading and Speaking.' The first part of this work afterward became popularly known as 'Webster's Spelling-book.' In 1889 it was stated that 62,000,000 copies of the work had then been published. His literary activity was henceforth very great, and among works issued by him during the next few years are 'Sketches of American Policy' (1784-5), an argument for the formation of a national constitution. In 1787, after the adjournment of the Constitutional convention, he published the pamphlet, 'Examination of the Leading Principles of the Federal Constitution'; and 'Dissertations on the English Language' (1789). He began the practice of law at Hartford in 1789, but removed in 1793 to New York, where he established a daily paper, the *Minerva* (later *The Commercial Advertiser*), for the purpose of supporting the government. He published in 1794 a pamphlet on the 'Revolution in France,' and wrote ten essays under the signature of "Curtius," in favor of the Jay treaty with Great Britain. These publications had a powerful influence in stemming the tide of feeling in favor of a French alliance. In connection with the visitation of yellow fever he made a special study of the history of pestilential diseases, and wrote a work on contagious diseases which was published in England and America in 1799. In the previous year he had removed to New Haven. In 1802 he published 'Historical Notices of the Origin and State of Banking Institutions and Insurance Offices.' His great work was the 'American Dictionary of the English Language.' He devoted many years to the collection of new words and preparation of more free and exact definitions. In 1824, when the book was nearly finished, he visited Europe to procure such information as he had been unable to obtain in America. After a short stay in Paris he went to England, where he finished his dictionary during an eight months' residence in Cambridge. In June 1825, he returned to America. An edition of 2,500 copies of his dictionary was published in 1828, followed by an edition of 3,000 in England under the superintendence of E. H. Barker. The work contained 12,000 words and 40,000 definitions not to be found in any similar publication. In 1840-1 he published a second edition in two volumes, with extensive additions to the vocabulary and corrections of definitions. His 'Collection of Papers on Political, Literary and Moral Subjects' was a reprint of some of his earlier writings. Webster was throughout life associated with many of the most eminent men of the country, and always took an active share in public life, supporting his party chiefly by his pen. Several enlarged and improved editions of his dictionary have been published since his death both in America and in England, and it has always held its place as a standard work.

WEBSTER — WEDDERBURN

Among his further writings are: 'Letters to Dr. Priestly' (1800); 'Origin, History and the Connection of the Languages of Western Asia and of Europe' (1807); and a 'History of the United States' (rev. ed. 1838). Consult the 'Life' by Scudder (1882) in the 'American Men of Letters' series.

Webster, Sir Richard Everard, 1st Baron Alverstone, English jurist: b. 22 Dec. 1842. He was educated at Cambridge, was called to the bar in 1868, became queen's counsel in 1878 and was attorney-general in Lord Salisbury's cabinet in 1885-6, 1886-92, and 1895-1900. He was returned to Parliament for Launceston in 1885, and in 1885-1900 was member for the Isle of Wight. He was knighted in 1885, created a baronet in 1900 and in that year was raised to the peerage. In 1893 he was one of the British representatives before the Bering Sea Arbitration Tribunal. He was Master of the Rolls, May-October 1900, and was then appointed chief justice. He served as a member of the Alaskan Boundary Tribunal in 1903.

Webster, Mass., town in Worcester County; on the French River, and on the New York, N. H. & H., and the Boston & A. R.R.'s; 15 miles south of Worcester. It is in an agricultural region and has considerable industrial interests connected with farm products. A lake (1,225 acres) is one of the attractions of the town. It has cotton and woolen mills, shoe factory, and machine shops. It has a good water system. There are 11 churches, a high school, 13 graded public schools, three graded parish schools, and a public library. There is one national and one savings bank. The savings bank has (1903) deposits amounting to \$1,632,900. The government is administered by annual town meetings. Webster was set off from Dudley and Oxford and in 1832 was incorporated. Pop. (1890) 7,031; (1900) 8,804.

Webster-Ashburton Treaty, The, in American history, a treaty between the United States and Great Britain, negotiated by Daniel Webster and Lord Alexander Baring Ashburton in August 1842. By this treaty the frontier line between the State of Maine and Canada was definitely agreed to. By this agreement seven twelfths of the disputed ground, and the British settlement of Madawaska, were given to the United States, and only five twelfths of the ground to Great Britain; but it secured a better military frontier to England, and included heights commanding the Saint Lawrence, which the award of the king of Holland, who had been chosen arbiter, had assigned to the Americans. By the 8th and 9th articles, provisions are made for putting an end to the African slave-trade; and the 10th article provides for the mutual extradition of suspected criminals. See TREATIES; UNITED STATES — ARBITRATION IN THE.

Webster City, Iowa, county-seat of Hamilton County; on the Boone River, and on the Webster City & S., the Chicago & N., and the Illinois C. R.R.'s; about 70 miles north of Des Moines. It is in an agricultural region, in which there are a number of coal mines. It has a shoe factory, foundry, machine shops, iron furnaces, flour mill, grain elevators, and large coal yards. It has a high school, graded public and parish schools. The four banks have a com-

bined capital of \$275,000 and deposits (1903) amounting to \$1,210,000. Pop. (1880) 1,848; (1890) 2,829; (1900) 4,613.

Webworms, a name applied to various species of caterpillars or lepidopterous larvæ because of their habit of spinning webs of silk enclosing leaves upon which they feed and also serving as a shelter. As a rule neither the web-spinning nor the social habit is so highly developed as in the tent-caterpillars (q.v.), but there is no sharp distinction in the application of the two names. The species of caterpillars exhibiting such habits are quite numerous and belong to a number of genera and families of moths (q.v.). Some of them are of considerable economic importance. The fall webworm is the larva of the small white moth (*Ilyphantria cunea*). As soon as they leave the egg all of the larvæ hatching from a mass spin a common web enclosing several leaves. After these are eaten the caterpillars wander farther and farther in search of food, sometimes destroying the entire foliage of a tree, but always return to the shelter of the nest to rest when not feeding. The web may be extended to include whole branches. The caterpillars are covered with long hairs, and there are two broods, one in the spring and one in the fall, the latter being unusual among species of similar habit, wherefore the name. All kinds of shade and ornamental trees suffer from their attacks. As typical of a large and quite distinct group of caterpillars is the garden webworm (*Loxostege similalis*). This is a small, nearly naked caterpillar, which feeds in company on all kinds of garden vegetables, the leaves of which are drawn together in small webs. Some of the related species form large colonies and one small form is often very destructive to dried clover hay. The root webworms are the caterpillars of the little roll-wing moths. *Crambus vulvaregellus* is a common species which spins a web about the stalks and roots of grass to which, as well as to corn, it is sometimes very destructive. The true tent-caterpillars (q.v.) belong to the genus *Clisiocampa* and family *Bombycidae* or silk-spinning moths. A quite unrelated species is *Cacaria cerasiorana*, which forms veritable silken tents, sometimes covering small trees entirely. The general method of combating webworms is to destroy their eggs in winter, to burn the newly-formed tents, and to spray the foliage about the tents with arsenical solutions. The ground-webs may be checked by fall plowing.

Consult: Harris and Flint, 'Insects Injurious to Vegetation' (New York 1884); and publications of the U. S. Department of Agriculture.

Wedderburn, wēd'er-bērn, Alexander, BARON LOUGHBOROUGH and 1st EARL OF ROSSLYN, British politician: b. Edinburgh 13 Feb. 1733; d. near Windsor, England, 2 Jan. 1803. He was educated at the University of Edinburgh, was called to the English bar in 1757, entered Parliament in 1761 as member for Ayr, and subsequently represented various constituencies. He pleaded the great Douglas case in 1768-89, and in 1771 left the ranks of the opposition to become a firm supporter of Lord North, who had appointed him solicitor-general. He strenuously opposed the claims of the American colonists, defending the policy of Lord North throughout

WEDDERBURN — WEDGWOOD WARE

the American war. He was made chief justice of the court of common pleas in 1780, at the same time being raised to the peerage as Baron Loughborough, and in 1783 assisted in forming the coalition ministry, but in 1784 he joined the forces of Fox. He subsequently made friends with Pitt and gained from him the place of lord chancellor, after which he joined the supporters of George III. Upon his retirement from the chancellorship in 1801 he was created Earl of Rosslyn.

Wedderburn, James, Scottish psalmist: b. Dundee, Scotland, about 1500; d. England, about 1564. He studied at the University of Saint Andrew, became interested in the Scottish Reformation, and fled to France to escape prosecution as a heretic. He edited, with his brothers Robert and John, the principal song book used in Scotland, 'Ane Compendius Buike of Godly and Spirituall Sangs, Collectit Out of Sundrie Partes of the Scripture, wyth Sundrie of Uther Ballates Changed Out of Prophane Sangs, for Avoyding of Sinne and Harlotrie' (about 1548). Later editions of this work have been edited by David Laing (1868) and Mitchell (1897). He is also credited with the authorship of 'The Complaynt of Scotland' (1548), "the only classic work in old Scottish prose." Consult Mitchell, 'The Wedderburns and Their Work' (1898).

Wedding Anniversaries, or celebrations held as follows: The Cotton wedding, 1 year; the Paper wedding, 2 years; the Leather wedding, 3 years; the Wooden wedding, 5 years; the Woolen wedding, 7 years; the Tin wedding, 10 years; the Silk and Fine Linen wedding, 12 years; the Crystal (Glass) wedding, 15 years; the China wedding, 20 years; the Silver wedding, 25 years; the Golden wedding, 50 years; the Diamond wedding, 75 years.

Wedding Ceremonies. See MARRIAGE.

Wedge, a piece of wood or metal, thick at one end and sloping to a thin edge at the other, used in splitting wood, rocks, etc. The wedge is one of the mechanical powers, and besides being used for splitting purposes, is used for producing great pressure, as in the oil-press, and for raising immense weights, as when a ship is raised by wedges driven under the keel. If the power applied to the top were of the nature of a continued pressure, the wedge might be regarded as a double inclined plane, and the power would be to the resistance to be overcome as the breadth of the back to the length of the side, on the supposition that the resistance acts perpendicularly to the side. But since the power is usually that of percussion with a hammer, every stroke of which causes a tremor in the wedge, which throws off for the instant the resistance on its sides, no certain theory can be laid down regarding it. To calculate the power we require the additional elements of weight of the hammer, momentum of the blow, and the intervals between the blows, and further the amount of tremor in the wedge and its antagonism to the resistance on the sides. All that is known with certainty respecting the theory of the wedge is that its mechanical power is increased by diminishing the angle of penetration.

Wedgwood, wěj'wüd, Josiah, English potter: b. Burslem, Staffordshire, 12 July 1730; d. Etruria, Staffordshire, 3 Jan. 1795. He was the

son of a potter in the district and on the death of his father was employed in the pottery at nine. An incurable lameness later compelled him to give up the wheel and he removed for a time to Stoke, where he entered into partnership with other potters and where his talent for ornamental pottery was first displayed. In 1759 he returned to Burslem, and set up a small manufactory of his own, in which he made white stoneware, and the cream-colored ware for which he became so famous. He presently succeeded in producing a ware so hard and durable as to render works of art produced in it almost indestructible, and also in executing paintings on pottery without the artificial gloss so detrimental to the effect of superior work. In 1771 he erected potteries at Etruria, a village which he founded for his workmen. His improvements in pottery, which included form, substance, and decoration, in all of which he attained an excellence rarely equaled, created the great trade of the Staffordshire potteries, which even during his lifetime acquired a remarkable expansion. He made 50 copies of the Portland vase, which were sold for 50 guineas each, a sum which it is said did not cover his expenditure in their production. (See POTTERY; WEDGWOOD WARE.) Consult: Jewett, 'The Wedgwoods' (1865); Eliza Meteyard, 'Life' (1860); Rathbone, 'The Masterpieces of Old Wedgwood Ware' (1892-3); 'Life,' by Smiles (1894).

Wedgwood Pyrometer, in physics, a pyrometer in which temperature is ascertained by the contraction of baked clay, measured before and after its subjection to the action of heat.

Wedgwood Ware, a variety of English pottery first made by Josiah Wedgwood (q.v.), in which artistic designs and treatment were combined with mechanical and technical excellence. There were six distinguishing kinds of this ware, arranged in the order of their invention as follows: (1) Cream-colored ware, called Queen's ware, in various hues of cream color, saffron, and straw. (2) Egyptian black, or basaltes ware, used for seals, plaques, life-size busts, medallion portraits, etc. (3) Red ware, or Russo antico. (4) White semi-porcelain, or fine stoneware, differing from the white jasper in its pale straw-colored or grayish hue, and in its waxlike smooth surface and subtranslucency. (5) Variegated ware, of two kinds, one a cream-colored body, marbled, mottled, or spangled with divers colors upon the surface and under the glaze; the other an improved kind of agate ware, in which the colored clays in bands, twists, stripes, and waves constituted the entire substance. (6) Jasper ware, in which the chief triumphs of Wedgwood were wrought, resembling outwardly the finest of his white terra-cotta and semi-porcelain bodies. One of his earliest recipes for this last-named ware was, in percentage, barytes, 57.1; clay, 28.6; flint, 9.5; barium carbonate, 4.8; the novelty of these components being the use of the barytes and barium carbonate. A very little cobalt was occasionally added, even to the white jasper ware, to neutralize the yellowish hue, and by introducing a little Cornish stone or other felspathic material it became less opaque and more wax-like.

There are seven colors in Wedgwood ware besides the white — blue of various shades, lilac,

pink, sage-green, olive-green, yellow, and black — and it is remarkable for the absence of bubbles and holes, the flatness of the field, and the uniformity of grain. It was produced in numberless forms — cameos, intaglios, portrait medallions, statuettes, vases, etc., and the yellow variety is rare. Wedgwood's artistic work consists not only in copies of antique gems and in the adaptation of antique designs, but in the original productions of many English and foreign draughtsmen and modelers.

Wed'more, Frederick, English author: b. Richmond Hill, Clifton, England, 9 July 1844. He was educated in France, has been art critic on the London 'Standard' since 1878, and has published an edition of Michel's 'Rembrandt'; 'Poems of the Love and Pride of England' with his daughter Millicent. Among works of his own are: 'Pastorals of France' (1877); 'Life of Balzac' (1890); 'Studies in English Art' (1876; 1880); 'On Books and Art' (1899); 'The Collapse of the Penitents,' a novel; 'Turner and Ruskin' (1900); etc.

Wednesbury, wēnz'bū-rī, England, a manufacturing town in Staffordshire, 19 miles south-southeast of Stafford. The Gothic parish church stands on the summit of a hill at the northern extremity of the town; there are several other churches and chapels, a town hall, free library, a mechanics' institute, public baths, a benevolent society, an alms-house, and several schools. The principal manufactures are railway carriages, patent axles, and general ironwork for railways; steel tubing for gas and water, and steam pipes; gun locks and barrels, springs for coaches, hinges, nails, screws, spades, shovels, edge tools, and wrought iron work of every description. Pop. (1901) 26,544.

Wednesday, the fourth day of the week. The Germans call it *Mittwoch* (mid-week). The English name is derived from the old Scandinavian deity Odin or Woden. In Anglo-Saxon it is *Wodnesdag*; in Swedish, *Odensdag*; in Dutch, *Woensdag*. See also **ASH-WEDNESDAY**.

Weed, Clarence Moores, American zoologist: b. Toledo, Ohio, 1864. He was graduated from the Michigan Agricultural College in 1883 and is at present (1904) professor of zoology at New Hampshire College. He has written: 'Insects and Insecticides' (1893); 'Ten New England Blossoms and Their Insect Visitors' (1895); 'Seed Travelers' (1898); 'Insect World' (1899); 'The Flower Beautiful' (1903); 'The Nature Calendar Series' (1902-3); etc.

Weed, Edwin Gardner, American Protestant Episcopal bishop: b. Savannah, Ga., 23 July 1837. He was educated at the University of Georgia and studied theology at the General Theological Seminary whence he was graduated in 1870. He took priest's orders in the Episcopal Church in 1871 and was rector of the Church of the Good Shepherd, Summerville, Ga., 1871-86. In the year last named he was consecrated bishop of Florida.

Weed, Stephen Hinsdale, American soldier: b. New York 1834; d. near Gettysburg, Pa., 2 July 1863. He was graduated from West Point in 1854, served on the Texan frontier and in the Florida wars of 1855-7, receiving rank as lieutenant in 1856, and in 1858-61 he was on

duty in Kansas and Utah. In 1861 he was promoted captain and assigned to the command of a battery in the Army of the Potomac. He was engaged in the Maryland, Peninsular and Northern Virginia campaigns, and fought at Manassas, Antietam, and Chancellorsville, receiving promotion to brigadier-general of volunteers for gallantry at the latter. He commanded a brigade of artillery at Gettysburg 2 July 1862, and was killed while holding Little Round Top against the terrific onslaught of the Confederates. The place where he fell is now called "Weed's Hill."

Weed, Thurlow, American journalist and political leader: b. Cairo, Greene County, N. Y., 15 Nov. 1797; d. New York 22 Nov. 1882. He entered a printing office at 14, but left his trade for a time to serve in the army during the War of 1812; in 1815-19 he worked as a printer in New York; and in 1819 went to central New York State, where he established and edited successively 'The Agriculturist' at Norwich, and the 'Onondaga County Republican' at Manlius. In 1822 he became editor of the Rochester *Telegraph*, a daily paper, and later its proprietor. During the Anti-Masonic excitement he stopped the publication of the *Telegraph*, and issued the *Anti-Masonic Enquirer*. He was twice elected to the State Legislature on the Anti-Masonic ticket, and while in Albany became noted as a shrewd political manager. In 1830 he moved to Albany and established the *Albany Evening Journal*, which he edited till 1865. This paper was first used as a means of attacking the Albany "Regency," a body of politicians under the leadership of Martin Van Buren, and it soon became the leading journal of the Whig party in the State. Through the influence of this paper and his political skill, Weed became the dominant State manager of the Whig, and later of the Republican, party. He held no public office himself, but for many years practically controlled the nominations for State officers; his control being used as a rule for the public good; some of the most efficient governors of the State were elected under his management. He also took a leading part in national politics as early as 1824, and when J. Q. Adams was nominated for the presidency was instrumental in uniting the Clay and Adams factions; was particularly influential in securing the nomination of Harrison in 1840, Clay in 1844, and Taylor in 1848; and materially aided in the nomination of Scott in 1852 and Fremont in 1856. In 1860 his first choice for the presidency was Seward, but he loyally supported Lincoln after his nomination, and urged his renomination in 1864. Weed had long been a personal friend of Seward, and was for some time closely associated with Seward and Greeley in what was known as "the political firm of Seward, Weed and Greeley." In 1861 he went to Europe on a diplomatic mission to place the North in a favorable light before foreign governments, and to prevent their intervention in behalf of the South. After 1865 he was for a time a member of the editorial staff of the *New York Times*; in 1867-8 was editor of the *Commercial Advertiser* in New York. His health then forced him to resign continuous journalistic work, but he continued to write occasionally for newspapers and periodicals. and though he took no active part in politics, his advice was sought by Republican leaders, and

WEED — WEEK

had no small influence in shaping the policy of the party. He published 'Letters from Europe and the West Indies' (1866); and prepared his 'Autobiography,' which was published after his death (1884). Consult: Barnes, 'M memoir of Thurlow Weed' (1884).

Weed, Walter Harvey, American geologist: b. Saint Louis, Mo., 1 May 1862. He was graduated from the Columbia School of Mines in 1883, and in that year was appointed to the United States Geological Survey. In 1883-9 he was engaged in Yellowstone Park, where his investigations proved that the colors in hot springs and deposits in geysers are due to algæ, and he also discovered Death Gulch in that park. He was occupied in a general geological exploration of Montana in 1889-98, and in 1899 published his theory of secondary enrichments of ore deposits. He was appointed commissioner and expert on copper at the Louisiana Purchase Exposition in 1904. His publications include: 'Glaciation of Yellowstone Park' (1893); 'Secondary Enrichment of Mineral Veins' (1899); etc.

Weeden, William Babcock, American manufacturer and economic and historical writer: b. Bristol, R. I., 1 Sept. 1834. He studied at Brown University, and then engaged in the manufacture of woolen goods in Providence. In 1861 he joined the Union army as 1st lieutenant of artillery; was promoted captain after the first battle of Bull Run; was present during the siege of Yorktown, and took part in the engagements at Hanover Court House, Mechanicsville, Gaines' Mill, and Malvern Hill. In August 1862 he resigned and resumed business in Providence. His publications include: 'Morality of Prohibitory Liquor Laws' (1875); 'Social Law of Labor' (1882); 'Economic and Social History of New England, 1620-1789' (1890).

Weeds are plants growing where they are not desired. There are no plants which are weeds, *per se*, since in nature each plant has its place, and since in cultivated areas any plant, useless or useful, may become a weed. Thus grass would be considered a weed in a bed of garlic, and *vice versa*. Many plants, however, are popularly dubbed weeds because they are troublesome in fields and gardens, but even among these are not a few which are cultivated; for instance, purslane, lamb's quarters, and sorrel. Far from being the useless and obnoxious things that they have long been reputed to be, weeds have performed a distinct service, which they still continue, in agriculture; they have compelled the husbandman to practise clean cultivation, upon which the success of his crops very largely depends.

Weeds often must be eradicated upon land that has become foul under neglect. Upon pastures and lawns that commence to fail the two principal ways of management are to make more grass grow or to plow the land and grow some other crop upon it for a year or more. The former is usually more feasible with lawns; the latter with meadows and pastures. Often a re-seeding to grass will be sufficient. The plantain, dandelion, and similar weeds troublesome in lawns may be cut out individually, but to keep them out the growth of grass must be encouraged by sowing extra seed and by fertilizing. In

land that has lain fallow the annual weeds may be destroyed by frequent cultivation; biennial and perennial weeds, by short rotations of crops, especially such as include intertillage crops, like potatoes, beans, and turnips. The one necessity to observe in combating perennial weeds is to prevent their forming leaves and thus elaborating food. In low grounds where sedges, rushes, and bracken often abound, the land may be rid of these weeds by draining. In gardens many weeds may be "smothered" by growing leafy crops which will shade the ground. Ground which is kept free from weeds in the early months may become choked with weeds toward autumn and these may re-seed the ground for the following year. Mowing before the plants blossom, or plowing the ground are often practised. In some cases, however, the plants may be allowed to remain as a cover crop to prevent the washing of the soil during winter. This practice is most common in orchards. A cover crop sown by the orchardist is preferable.

Beside the usual means of seed dispersal, such as wind and water, weeds are frequently distributed by means of baled hay, manure, and imperfectly cleaned seeds of the crops sown. This last is particularly prevalent with such difficultly cleaned seeds as grass and clover. Hence the advisability of purchasing only the best seeds. It is not remarkable that many of the most troublesome weeds are imported from foreign countries, because being removed from their natural controls they find less resistance and spread accordingly.

Weeds are often of service in aiding the farmer to judge the needs of his land, since many kinds grow only where the conditions are peculiarly adapted to them. The character of their growth also indicates the quality of the soil. Wild carrot and the ox-eye daisy grow only upon poor soils, or soils that have been robbed of their fertility. Sheep sorrel indicates acid land and the necessity of applying lime to "sweeten" the soil. Bracken, sedge, and moss show that the land needs drainage. Dark green foliage and large size of plant and leaf are good indications of abundant nitrogenous plant food in the soil; and yellowish foliage and sparse, stringy growth shows lack of this material.

Weehawken, wē-hā'kēn, N. J., town in Hudson County; on the Hudson River, and on the New York, Ontario & Western and the West Shore R.R.'s; opposite New York. It is one of the largest, if not the largest, coal depot in the United States. It has the coal docks and freight sheds of the Erie Railroad Company, and the coal docks of the Delaware and Hudson Canal Company and the Pennsylvania Company. It has several manufacturing establishments. Two of the Hackensack Water Company reservoirs are located here. Weehawken is known as the dueling place of Alexander Hamilton and Aaron Burr. Pop. (1890) 1,943; (1900) 5,325.

Week, a period of seven days, one of the common divisions of time. The week is not a natural division of time, and the question when, why, and by whom it was first adopted necessarily arises in connection with its actual prevalence. The only natural explanation offered is that it has been adopted as a quarter lunation; but as there is no absolute necessity for dividing the month into four, and a large fraction is

WEEKES—WEEMS

needed to make the weekly square with the lunar periods, this explanation is not satisfactory. The week is, in fact, a much closer division of a year than of a month; but the division of the year into 52 portions is so purely arbitrary that this can hardly suggest the origin of the week. The convenience of some short recurring period or cycle of days is obvious, and it is the prevalence alone, and not the occurrence of a particular cycle, that has to be accounted for. The practice of antiquity on the subject does not seem to have been so uniform as is sometimes supposed. Among the nations who adopted the week as a division of time, the Chinese, Hindus, Egyptians, Chaldeans, Jews, Persians, and Peruvians have been mentioned, but in some cases the antiquity of the practice is doubtful, and in others the name has been applied to other cycles than that of seven days. The nations with whom the weekly cycle has been traced with certainty to the greatest antiquity are the Egyptians and the Hebrews. With the former we only know of its existence, but with the latter it had a much more important character. Their earliest records speak of its existence, and refer it to a period previous to that of the nation itself. Laban, the uncle of Jacob, alludes to the week as an established measure of time in Gen. xxix. 27. The origin of the week is further ascribed in the Jewish Scriptures to the creation of the world, and is wrought into the institutions of the nation in a variety of ways, but particularly by the consecration of the seventh day to the worship of the Creator. The Hebrew word for week is of a general signification, and applies equally to a period of seven days, seven months, and seven years, each of which had a particular celebration attached to it in the Hebrew ritual, hence the use of days to represent years in the prophetic writings is according to the natural genius of the language. The number seven had a mystic significance attached to it in the symbolism of the Jewish religion in a variety of other ways. The Romans and Greeks each divided the month into three periods (see *CALENDAR*), and were not acquainted with the week till a late period. The Romans, however, had for civil uses, as the arrangement of market-days, a cycle of eight days, the ninth day being the recurring one, instead of the eighth, as with us. The use of the week was introduced into the Roman Empire about the first or second century of the Christian era from Egypt, and had been recognized independently of Christianity before the Emperor Constantine confirmed it by enjoining the observance of the Christian Sabbath. The names given by the Romans to the days of the week, and which have pervaded Europe, were derived from the planetary system, which was supposed to consist of the sun, moon, and five planets, Mars, Mercury, Jupiter, Venus, and Saturn. With the Mohammedans the week has also a religious character, Friday being observed by them as a Sabbath. It is supposed by some authorities that they introduced the week to India. The Chinese week is said to consist of five days, named after the five elements, iron, wood, water, feathers, and earth. See articles on the different days of the week.

Weekes, wēks, Henry, English sculptor: b. Canterbury 1807; d. 29 May 1877. He was for many years the principal assistant of the sculptor Chantrey, was elected to the Academy

in 1863 and became professor of sculpture there in 1873. Besides the earliest bust of Queen Victoria (1837) he executed statues of Latimer, Cranmer, Bacon, Charles II., and others.

Weeks, Edwin Lord, American artist: b. Boston 1849; d. Paris 17 Nov. 1903. He was a pupil of the Beaux-Arts (Paris), of Gérôme, and Bonnat, and sketched and painted in Cairo, Jerusalem, Damascus, Tangier, and other parts of the Orient, obtaining there material for the genre-scenes from Eastern life with which he won his reputation. A frequent exhibitor at the Salon, he obtained honorable mention there in 1885. Among the other distinctions which he received were the diploma of honor at the Berlin international exhibition in 1891, and a special medal and prize in 1896 at the Empire of India exhibition (London). Specimens of his work are in the Pennsylvania Academy of Fine Arts, Philadelphia, and the Corcoran Gallery of Washington. Among his paintings are: 'A Cup of Coffee in the Desert'; 'Jerusalem from the Bethany Road'; 'Pilgrimage to the Jordan'; 'Scene in Tangier'; 'Arab Story-Teller' (exhibited at the Centennial Exhibition, Philadelphia, 1876); 'Departure for the Hunt—India'; 'Moorish Camel-Driver.' He also wrote 'From the Black Sea Through Persia and India' (1895), and 'Episodes of Mountaineering' (1897).

Weeks, Feast of (Heb. *Shabuoth*), a name employed by the Jews for the second of the great Hebraic religious festivals. It is thus called from the fact that it forms the culmination of the seven weeks succeeding the Passover feast. Primarily it appears to have been connected with the celebration of the end of the harvest, but later also with the giving of the Law on the fiftieth day after the departure from Egypt. In the New Testament it is called Pentecost (q.v.), the Greek word (*πεντηκοστή*) signifying fiftieth (from *ἡμέρα*, day).

Weems, wēmz, Mason Locke, American Protestant Episcopal clergyman: b. Maryland about 1760; d. Beaufort, S. C., 23 May 1825. He began the study of medicine, but gave it up and went to London, where he was educated for the clerical profession, but found no bishop in England to admit him to holy orders. There was then no Anglican bishop in America and the professional plans of Weems were obstructed by peculiar difficulties. (For an account of them see McMaster's 'History of the People of the United States', Vol. I.) Returning to this country, he preached at different places, apparently never having a regular charge, although it has been said that the rectorship of Mount Vernon parish (there was no such parish) was held by him before the Revolution, as claimed by himself; also that he officiated in the old Pohick Church, of which Washington was an attendant, which indeed he may have done, but not until long after Washington's attendance there had ceased. About 1790 he became a book agent for Mathew Carey (q.v.), and traveled through the South selling works, some of which were his own. He made himself popular by exercising his talents for comedy and his skill with the violin, probably diverting and (through his sermons) exhorting the people by turns. A book of his own writing which he offered for sale was 'The Drunkard's Looking Glass, Reflect-

ing a Faithful Likeness of the Drunkard in Sunday Very Interesting Attitudes, with Lively Representations of the Many Strange Capers which he cuts in Different Stages of His Disease' (6th ed. 1818). His 'Life of Washington,' by which he is best known, first appeared in 1800, and during the 19th century the number of its editions exceeded 70. The traditional conception of Washington rests mainly upon this work, as do the story of the cherry-tree and other anecdotes which historians reject, most of which first appeared in the 5th edition (1806). His other publications, all more or less tawdry and inaccurate, include: 'Life of General Francis Marion' (1805); 'The Philanthropist, or Political Peacemaker Between All Honest Men of Both Parties' (10th ed. 1809); 'God's Revenge Against Gambling' (3d ed. 1816); 'Life of Benjamin Franklin with Essays' (1817); 'Life of William Penn' (1819); 'Hymen's Recruiting Sergeant, or the New Matrimonial Tattoo for Old Bachelors' (7th ed. 1821); and 'The Bad Wife's Looking Glass, or God's Revenge Against Cruelty to Husbands' (2d ed. 1823).

Weenix, Jan, yān vā'nīks, THE YOUNGER, Dutch painter, son of the following: b. Amsterdam 1644; d. there 20 Sept. 1719. He painted landscapes, animals, flowers, and fruit, but excelled in the representation of dead game and hunting scenes. His pictures of this class are unrivaled by any productions of the Dutch school, and command large prices. He finished with extreme neatness, and exhibited a clear and brilliant coloring and a wonderful knowledge of chiaroscuro. Many of his works are to be seen in England and he is well represented in the galleries of the Continent.

Weenix, Jan Baptist, Dutch painter: b. Amsterdam 1621; d. Ter May, near Utrecht, 1660. He was instructed by Abraham Bloemart and Nicolas Moijert, and at 22 visited Rome, where he acquired a reputation by his Italian seaports and landscapes with architectural accessories. The last 12 years of his life were passed in Holland. He was a rapid painter, having been known to finish three half-length portraits with accessories in a single day, and excelled in history, portrait, animal, landscape, and marine painting, being on the whole most distinguished in the last named department.

Weeping Cross, a cross of stone or wood, erected at the side of a road, at which penitents prayed and wept for their sins. Hence the old English saying, 'To return by weeping cross,' that is, to return in sorrow from some message or undertaking. As these crosses were removed in England when that country became Protestant, the saying is now obsolete, but is met with in old writers.

Weever (variant of weaver, or of the obs. *wiver*, from Lat. *vīpera*, viper), a fish of the genus *Trachinus*, two species of which are recognized: *T. vipera*, 5 to 6 inches in length, and *T. draco*, 10 to 12 inches. These fishes possess sharp opercular and dorsal spines, with which they can inflict a painful wound. The sting is believed not to be poisonous, but it is very similar to that of the sting-ray (q.v.). The name weever is hence applied to any of the *Trachinida* (q.v.).

Weevil, a general name applied not only to various genera of adult beetles but also to their larvæ. They form a group *Rhynchophora*, or snout-beetles, so called from the characteristic production of the head in the form of a prominent snout, bearing the elbowed antennæ at the sides and the small mouth at its tip. There are several families, but most of these beetles belong to the Curculionidæ, which is said to include upward of 600 genera and 20,000 species. All of them are vegetarians and the larvæ are little white or yellow, fat, footless grubs which mostly live within the tissues of plants, and are especially destructive to nuts, seeds, and fruits. One of the most conspicuous and harmful is the cotton-boll weevil (*Anthonomus grandis*.) It is about one fifth of an inch long, and has the first pair of legs thickened and provided with several large spines. Immediately after transforming the color is reddish, but by the time the beetles emerge from the bolls they are covered with a yellowish down which gradually becomes gray. The grub-like larvæ are considerably longer, strongly curved, thickened posteriorly, and white with pale red heads. The eggs are deposited on the young bolls and buds into which the larvæ bore and devour the interior of the seeds as well as the cotton fibres, thus ruining the latter for textile usage. When abundant many larvæ may infest each boll. The life-cycle is completed in about 80 days and there are two broods.

This insect, which has already worked havoc in the cotton fields of Texas, is an importation from tropical Mexico, whence it was introduced into the United States in the neighborhood of Brownsville about 1892. By 1895 it became established as a serious pest and has continued to spread northward and eastward until by 1904 a very large part of the cotton district of Texas had been invaded. Efforts to stay its progress have so far been unavailing, but it is hoped that strict quarantine measures will prevent its extension beyond the borders of that State until better methods of fighting it have been perfected. The methods at present recommended are early planting, dusting with Paris green, hand-picking of the beetles when they appear, and of the squares upon which eggs have been deposited, and total destruction of the plants in the early fall, either by burning or feeding to cattle to prevent the hibernation of the beetles. There is also some hope of the development of a weevil-proof variety of cotton plant.

The grain-weevil (*Sitophilus granarius*) is a little beetle of a dark red color, and about 1/8 inch long. The eggs are deposited on wheat after it is stored, and the larvæ burrow therein, each larva inhabiting a single grain. It is immensely destructive. The rice-weevil (*S. oryzae*) destroys rice and Indian-corn in a like fashion. This latter species has four red spots on the elytra or wing-covers. Another species (*Calandra palmarum*) infests palm-trees. It is common in Guiana, and attains a length of two inches, the larvæ burrowing in the pith of the trees. *C. sacchari* inhabits sugar-canes, and is destructive in the West Indies. The negroes consider the larvæ of these latter as delicacies, and eat them boiled. The genus *Rhynchites*, of which the grape-weevil (*R. bacchus*) is an example, has the head broad behind. This spe-

cies devastates the growing vines, and strips them of their leaves. The plum curculio (*Conotrachelus nenuphor*) causes great damage to plums, cherries, and other stone fruits. The eggs are laid one at a place in the young, forming fruit, upon the flesh of which the larva feeds, causing it to drop prematurely or to become "wormy." The beetle is less than one fifth of an inch long and dark brown spotted with black and yellow. The familiar chestnut-worm is the larva of *Balaninus rectus*, remarkable for the great length of the snout, which exceeds the short robust body and which is adapted for piercing the thick burrs of the young chestnuts, permitting the deposition of an egg in the kernel. Related species of the genus infest other nuts. Equally troublesome to fruit-growers are the species of *Anthonomus*, of which one pretty little species (*A. signatus*) causes great damage to the Sharpless and other staminate varieties of strawberry. This species attacks the flowers, and the larvæ feed upon the pollen. Still quite different in its habits is the potato weevil or potato-stalk borer (*Trichobaris trinitata*), the larva of which bores passages in the stems of potatoes and wild plants of the same family. The clover-weevil (*Phytonomus punctatus*) has green larvæ which differ from all of the foregoing in living exposed to the air and light, though they feed chiefly at night. They eat the leaves and as they hibernate in the ground and begin to feed almost as soon as the clover sprouts in the spring they become most serious pests. The imagoes are nearly $\frac{1}{3}$ inch long, thick-bodied and short-snouted, with strongly knobbed antennæ.

To the family *Bruchidæ* belong the extremely destructive pea and bean weevils, which have the proboscis short and curved down on the breast and the antennæ not elbowed. They are small beetles with stout bodies and the swollen abdomen often projecting beyond the tips of the wing-covers. Unlike the Curculionidæ, which become quiescent and assume an appearance of death, these beetles are extremely active and fly when disturbed. The larva of the pea-weevil (*Bruchus pisi*) damages peas, the eggs being laid when the peas are ripening. They destroy much of the substance of the grain, lessen its germinating power and pupate in its interior. The mature insect is of a black color, marked with white spots, and about $\frac{1}{8}$ inch long. The *B. pisi* was at one time so destructive in North America that its ravages threatened to wholly exterminate the pea crops. Several species are named corn-weevils, from their destructive effects in granaries. *B. granarius* also attacks peas, and one species infests the cocoonut. The bean-weevil (*B. fabæ*) is plain brown in color but otherwise similar.

Weevils are very difficult to control on account of their small size, inconspicuousness, and the fact that the destructive larvæ are generally beyond the effective reach of insecticides. The best measures consist in the total destruction by burning of all infested fruits, nuts, or stems, the digging or plowing in the late fall of the ground in which the pupæ hibernate, and in the case of the pea and bean weevils the fumigation with carbon bisulphide of all infested seed.

Consult: Harris and Flint, 'Insects Injurious to Vegetation' (New York 1884); Saunders, 'Insects Injurious to Fruits' (Philadel-

phia 1883); Smith, 'Economic Entomology' (Philadelphia 1896).

Weeyot. See WISHOSKAN.

Wei-Hai-Wei, wā'hi'wā', China, a seaport and British naval and coaling station, in the province of Shantung, near the eastern extremity of the Shantung peninsula, 40 miles east of Chee-foo. It lies on the south shore of the entrance to the Gulf of Pe-chi-li, opposite Port Arthur on the north shore, about 100 miles distant. During the Chino-Japanese war, the Japanese destroyed a Chinese fleet here and captured the town, which they evacuated early in 1898. By a convention of 1 July 1898 the port of Wei-hai-wei, together with the adjacent waters and some neighboring territory, was leased to Great Britain for so long a period as Russia shall hold Port Arthur (q.v.). The leased territory includes the island of Liu Kung, all the islands in the bay, and a belt of land 10 miles wide along the whole coast of the bay; area, 280 square miles; pop. 120,000. By the terms of the lease Great Britain has sole jurisdiction within the limits of this territory, but within the walls of the city Chinese officials may exercise such authority as is not inconsistent with the defense of the territory. The British government may also erect fortifications and carry out other defensive works in a defined region lying outside of the leased territory. Chinese war-vessels retain the right to use the waters. Wei-hai-wei is not to be fortified, but is intended to be a naval base, place of exercise, and sanatorium for the British squadron on the China station.

Weidner, wīd'nēr, **Revere Franklin**, American Lutheran theologian: b. Centre Valley, Pa., 22 Nov. 1851. He was graduated from Muhlenberg College, Allentown, Pa., in 1869, from the Lutheran Theological Seminary, Philadelphia, in 1873, and after being ordained to the ministry was pastor at Phillipsburg, N. J., 1873-8, and at Philadelphia 1878-82. He was professor of English, history, and logic at Muhlenberg in 1875-7, and in 1882-91 was professor of dogmatics and exegesis at Augustana Theological Seminary, Rock Island, Ill. In the last named year he accepted the presidency and the chair of dogmatic theology at the Chicago Lutheran Theological Seminary, both of which posts he still (1904) holds. He has published: 'Commentary on the Gospel of Mark' (1881); 'Biblical Theology of the Old Testament' (1886); 'Annotations on the General Epistles' (1897); 'Theologia; or the Doctrine of God' (1903); 'Studies in Exodus' (1903); etc.

Weigand, vī'gānt, **August**, Belgian musician: b. Belgium; d. Oswego, N. Y., 26 May 1904. He began his musical career as organist of Saint Giles' Church, Liège, and subsequently long presided at the organ of the Sydney, N. S. W., Town-Hall—the largest instrument in the world. His achievements as organist and composer won for him a professorship in the Royal Conservatoire at Liège. He came to the United States in 1903, gave numerous concerts, opened the large organ at Brown University, and was appointed to open the grand organ at the Louisiana Purchase Exposition, Saint Louis, in June 1904. In a dozen years he gave throughout Europe more than 1,800 concerts. He was the recipient of various distinctions, and was generally known as Chevalier Weigand.

WEIGHING MACHINES

Weighing Machines, mechanical devices for ascertaining the weight or mass of objects. It is to be understood, however, that the element thus determined is a relative value, and is entirely independent of the magnitude of the force of gravity or the tendency of a body to fall. For example, the force of gravity decreases with elevation, but a commercial unit of weight such as a "pound" is the same at the foot as it is at the top of a mountain. In the usual method of determining weights of this character, a "unit of mass" is first adopted, and then a "set of weights" procured, each of which represents a certain predetermined number of the mass units. With these, by the aid of a machine so constructed as to be capable of establishing an equilibrium between any number of the weights and the article being weighed, the ratio of the weight of the article to that of the adopted unit of mass is determined, and this ratio identified with the ratio of the masses. Such machines may be conveniently arranged in three general classes—"equal armed" balances, "unequal armed" balances, and "spring" balances.

Equal armed balances are represented by the various forms of "scale-beams," in which the scale-pans are below the beams, and the "counter-machines" in which the scale-pans are above the beam, both forms operating by establishing an equilibrium between a known and an unknown weight. Unequal armed balances are represented by those consisting of a single steelyard, and those formed by combinations of unequal armed levers and steelyards, such as platform scales and weighbridges, in which a small known weight at one end of a multiplying beam counterbalances a heavy unknown weight at the other end. Spring balances operate on the principle that, when an elastic body is subjected to a tension, the amount of elongation increases with the increase in the force of tension. In the simplest form, it consists of a spiral spring of hard steel of a high elastic limit. As commonly used it is suspended from a fixed point by a hook at its upper end, while its lower end is bent into a hook, which is crossed by another hook to which the article to be weighed is attached. An index attached to the spring and moving along the face of a graduated plate, indicates the amount of tension in terms of the adopted unit of weight. The contrivance is so arranged that the axis of the spiral is always a plumb line, under tension or at rest, and is capable of weighing only an amount within the elastic limit of the spring. Their capacity is generally small, and they are extensively used in butcher shops, and for other purposes where a high degree of accuracy such as may be obtained by lever balances is not required. On the other hand, the various forms of dynamometers employed for registering the pull of locomotives, are made with enormous capacities. In this connection the "torsion balance" may be conveniently mentioned, although in reality it is a machine generally used for the purpose of measuring horizontal forces, rather than weights as here understood. In its simplest form it consists of a beam, supported by a wire stretched horizontally which passes through its centre of gravity. When twisted by the application of a weight to the beam, the elasticity of the wire acts the part played by the weight of the beam in an ordinary balance. For measuring horizon-

tal deflections caused by electric, magnetic, and other forces, the wire is stretched vertically.

For all forms of weighing machines of the equal armed type with small capacities, such as counter-scales, chemical and assay balances, etc., see **BALANCES AND SCALES**.

The majority of the machines of large capacity used for weighing heavy loads such as carts loaded with grain, hay, coal, building materials, etc., operate on the principle of the lever, and belong to the class designated as unequal-armed balances. They are also known as "decimal balances," and as usually arranged, the ratio between the small known weight on the weighing beam and the unknown weight on the platform or bridge, is indicated in multiples of ten. Such a balance consists of a lever (ab), suspended at (h), and connected by the rod (o), with two levers (r) and (s), hinged at (t) and (u), respectively. A platform (p), resting by means of standards upon the levers (r) and (s), accommodates the load which is counterbalanced on the long arm of the weighing beam or lever (ab), by a sliding weight—(w). When a load is placed upon the platform (p),

Decimal Balance.

the levers (r) and (s), are depressed, and exert a downward pull on the short arm of the weighing beam through the rod (o), with a consequent lifting of the long arm. This pull is counterbalanced by sliding the weight (w) along the long arm until it is brought into a horizontal position. The weighing beam being graduated with an adopted unit of weight and fractions thereof (usually pounds), the weight of the load on the platform is ascertained by a simple direct reading of the graduated scale. In the smaller scales, the weight (w) equals one pound, and counterbalances a load of 100 pounds upon the platform, but it is evident, that by varying the number of levers, and the relative lengths of their arms, any desired ratio between the load and the counter weight may be readily obtained. In scales used for weighing loaded wagons and cars, the ratio varies from 1 to 500, or 1 to 1,000. Cattle scales are capable of weighing from 10 to 200 head of cattle at a single operation, and the capacity of grain scales ranges upward of 500 bushels, while the large iron and steel manufacturing plants and gun shops, employ machines with capacities exceeding 100,000 pounds. The machine at Watervliet Arsenal, Troy, N. Y., used for weighing guns, has a capacity of 300,000 pounds.

Continuous weighing machines are employed to weigh automatically, material carried by conveyors, picking bands, etc., without interfering with the travel of the bands, and without requir-

WEIGHT THERMOMETER—WEIGHTS AND MEASURES

ing the tipping of the material, such as grain, sugar, coal, etc., into a weighing hopper and back again, with the attendant amount of breakage or loss, and the annoyance of dust. The principle upon which they operate is applicable to tramways.

Weight Thermometer. See THERMOMETER.

Weights and Measures. The science of measuring and weighing holds an important place in the factors of civilization. There is scarcely an art more universal or more vitally important. Weights and measures are fundamental necessities of commerce, industry, and science. Measurement is required in the exploration of lands and waterways, in their location and transfer, in the work of construction of buildings, bridges, railroads, and other engineering works, in the manufacture of foods, in the preparation of compounds, and in the purchase, shaping and sale of materials. Weights and measures are essential to all barters of goods. Here, the accuracy may range from the "heap" or "pile" of ancient times to the one one-hundredth of a cent used in cotton and spelter quotations "on change," estimates of value which we call prices being based on a specified weight of gold. Weights and measures are essential in all construction whether the precision be the "rule of thumb," or the millionth of an inch in optical work, or the one ten thousandth of an inch in the manufacture of fine machinery. The pharmacist with his weights compounds the prescriptions which mean health and life to the sick. In the extractive and compounding industries, weights and measures are used to determine the essential proportions in analyses and compounds, and precision is the main condition of reproducibility of results. Likewise the manufacturer must accurately weigh, measure, and test his materials to secure perfect construction. Surveying and navigation would be very primitive were it not for the rigorous measurements of base lines, accurate triangulation, precise leveling, including even such delicate measurements as the variation of latitude. Weights and measurements will in fact be found necessary in the discovery and in the statement of industrial and scientific facts of all kinds. The birth of the exact sciences was coincident with the development and application of quantitative measurements to the phenomena of nature, and the rapid growth of modern science has since been parallel with that of precision. James Watt was one of the earliest to suggest international standards which would enable scientific results when published in terms of such standards to be intelligible and reproducible the world over. Precise and uniform standards made possible the interchangeability of parts in machinery, first practically applied by Eli Whitney and to-day one of the most important principles in manufacturing.

Classification.—Weights and measures ordinarily include length, area, volume, capacity, and weight (or mass). These are relatively the most important kinds of measures used by

man. However, within the last half century when such products as power, electric current, heat, light, refrigeration, and services of other kinds have entered the world's markets as commodities for manufacture, purchase, and sale,—the scope of weights and measures has widened to include units used in the measurement of velocity, pressure, energy, electricity, temperature, and illumination. Technical requirements also resulted in a series of compound units such as the knot, a unit of speed for vessels of one minute of the earth's circumference per hour; the ton-mile used in transportation rates and statistics; the foot-pound, a unit of energy; the dyne, the international unit of force, and other units of the centimetre-gram-second system of scientific units in use throughout the world. Such compound units are multiplying apace with the technical needs, and have proven of inestimable value and economy by the facility and precision which they afford in conveying exact quantitative results of experiment and observation. With advancing needs the units of weight and measure have extended to microscopic and to telescopic dimensions. The millimicron of the physicist and the still smaller Angstrom unit of which it requires 254,000,500 to make one inch, are used in spectrum analysis for measuring the dimensions of light waves, while on the other hand the "earth's orbit" is used by astronomers in measuring stellar distances. In addition, the "light-year" is used for the greatest distances, this unit being the distance which light traverses in one year, or about 6,000,000,000,000 miles. With the extension and division in size of units, the kinds of instruments and methods of application of the units themselves have multiplied. Almost every occupation has its particular units, its methods of measurements, and its special measuring instruments. A few of the thousands of the latter may be cited, such as the common rulers, carpenter's folding rules, draughtman's scales, surveyor's chains, engineer's tapes and level rods, lumberman's log rules and board measures, the merchant's yard stick, the tailor's tape, the shoe, glove, and heat-measures, machinist's scales, measuring bars, micrometers, micrometer calipers, limit gauges of ring and plug types, end and line standards of precision. In measuring volume we have the standard capacity measures, milk measures, beer measures, wooden dry measures, a vast variety of standard flasks, glass graduates such as burettes, pipettes, and other volumetric apparatus of the druggist, physicist and chemist, the gauging rods for casks and cargoes, gasometers reading in cubic feet, tanks and reservoirs with graduated scales reading volumes directly. For weighing, we have even balance scales, steelyards, platform scales, spring balances, all ranging from the most delicate analytical balances to the master scales for weighing canal boats and railway trains. Scales are especially designed for every particular need, and the countless varieties attest the high state of the art of weighing and its great importance in industrial and scientific work. Such instruments have multiplied in form and number, and the demand for them has grown so rapidly that the manufacture of weights, measures, and measuring instruments forms in itself a whole group of industries.

With the development of units of measure of the order of inter-molecular distances on the

WEIGHTS AND MEASURES

one hand and of almost interstellar distances on the other, and the multiplication of kinds of instruments used in measurement has come the invention of a large variety of measuring appliances which automatically indicate the result upon a scale. Of this class are thermometers, spring balances, aneroid barometers, pressure gauges, speedometers, and indicating meters of all kinds. Computing scales not only indicate the weight but show the computed total price of the article at each possible price per pound. Many of this class of instruments also make continuous record of the measurements showing by a curve the values at successive moments of time. Of this type are the automatic recording instruments used to record temperature, air pressure, sunshine, rainfall, electrical quantities as well as tide recorders, anemometers and many others. Equally interesting are those measuring instruments like dividing engines, trip scales, or trip measures which besides measuring definite lengths, weights or quantities automatically perform certain operations such as graduating a scale, delivering or tipping a certain weight of grain, or delivering certain volumes of liquids. Closely related are those devices which integrate quantities delivered or magnitudes measured, such as the small map wheels which measure distances on maps, or the planimeters which measure areas within irregular contours, and all forms of gas and water meters, integrating rain gauges, integrating watt meters for measuring electric power consumed. These instruments usually indicate on a dial the total number of units measured since the last zero setting.

Metrolgy.—Many sciences and industries have given the science of metrology their best thought and labors. Chemistry opened up new chapters in the science of the refractory metals, developing iridium and platinum of purity requisite for the world's fundamental standards of mass and length, producing in conjunction with metallurgy the remarkable "invar" nickel-steel alloy having practically a zero temperature coefficient of expansion, the alloy manganin free from temperature coefficient for electrical resistance, the Jena glass, a material for measuring flasks and thermometer bulbs which practically eliminates temperature disturbances. To optics and the glass industry we are indebted for the microscopes, telescopes, polariscopes, and other optical instruments which form essential parts of modern measuring apparatus. Optical methods based upon the interference of light waves have made possible the detection of changes of dimension far beyond the power of the microscope to detect. By such methods plane glass surfaces are produced having errors of less than a millionth of an inch, and in the interferometer is provided the most delicate and sensitive length-measuring instrument known to man. Metallurgy and engineering have developed methods of fusing, casting, and tempering materials to be used in measuring apparatus, and have developed the accurate machining of such instruments. Astronomy has given the precision measurements of time, the "second" being the unit of time in the international C. G. S. system of units. Mathematics has devoted a large section of its science to the theory of observations and added rigor in their adjustment, and in the elimination of accidental errors, and by developing the theoretical side of precision measure-

ments has rendered the greatest service to metrology.

Unit Standards.—The standards of length and mass are fundamental. From these and the unit of time practically all other standards are derived, either directly or indirectly. The derived standards include those used in the measurement of volume, density, capacity, velocity, pressure, energy, electricity, temperature, illumination, and the like. The production of copies, multiples, and subdivisions of the fundamental standards, the construction of the derived standards, and the comparison of the standards used in scientific work, manufacturing and commerce with the fundamental or derived standards of the government are functions of the Bureau of Standards in the United States and of similar bureaus in other countries. In the United States the standard of the weights and measures of trade is maintained through the State, county, and city scalers of weights and measures with an efficiency dependent upon local administration. For more precise purposes, however, uniformity and precision are attained and maintained only by regular reference of the local standards to the fundamental standards of the government, at the Bureau of Standards in Washington.

The units of weight and measure in the United States are practically those used in the colonies prior to the formation of our government. While Congress has never definitely authorized the weights and measures in common use, it has sanctioned their use by its act of 14 June 1836, providing that accurate copies of the yard, pound, etc., be furnished as standards to each State of the Union. The constitutional power "to fix the standard of weights and measures," vested in Congress (I. 3, § 5, U. S. Constitution) has rarely been exercised, so that legislation on weights and measures has been confined to the individual States, and in this manner numerous differences in usage have grown up in the several States, although the same general system of weights and measures prevails throughout the country. The customary units of length are defined by reference to the yard. The yard itself was formerly defined as the length of a certain brass bar, the standard yard, kept at the Office of Standard Weights and Measures in Washington. Since 1893 the yard is defined in terms of the international metre. The yard appears to have been a unit of length in England since very early times. The name signified in Old English and in Anglo-Saxon (gyrd) a rod or stick. A standard bronze yard of 1496 still exists in England, having been used for the verification of other yards until 1588, when a new standard was made which is also in existence to-day. This yard, known as the Winchester standard, was the legal standard in England until 1824, when new standards, the Imperial standards, were authorized.

When the Coast Survey was organized it was found necessary to have a definite standard of length, and an 82-inch bar was secured from the instrument maker, Troughton, of London. This bar was nearly a copy of Troughton's scale, and had not been compared with the British standard yard, but the distance between the 27th and 63d inch marks on the bar was taken as representing the standard yard, and was made the basis of the standards sent out

WEIGHTS AND MEASURES

in accordance with the act of Congress of 1836. In 1834 the British Imperial yard was destroyed by fire and when a new standard had been prepared, copies of it were made, two of which were presented to the United States in 1856. These copies were compared with the Troughton scale, and the latter was found to be 0.00083 inch longer than the new Imperial yard at the standard temperature of 62° F. One of the copies was then accepted as standard by the United States Office of Standard Weights and Measures in place of the Troughton scale. This copy of the Imperial yard was the standard on which all measurements of length in the United States were thereafter based until 1893, when the yard was defined in terms of the International prototype metre. The matter had been left entirely to the Treasury Department, which had adopted different yards from time to time, assumed to be equal to the British Imperial yard.

The copies of the Imperial yard had shown noticeable changes relative to the standard when subsequently compared, and this led to the belief that the Imperial yard itself was not constant. Shortly after the arrival of the National prototype metre, a careful determination of the relation of the Imperial yard to the International metre at the Office of Standard Weights and Measures showed that the relation differed from that legalized in 1866 by less than the uncertainty of the comparison, and it was decided to adopt the metre as the fundamental standard of length and to define the yard in terms of it. Not only is the constancy of the length of the Imperial yard suspected, but in addition the lines, which are about 1-1000 of an inch wide, are much too broad for present requirements. On the other hand, the International metre and its copies satisfy the rigorous requirements of modern metrology. The kilogram was also declared to be the fundamental standard of mass. The present standards of the United States are therefore independent of the British standards and in part differ from them. The prevalent idea that the weights and measures in common use are identical with the British Imperial system is therefore erroneous. The United States yard is slightly longer than the Imperial yard and this inequality extends to all of its subdivisions and multiples. The present material standards of the United States are the National prototype metre No. 27 and the National prototype kilogram No. 20, received by the President of the United States on 2 Jan. 1890. These are accurate copies of the International prototype metre and kilogram which are the fundamental standards of length and mass for the entire world. The latter standards are preserved at the International Bureau of Weights and Measures in accordance with the International Metric Convention of 1875, now signed by all the leading countries of the world, including England, Russia, and the United States. These countries jointly maintain and direct the work of this bureau through official representatives forming an international committee, composed of eminent scientific men from all parts of the world.

The units of length, and the derived units of area, volume, and capacity are derived from the International metre in the ratio of 1 metre = 39.37 inches (Law of 28 July 1866). Since 1893 the Office of Standard Weights and Measures and the Bureau of Standards which superseded

that office have used the equivalent 1 yard = 3600-3937 metre (by order approved 5 April 1893). This action fixed the values, inasmuch as the reference standards are as perfect and unalterable as human skill could make them. Besides the yard, the units of length most universally employed in the United States at the present time are the inch, foot, and mile.

The "inch" is the 1-36 part of the yard and like it has been in use since ancient times. The name (derived from the Latin *uncia*, meaning the twelfth part) occurs in Anglo-Saxon in the form of *ynce*. It probably originated only as a convenient subdivision for the foot. Lengths shorter than one inch are commonly expressed in fractions of an inch. Two methods of subdivision are in common use; among builders and wood workers it is customary to use the binary subdivisions, half, quarter, eighth, etc., but machinists also divide the inch into tenths, hundredths, and thousandths. The inch is usually denoted by the symbol " ' "; but botanists use the symbol " ' " for the inch. The "miner's inch" is a rather vague unit for the flow of water varying from 1.36 to 1.73 cubic feet per minute, and is the flow of water through each square inch of an orifice under varying heads of water. The "inch or gauge of cream" is fixed by Iowa statute as equal to $\frac{1}{2}$ gallon.

The "foot" is legally defined as $\frac{1}{3}$ of the yard or 12 inches. As its name implies it was probably based on the length of the human foot. Almost every nation, ancient and modern, has had a unit called the "foot," its value differing somewhat, as might be expected with a unit of so crude an origin. Most countries, however, have now adopted the metric system, the foot being discarded as an official measure, though still widely used in English countries. Lengths shorter than one foot are usually expressed in inches and fractions of an inch, but among surveyors and civil engineers it is quite common to use decimal fractions of the foot. The foot is generally denoted by the symbol " ' ", but botanists use the symbol " ' " to denote feet. Some artisans use the foot and the inch but not the yard, others the yard and its binary divisions, but not the foot or inch. Thus the foot and inch are used to the exclusion of the yard in building, while the yard and its binary subdivisions to the exclusion of the foot and inch in measuring cloth, and surveyors in surveying public lands use neither the yard, foot nor inch. (See LINK.)

The "statute" or "land mile" is the unit most commonly used for longer distances and is equal to 5,280 feet. The name is from the Latin *mille passuum*, 1,000 paces, the Roman pace being a double step and consequently about five feet in length. This mile was used by the Anglo-Saxons. Almost every European nation has had a unit called the "mile" but widely at variance with one another, ranging from about $\frac{1}{3}$ of the United States mile (Holland) up to seven United States miles (Norway). The British statute mile is slightly shorter than the United States mile. Since the introduction of the metric system, these old miles are being superseded by the kilometre, which is a fixed and definite unit the world over.

The following units of length are used in special work and are arranged in the order of their magnitude. Metric units are not included, although their use is steadily increasing. (See METRIC SYSTEM.)

WEIGHTS AND MEASURES

Mil (.001 inch) is used in electrical work, especially in indicating the cross section of wires.

The point (1-72 inch) is used in designating the sizes of type, the point system designating the sizes of type by the number of seventy-seconds of an inch height of the type face. The em is a unit of measure used in composition and varies with the size of the type, usually being considered as the square of the face height.

The line (1-12 inch) is little used, mechanics preferring to divide the inch into tenths, hundredths, and thousandths. It is used by printers and by botanists, the latter denoting the line by the symbol ℓ . The line "button measure" is 1-40 inch as defined in the tariff act.

The barleycorn ($\frac{1}{3}$ inch) is an old unit still surviving in shoemakers' shoe sizes, these being graded by thirds of an inch or barleycorns, in a system of thirteens.

Four units based upon the "hand" are sometimes used. These are the nail (2 $\frac{1}{4}$ inches) for measuring cloth, originally the distance from the end of the thumb nail to the joint at the base of the thumb, and later fixed as 1-16 yard; the palm (3 inches) includes the breadth of the hand exclusive of the thumb; the hand (4 inches), originally the breadth of the palm, is used in measuring horses and is almost exactly one decimetre; the finger (4 $\frac{1}{2}$ inches) is about the length of the middle finger and is only used as a rough unit in cloth measure. This should not be confused with the finger breadth used in measuring charges of powder.

The surveyor's link (7.92 inches) is the length of one link or 1-100 part of a surveyor's chain, and is used in the survey of lands.

Quarter (9 inches) is sometimes used in measuring cloth (more frequently in Great Britain) to designate a quarter of a yard. A unit of the same length called the span was originally half a cubit, but probably has not been used in modern times as an officially recognized unit.

The engineers' link (12 inches) used as a unit in engineering is the hundredth part of the engineers' chain, and is decimally divided. The tenth of the engineers' link is 1.2 inches and is easily confused with the inch.

The pace is a conventional unit for measuring distances and is measured from the heel of one foot to that of the other, and a full pace measures about one yard. This is the value of the United States military pace, double time, with a cadence of 3 steps a second. The regulation military pace quick time is 30 inches with a cadence of 2 steps per second. The Roman pace was a double step of about 5 feet.

The ell, a unit still referred to but seldom used, having a value of 45 inches, varying, however, in different places.

The fathom (6 feet) is used in measuring depths of water or mines. The name comes from an Anglo-Saxon word *faethm*, signifying "embrace," and originally meant the length of rope between the two hands when the arms were held outstretched.

The rod, perch, or pole, is equal to 5 $\frac{1}{2}$ yards and is used in measuring land. It has varied in different places from 5 to 8 yards and is supposed to have been the length of the ancient goad used to measure the width of the first furrow.

The surveyors' or Gunter's chain (22 yards)

was so chosen that ten square chains might equal exactly one acre. This chain is the official unit prescribed for the use of surveyors surveying public lands under the supervision of the surveyor general.

The engineers' chain (100 feet) is used in engineering, and is decimally divided into feet, tenths, and hundredths of a foot. The use of the two chains in many cases for the same land for different purposes requires reduction tables. On account of the direct relation to the foot, the engineers' chain is becoming very widely used.

The bolt for measuring cloth is generally given as 40 yards, though the name means a roll of definite length simply. The customary length of the bolt varies with different fabrics and manufacturers.

The skein for yarn is often defined as 120 yards. Its length varies, however, according to the material and the locality. Consult International Yarn Tables, New York (1903).

The United States cable's length (720 feet), used by mariners, is 120 fathoms as recognized by the United States navy.

The furlong (220 yards) originally meant "length of a furrow," supposed to be the distance oxen could plow without stopping to rest.

The hank is a unit of length for yarn. In this country the length of a hank of cotton is usually 840 yards, while that of linen is 3,000 yards; different lengths, however, are also in use.

The nautical mile or geographical mile has been defined as 1-60 part of the length of a degree of a great circle of the earth. Since the earth is not a perfect sphere, however, the degree varies in length and this has led to much confusion in usage regarding the nautical mile. The definition accepted by the United States Coast and Geodetic Survey (consult Report of 1881, Appendix 12) is as follows: the 1-60 part of the length of a degree on the great circle of a sphere whose surface is equal to the surface of the earth. This makes the length of the nautical mile 6080.20 feet or 1853.248 metres. The uncertainty in the dimensions of the earth affects the last decimal place given. The nautical mile is often miscalled "knot." The latter term, however, is not a measure of length, but a measure of speed, equal to one nautical mile per hour. The admiralty "knot" of Great Britain is 6,080 feet.

The league is equal to three miles, the land league being equal to three United States statute miles (15,840 feet) and the United States marine league to three nautical miles (18,240.6 feet). Its value varies in different countries. The marine league is the distance from shore over which a country has jurisdiction under international law.

The degree is equal to about 60 nautical miles.

The astronomical unit equal to the mean radius of the earth's orbit or nearly 93,000,000 miles, is sometimes used in stating astronomical distances.

In stating interstellar distances it is sometimes found convenient by astronomers to use the light year, a still larger unit, being the distance traversed by light in one year, or 65,700 astronomical units.

Besides the measures of length given above,

WEIGHTS AND MEASURES

there are numerous very special methods of denoting length in case of special commodities. The thickness of sheet iron and steel is denoted by a system of arbitrary gauge numbers. The numbers in use differ for different products. On 3 March 1893 Congress passed an act establishing a standard gauge for sheet and plate iron and steel for use in the custom service. In this system the gauge numbers indicate thickness, or the weight per unit area. Sizes of wire are also denoted by a special system of arbitrary gauge numbers. The number of different systems which have been used is quite large. Pfeilschmidt's 'Wire and Sheet Gauges of the World' (1895) gives comparative tables for 11 systems of wire gauges. At present the most common gauges in use in this country are the Brown and Sharp gauge and the Birmingham wire gauge. The fineness or coarseness of yarn is denoted by a system of "numbers," which indicate usually the number of hanks of the yarn in question which will weigh one pound. Thus No. 10 yarn (English cotton yarn and spun silk count) is a yarn of such fineness that 10 hanks (of 84,000 yards) are required to make a weight of one pound, or again No. 1 wool (Aberdeen count) is such that one spindle (of 14,400 yards) shall weigh a pound. There are about 24 different systems of counts in use, and in order to introduce uniformity in counting textile yarn throughout the world, the international metric count was approved by the International Paris Conference of 1900. According to this count, No. 1 means that a length of 1 metre will weigh 1 gram, and 100 metres of No. 100 yarn will weigh 1 gram.

In addition to the above there are a large number of special systems of numbering particular commodities such as hats, shoes, gloves, nails, cordage, books, and other articles, too numerous for description. The growing use of the metric system is introducing uniformity and simplicity in commercial transactions and manufacturing as it has done in scientific work.

The units of superficial measure or area are usually the squares of the linear units and as such need but little comment. The circular mil (.7854 square mil) is the area of a circle .001 inch in diameter. One circular inch contains 1,000,000 circular mils, and one square inch contains 1,273,240 circular mils. The square inch is the most common small unit of area, being used in measuring pressures, strength, and other properties of materials, and in engraving, cloth analysis, and many other purposes. The square foot (144 square inches) is also largely used. It is the basis of the board foot which is 144 cubic inches of undressed lumber, being reckoned as one square foot of one inch board, or its equivalent. The "square" is a unit used in carpentry for flooring, ceiling, and shingling, and contains 100 square feet, architects' and builders' measure.

In surveyors' measure 1 acre = 10 chains = 160 square poles = 100,000 Gunter's or surveyors' links. The acre (43,560 square feet) was probably as much land as could be tilled in a day and therefore of rather indefinite extent until later times. It is a unit of the same order as the French *journée* and the German *Morgen*. The acres of various countries differ in size, for example, the Irish acre, Scotch acre, Cheshire acre, Cunningham acre, and the Imperial acre.

In subdividing public lands in the United States, the lands are laid out in townships. One township = 36 sections or square miles = 144 quarter sections = 23,040 acres. The "homestead" is a free grant of public land having a maximum area of one quarter section or 160 acres. In the Philippine Islands, the "homestead" is 64 hectares, which is almost identical with the homestead as defined above.

Among the more important units of volume are the cubic inch, the cubic foot, the cubic yard, and the cubic mile. The cubic inch is practically the smallest unit of volume based directly on linear units. It is very largely used. The cubic foot (1,728 cubic inches) is used in engineering to express volumes of gas, water, or other solids. In some States, such as Washington and Colorado, the cubic foot is established by statute as the legal unit for measuring the volume of water. A special system of units is used in the measurement of wood; 144 cubic inches or 1 foot square of one inch board equals one board foot. A timber foot, however, is 1,728 cubic inches or one cubic foot. A cord foot is a pile of wood 1 x 4 x 4 feet. A cord of wood is 8 cord feet. In the lumber business boards are usually bought and sold by the 1,000 board feet to simplify computation. In New Hampshire, a measure for lumber was adopted in 1866 based upon an "imaginary cubic foot" equal to about 1.4 cubic feet. This unit is also used in parts of Maine and Vermont. Round timber is measured as follows: "A stick of timber 16 inches in diameter and 12 inches in length shall constitute one cubic foot, and the same ratio shall apply to any other size and quantity. Each cubic foot shall constitute 10 feet of 1,000 board feet." In the practical use of this rule it is customary to consider 115 cubic feet equivalent to 1,000 board feet, instead of 100 cubic feet, according to the wording of the statute. In this case the diameter is taken at the middle of the log inside the bark. If the diameter is measured at the small end of the log, 106 cubic feet are allowed for 1,000 board feet. The New Hampshire rule is called the Blodgett Rule. The Doyle is the standard of log measurement in Arkansas for logs cut and sold or hauled. A large variety of log rules is in use throughout the country. These are locally accepted as standards, but they differ among themselves in so confusing a manner as to make it impossible to give an accurate and complete statement concerning them. The cubic yard is used largely in engineering and in computing grading, cuts, and fills, a cubic yard being equal to about one load.

The perch, in addition to being a unit of length and a unit of area, is also widely used as a unit of volume of brickwork and masonry. The perch of brickwork, however, is a widely varying unit, ranging from 16½ cubic feet to 25 cubic feet. In Colorado it is 16½ cubic feet, in Philadelphia 22 cubic feet, 25 cubic feet in North and South Dakota, 24¾ cubic feet in other places. The latter perch is equal to a section of brickwork 1 x 1½ feet by 16½ feet or one perch in length.

A cord of masonry is usually reckoned at 100 cubic feet, although in some cases it is 96 cubic feet.

The cubic mile is used in expressing very large volumes, such as the silt carried by rivers.

Liquid Measure.—The fundamental unit of

WEIGHTS AND MEASURES

liquid measures in the United States is the wine gallon of 231 cubic inches—a unit abandoned by England in 1824, but now generally adopted by the various States of the Union. The British Imperial gallon measures slightly more than 277 cubic inches, and is the volume of 10 pounds of water under specified conditions. The liquid measures of the United States unfortunately bear no relation to those of England. Much confusion is occasioned by the use of the ambiguous term gallon, as there are in the United States the wine gallon (231 cubic inches), the ale, beer, or milk gallon (282 cubic inches), and the dry gallon, besides the "proof gallon," the unit for internal revenue taxation. The "proof gallon" is a wine gallon of spirits containing one half its volume of nearly pure alcohol at 60° F. and is the basis for computing the United States internal revenue tax. For example, a gallon of spirits containing 40 per cent alcohol would be 80 per cent proof and the number of proof gallons is computed by multiplying the per cent of proof by the number of wine gallons. Wisconsin and Connecticut still retain the dry gallon of 282 cubic inches as a legal standard. New Hampshire and Minnesota definitely retain the ale, beer, or milk gallon of 282 cubic inches, and Maine definitely mentions the same unit among its list of State standards. A recent Minnesota statute (1902) provides that the "Beer and milk measures shall contain the following capacities: The gallon shall contain 282 cubic inches. The half gallon shall contain 141 cubic inches, and the quart one half as much, and the pint one half as much as the quart." The milk gallon thus established is 51 cubic inches larger than the standard gallon used more generally throughout the country. There are thus three different quarts, the dry quart derived from the Winchester bushel, the liquid quart derived from the wine gallon, and the liquid quart derived from the beer or milk gallon. The differences, of course, extend proportionately to all the multiples and subdivisions of these units. The ordinary liquid measures are usually 1 gallon = 4 quarts = 8 pints = 32 gills. In addition to the capacity measurement by volume, the legal weight of a gallon of certain commodities have been fixed by statute in some States, and in several cases by Congress for certain purposes. Thus 12 pounds of strained honey is a legal gallon in Nebraska, 6½ pounds of kerosene (Kansas), and 7½ pounds of kerosene in Ohio, 11 pounds of sorghum molasses (Indiana), 8 pounds of castor oil (Kansas) are all legal gallons of the products named. These legal weights differ among themselves, and do not accord with the true volume of one gallon of 231 cubic inches.

The subdivisions of the gallon, the quart, pint, and gill are largely used in trade. In addition to the general liquid measures enumerated above, apothecaries have a special system of capacity measures based on the volume of the United States liquid pint of 28.875 cubic inches. One pint = 16 United States fluid ounces = 128 United States fluid drams = 7,680 United States minims.

The United States minim is the smallest of the units of volume and is about 0.00376 cubic inch. A minim of pure water weighs about 0.95 grain and corresponds to the "drop," which it approximates in size. The United States

minim is about 4 per cent larger than the British Imperial minim. It is denoted by the symbol *m*.

The drop varies from 0.02 to 0.1 cubic centimetre and is not a fixed unit, but is convenient for use in dispensing very small quantities of liquids. It is not subdivided and its size depends upon the liquid and the method of dropping. The ordinary form of drop pipette of the ophthalmologist delivers drops of about a half United States minim.

The United States fluid dram (60 minims) is equal to ⅛ United States fluid ounce, its volume differing from the volume of one avoirdupois dram of water, from the volume of one apothecaries' dram of water (by weight), and is about 4 per cent larger than the fluid dram in use in Great Britain. It is about 4 cubic centimetres, or an average teaspoonful, and is denoted by the symbol *f*5.

The United States fluid ounce (480 United States minims) is the 1-16 part of the wine pint and has a volume of about 1.8 cubic inches. It differs from the British unit of the same name as well as from the volume of the avoirdupois ounce of water and the troy or apothecaries' ounce of water. Other measures of less definite character are often found convenient, such as the teaspoonful, dessertspoonful, tablespoonful, wineglassful, and teacupful. They do not contain exactly the quantities usually given arbitrarily, but more exactly the common spoonfuls contain the following quantities: A tablespoonful, 5 fluid drams or 20 cc.; a dessertspoonful, 2 fluid drams or 10 cc.; a teaspoonful, 60 minims or 5 cc.

Dry Measures.—The dry measures in general use in the United States bear no direct relation to the liquid measures of this country or Great Britain. The following are the ordinary units of dry measure: One bushel = 4 pecks = 32 dry quarts = 64 dry pints. The fundamental unit is the Winchester bushel, a unit abandoned by England in 1824, but still retained in general use in this country. The Winchester bushel has a volume of 2,150.42 cubic inches and is about 69 cubic inches or 3 per cent smaller than the Imperial bushel of Great Britain—a proportionate difference existing in the subdivisions of the bushel. Conflicting State laws render difficult an adequate statement of the status of the "bushel" in this country. Although the standard Winchester bushel contains 2,150.42 cubic inches, Nebraska has established 2,150 cubic inches as the volume of a legal bushel for that State, and other States have made similar changes. Several States adopted the old ale or milk gallon as the capacity of the dry gallon, this being about 5 per cent larger than the corresponding unit derived from the Winchester bushel. Moreover, special bushels have been legally established in many States for particular products, such as the charcoal bushel, which in Connecticut is 2,748 cubic inches, in Colorado 2,500 cubic inches, in Kansas 2,564 cubic inches, in Pennsylvania 2,571 cubic inches, and in Minnesota 2,419.5 cubic inches (or ½ basket). In Vermont "one bushel and three quarters of a peck" are "deemed a bushel of charcoal, lime, or ashes." In some places five pecks constitute a bushel of "screened lump coal." A lime bushel in Minnesota is 2,688 cubic inches. In Pennsylvania, however, it is equal to the Winchester bushel, although the coke bushel is 2,648 cubic

WEIGHTS AND MEASURES

inches. In the adjoining State of Ohio the coke bushel is 2,688 cubic inches. In Idaho, the bushel of fruit is defined as 2,564 cubic inches and in Missouri as 2,680 cubic inches. Some States require, furthermore, "heaped measure," others "struck measure," the heap sometimes being required to be "as high as the article will admit," and elsewhere "as high as may be without special effort or design," and in still other cases, as in Connecticut, the heaped bushel is definitely fixed as 2,564 cubic inches. The many objections to buying and selling agricultural products by volume, such as the difficulty of detecting error or fraud, the variation in the size of the heap, the case of packing short quantity in a given volume, the effects of expansion, moisture, or shaking, and the general uncertainty of estimates of quantity based upon volume early led to the practice now quite general, of defining the bushels as definite weights for the different commodities. Unfortunately the matter was left to the several States with the result that the lack of uniformity in legislation and custom has introduced considerable confusion. Not only do the weights fail to equal the true volume of one Winchester bushel, but even for the same commodity and in adjoining States the values are widely at variance. In at least two cases the size of the bushel varies with the time of the year. For a few commodities like wheat and hard coal, the standard weight is fairly general—but for such commodities as fruits and vegetables there is but little uniformity. The values of the various bushels of apples vary by about 10 per cent and for beans and charcoal about the same proportion. The legal weights of the bushel of gooseberries or beets varies by about 20 per cent and for cranberries 17 per cent, for sweet potatoes and buckwheat the variation is about 28 per cent in range. The "bushel" has in fact become merely a name for a miscellaneous group of units varying from State to State and differing for the various commodities, sometimes, as in at least two cases changing with the time of the year. The uncertainty is confusing to trade and precludes the compilation of accurate statistics based upon so variable and ambiguous a term.

The barrel is a convenient receptacle for packing, transporting, and storing commodities. It varies in size, sometimes being defined in terms of units of volume, 6,253¾ cubic inches struck measure in Massachusetts. In other cases it is fixed as a definite number of units of dry measure, 100 dry quarts in New York, five bushels in Tennessee; or in some States as a definite number of liquid gallons, 36 gallons in Arkansas, 42 gallons in Tennessee, or more commonly 31½ gallons. Besides this method of definition the barrel, like the bushel and the gallon, is legally defined for certain commodities in terms of a definite number of pounds. The barrel of flour, for example, is commonly fixed at 196 pounds. Apart from this, but few States have used this method of defining the barrel and that only for a few products. Two hundred and eighty pounds of shelled corn constitute a legal barrel in Connecticut, 200 pounds of pork in Indiana, North Carolina, and Tennessee, 150 pounds of sweet potatoes in Massachusetts. In New York and some other States the several dimensions of the standard barrel are specified, although other forms con-

taining the same volume may be used. The dimensions specified in New York are head diameter 17½ inches, stave length 28½ inches, bulge not to exceed 64 inches outside measure. A barrel of crude oil is usually 31½ United States wine gallons and the barrel of refined oil 42 gallons.

The hogshead (two barrels), the pipe (four barrels), and the tun (eight barrels) are more commonly not intended as definite measures but merely convenient receptacles for liquids in bulk.

The smaller units of dry measure, such as the peck, dry quart, and dry pint, are largely used in retail trade, the pint and quart being used for smaller products like berries.

Avoirdupois System.—The avoirdupois system of weights is used for almost all commodities except the precious metals, chemicals, and jewels. The avoirdupois dram differs from the apothecaries' dram, and the avoirdupois ounce and pound differ from the troy units of the same name. Ambiguity is avoided only by properly qualifying the terms. The use of such unqualified terms as ounce, pound, or ton causes great confusion owing to the uncertainty and ambiguity of the terms. The "avoirdupois pound" or "troy ounce," however, are definite units. The avoirdupois units are as follows:

1 long ton = 20	long hundredweights = 80	long
1 short ton = 20	short hundredweights = 80	short
quarters = 2,240	pounds = 35,840	ounces = 573,440
quarters = 2,000	pounds = 32,000	ounces = 512,000
	drams = 15,680,000	grains.
	drams = 14,000,000	grains.

The fundamental unit of the avoirdupois system is the avoirdupois pound derived from the International kilogram, in accordance with the law of 1866 and the executive order of 1893, the value being 453.5924277 grams. The avoirdupois pound was probably derived from the Attic mina of 6845.3 grains Troy, the 1-60 part of the large Attic talent, divided by the Romans into 16 ounces of nearly the same weight as the modern ounce. Congress has never directly legalized any standard of weight except the Troy pound and that only for purposes of coinage. To avoid confusion in comparisons of mass, the ratio of the avoirdupois pound to the Troy pound was fixed at 7,000 to 5,760.

The United States avoirdupois dram (or drachm) is the 1-16 part of the avoirdupois ounce (28.3495 grams). This unit must not be confused with the apothecaries' dram (weight) which is the ¼ part of the apothecaries' ounce or 60 grains. The avoirdupois dram is largely used in the textile industries. The avoirdupois ounce is the 1-16 part of the pound and contains 16 drams. The avoirdupois stone is a denomination often used, especially in England, and varies with different commodity, the most common value being fixed in England as 14 pounds.

The hundredweight (cwt.) is the 1-20 part of the ton. The round hundredweight contains 100 pounds and is sometimes called the "cental," while the long hundredweight contains 112 pounds. This unit is used very largely in fixing transportation rates.

The commercial ton of 2,000 pounds is in very general use throughout the States, but 112 pounds is the legal hundredweight in many places, and 2,240 pounds the legal ton, as in

England. The long ton is the national standard in this country. The gross ore ton contains 2,688 pounds. Great confusion at present exists in the use of the word "ton," as the unqualified term may mean the short ton, long ton, gross ore ton, miner's ton, varying from 2,500 to 3,000 pounds, displacement ton of 35 cubic feet, shipping ton of 40 cubic feet, timber ton of 42 cubic feet, or register ton of 100 cubic feet. The register ton varies in different countries. Accurate statistics covering more than a single State or industry are impossible to obtain, owing to the difference in the values of these units and methods of measurement. The tariff act defines the ton of coal as "28 bushels of 80 pounds each" equal to the long or United States ton, but the statutory ton of coal in Montana is defined as $26\frac{1}{2}$ bushels of 76 pounds each. In some cases the ton is defined as a definite number of cubic feet, for example, 343 cubic feet is a legal ton of hay in North Dakota and Oklahoma, and in New Mexico the ton is defined as 380, 422, or 512 cubic feet, according to the time the hay has been stacked.

Troy Weights.—The Troy weights are as follows: One pound = 12 ounces = 240 pennyweights = 5,760 grains. The Troy pound was legalized in 1828 as the standard unit to be used by the Mint of the United States in the regulation of the coinage. In view of the confusion in the weights and measures of trade, Congress found it important to legalize some particular weight for the use of the Mint, and by the act of 19 May 1828 legalized the copy of the Imperial Standard Troy pound. This copy was procured by Albert Gallatin in England in the preceding year and was received by President Adams 13 Oct. 1827. It was based upon the old Imperial Standard Troy pound of 1758, legalized in 1825. This Troy pound has not been recognized as a legal standard in England since 1855, and was declared illegal, with penalty attached, in 1878.

The grain is the 1-5760 part of the Troy pound, and is the only unit which connects the Troy system with the avoirdupois. A very old English statute (51 Henry III., 1266) provided that the English penny should weigh "thirty-two grains of wheat, well dried, and gathered out of the middle of the ear." Fifteen different values of the grain in different countries are cited, varying from 0.68 to 1.54 United States Troy grains. The Troy grain, as used in the United States, is 0.0648 grams. The diamond grain is 0.8 Troy grain. The Troy grain is practically obsolete in the avoirdupois measures. Fractions of the grain are usually indicated decimally.

The pennyweight is the 1-240 part of the Troy pound. Some 18 different values are recorded, varying from 7.42 grams to 24 United States grains.

The Troy ounce is the highest Troy denomination permitted in England, and is used in stating quantities of silver and other precious metals. In assaying the Troy ounce is frequently divided decimally. The silk Troy ounce according to Troemner is the 1-16 of the Troy pound and contains 360 grains. One hundred and seventy-five Troy ounces equals about 192 avoirdupois ounces.

The units of apothecaries' weights are as follows: One apothecaries' pound = 12 ounces

= 96 drams = 288 scruples = 5,760 grains. The apothecaries' pound is equivalent to the Troy pound in the United States, but in England the apothecaries' weights based on the Troy pound were discontinued in 1858 under authority of the medical act, and avoirdupois weights substituted in dispensing medicines. In the United States, the avoirdupois system is largely used in buying and selling drugs, although the metric system is rapidly coming into use and displacing the apothecaries' weights on account of its greater convenience. The apothecaries' grain is used in compounding prescriptions of the more powerful drugs. The United States apothecaries' scruple (20 grains) and the United States apothecaries' dram (60 grains) are still used in compounding prescriptions. The United States apothecaries' ounce (480 grains) is equal to the Troy ounce. The apothecaries' pound (equal to the Troy pound) is rarely used.

The units used in the weighing of diamonds are as follows: One diamond carat = 4 diamond grains = 64 parts. The carat is the jewellers' unit for weighing diamonds, the name referring to a small hard bean formerly used for that purpose. In view of the variation in the value of the carat in different countries, its weight was fixed by agreement of London, Paris, and Amsterdam jewelers, in 1878, at exactly 205 milligrams. The following varieties of carats should be carefully distinguished: The international diamond carat of 205 milligrams, a definite unit free from ambiguity; the English diamond carat (3.2 Troy grains or four diamond grains) differing, however, in different countries; the old carat (1-24 Troy ounce); the gold carat (about 150 Troy grains); and the gold carat, a ratio equal to 1-24 part by weight used in designating the purity of gold alloys.

Director United States Bureau of Standards.

Weimar, vî'mär, Germany, the capital of the grand duchy of Saxe-Weimar, on the Ilm, 13 miles east of Erfurt. It stands in a beautiful valley surrounded by hills, on ground partly elevated and partly flat. It is irregularly

WEIMAR—WEISHAUPT

built except in the suburban portions. Its notable public edifices are the grand-ducal palace, a handsome structure erected partly under the superintendence of Goethe; the so-called Red and Yellow castles, now united and occupied by several public departments; the grand-ducal library (in the Green Castle), containing 180,000 volumes; the museum; the Stadtkirche, with an altar-piece, one of the finest works of Lucas Cranach, in which he has introduced portraits of himself and Luther and Melancthon; and the modern Gothic town-house. The public monuments comprise the Goethe-Schiller monument in bronze, statues of Herder, Wieland, the composer Hummel, the Grand-Duke Karl August, and various others, and a monumental fountain. Goethe's house is now used as a Goethe National Museum, and Schiller's contains relics of its former distinguished owner. A Goethe and Schiller Archives building was opened in 1896. Goethe and Schiller are interred in the grand-ducal vault in the new cemetery. Stretching away from the palace is a fine park on the banks of the Ilm. Weimar has a gymnasium, a real-gymnasium, academy of painting, school of drawing, normal school, and other educational institutions. It has neither trade nor manufactures of much consequence, but as the capital of the duchy it is the seat of the legislature and of all the more important courts and public offices. It long ranked as a sort of "German Athens" in consequence of the enlightened patronage which the Duke Karl August (d. 1828) afforded to Goethe, Schiller, Herder, and Wieland. Pop. (1900) 28,489.

Weimar, Texas., a town of Colorado County, 16 miles west of Columbus, the county-seat; on the Southern Pacific railway. It has manufactures of blueing, vinegar, sash and doors, and agricultural implements; oil-mills; one private and two public schools; two private banks; and six churches. Pop. (1890) 1,443; (1900) 1,337.

Weingartner, vîn'gärt-nër, **Felix**, Austrian composer: b. Zara, Dalmatia, 2 June 1863. He studied at the Leipsic Conservatory, having received a government scholarship, and in 1884 his opera, 'Sakuntala,' was brought out at Weimar under the patronage of Liszt. He was musical conductor at Königsberg, Dantzic, and Hamburg in 1884-9, and in 1891 was appointed court conductor at Berlin. Ill health compelled the resignation of this post, and in 1898 he settled in Munich as conductor of the Kaim concerts. He has composed numerous songs, several symphonic poems, the operas: 'Malawika' (1886); 'Genesius' (1892); etc. He has written: 'Die Lehre von der Wiedergeburt und das Musikalische' (1895); and 'Beyreuth 1876 bis 1896' (1897).

Weir, wër, **Harrison William**, English artist and journalist: b. Lewes, Sussex, 5 May 1824. He learned the art of wood-engraving, but disliking it, turned to painting, and as an artist is almost wholly self-taught. His first exhibition at the British Institution was in 1843. He is the only survivor of the original staff of the London 'News,' and has been engaged on the 'Graphic,' 'Pictorial Times,' 'Black and White,' and other London periodicals. He is an authority on the correct delineation of domesticated animals, is noted for his paintings

of country life, and as an illustrator of books and periodicals. He wrote and illustrated: 'The Poetry of Nature'; 'Every-day Life in the Country'; 'Our Cats and All About Them'; etc. Perhaps his greatest achievement is his work 'Our Poultry and All About Them' (1903), the writing and illustrating of which claimed his attention for more than 20 years.

Weir, **James**, American physician and author: b. Owensboro, Ky., 17 Oct. 1856. He was graduated from the University of Louisville in 1878 and studied medicine there, and at Bellevue Hospital, New York. He has published: 'Religion and Lust' (1897); 'The Dawn of Reason' (1898); 'Intelligence in the Lower Animals' (1898).

Weir, **John Ferguson**, American painter and sculptor, son of R. W. Weir (q.v.): b. West Point, N. Y., 28 Aug. 1841. He was a pupil of his father and became a member of the National Academy in 1866. Since 1869 he has been professor of painting in the Yale School of Fine Arts. As a sculptor he is known by his statues of President Woolsey and Prof. Silliman of Yale, and in addition to many portraits he has painted 'The Gun Foundry'; 'The Forging of the Shaft'; 'The Column of St. Mark's, Venice'; etc.

Weir, **Julian Alden**, American artist, son of R. W. Weir (q.v.): b. West Point, N. Y., 30 Aug. 1852. He studied with his father, and at Paris, with Gérôme, became a member of the Society of American Artists in 1877 and a National Academician in 1886. He has made a specialty of portraits and genre, his 'Idle Hours,' now in the Metropolitan Museum, New York, receiving the \$2,000 prize of the American Art Association, and his 'Breton Interior' obtaining a second class medal at the Paris Exposition of 1889. About 1887 he abandoned his former grave manner and has since been known as one of the Impressionist school.

Weir, **Robert Walter**, American artist: b. New Rochelle, N. Y., 18 June 1803; d. New York 1 May 1889. After studying under Jarvis he began portrait painting in 1821 and then studied in Florence under Benvenuti, 1821-8. In 1829 he became a National Academician and was professor of drawing at West Point 1837-79. He was of especial prominence as a historical painter, and among his works are the 'Embarkation of the Pilgrims' (1845) in the rotunda of the Capitol at Washington; the 'Church of the Holy Innocents' (1847), Corcoran Art Gallery, Washington; and 'Peace and War,' painted for the chapel at West Point.

Weir, a dam or dike across a river or stream to raise the level of the water for the purpose of diverting it to drive machinery, irrigate land, or to render the upper portion of the stream navigable, or for some other purpose. A weir is constructed of stone, or, as in the United States, of timber, crossing the river at right angles or obliquely. The term is also applied to an escape pipe for carrying off surplus water from a reservoir.

Weirs, **Fishing**. See POUND-NET FISHING.

Weishaupt, vis'howpt, **Adam**, German mystic: b. Ingolstadt 6 Feb. 1748; d. Gotha 18 Nov. 1830. He was the founder of the Society of the Illuminati (q.v.). Educated at Ingolstadt, he there became in 1772 extraor-

inary professor of law, and in 1775 professor of natural and canon law. His appointment to the latter post brought him into collision with the clergy, especially the Jesuits, as after the suppression of their order he became their bitter enemy, although he had been educated by them. He formed the plan of uniting a large number of men together to sustain certain perfectionist views, and his instruction-room soon became a nursery of his doctrines. In 1785 he was obliged to leave Ingolstadt, and retired to Gotha, where he was afterward made councillor of state by the duke. His most important writings are: 'Geschichte der Verfolgung der Illuminaten' (1786); 'Das verbesserte System der Illuminaten' (1787); 'Pythagoras, oder Betrachtung über die geheime Welt- und Regierungskunst' (1790); 'Materialien zur Beförderung der Welt- und Menschenkunde' (1850); 'Ueber Staatsausgaben' (1820); and 'Ueber das Besteuerungssystem' (1820).

Weismann, vis'män, August, German biologist: b. Frankfurt-on-the-Main 17 Jan. 1834. After studying medicine in Göttingen University he was clinical assistant at Rostock in 1856-7, and in the course of the three years 1858-60 visited Vienna, Italy, and Paris, devoting himself especially to studies in the natural sciences. He lived for a year at Schaumburg Castle as body physician to the Archduke Stephen of Austria, and in 1863 went to Giessen to prosecute his zoological studies under Leuckart. Having qualified as a lecturer in the University of Freiburg, he was appointed extraordinary professor there in 1866, and ordinary professor in 1873. His first published work was a treatise on the 'Development of the Diptera' (1864). It was followed by a work 'On the Influence of Isolation on the Formation of Species' (1872), and 'Studien zur Descendenztheorie' (1875-6). This work, translated into English, in 1882 by Prof. Meldola, under the title 'Studies in the Theory of Descent' (with a preface by Charles Darwin), treats of several important phenomena in natural history from the standpoint of a thorough believer in the doctrine of natural selection. His 'Beiträge zur Naturgeschichte der Daphnoiden' (1876-9) and 'Die Entstehung der Sexualzellen bei den Hydromedusen' (1883) are valuable contributions to the developmental aspect of zoology. A series of treatises followed, in which he developed his characteristic theories, among them being 'Ueber die Vererbung' ('On Heredity'), 'Ueber die Dauer des Lebens' ('On the Duration of Life'), 'Ueber Leben und Tod' ('On Life and Death'), 'Die Kontinuität des Keimplasmas als Grundlage einer Theorie der Vererbung' ('The Continuity of the Germ-Plasm as the Basis of a Theory of Heredity'), 'Die Bedeutung der sexuellen Fortpflanzung für die Selektionstheorie' ('The Significance of Sexual Reproduction for the Theory of Selection'), 'Ueber den Rückschritt in der Natur' ('On Retrograde Development in Nature'), and 'Amphimixis.' These have appeared in an English translation under the title 'Essays upon Heredity and Kindred Biological Problems' (Vol. I. 1889; Vol. II. 1892). Weismann's other works include: 'Das Keimplasma' (1892), in English as 'Germ Plasm' (1893); 'Die Allmacht der Naturzucht' ('The Omnipotence of Natural Selection', 1893); 'Aeusserer Einflüsse als Entwick-

elungsreize' ('External Influences as Stimuli to Development,' 1894); 'Neue Gedanken zur Vererbungsfrage' (Fresh Thoughts on the Question of Heredity,' 1895); and 'Ueber Germinalselektion' ('On Germinal Selection,' 1896). See HEREDITY; WEISMANNISM.

Weismannism, the essential teaching of August Weismann (q.v.), sometimes referred to as "Neo-Darwinism." Interest and controversy have gathered mainly round his answer to the question, "How is it that a single cell of the body can contain within itself all the hereditary tendencies of the whole organism?" In all theories of heredity (q.v.) biologists have assumed that characters acquired by the individual are transmitted to offspring. This Weismann denies, and while biologists have concerned themselves with speculation as to the mode by which such transmissions are effected, he challenges them to prove that they are effected at all. The burden of proof is thus thrown upon his opponents, whose assumptions must give way to experimental evidence, which alone can determine, and that only after protracted record of cases, whether individually acquired characters are transmitted or not. Death, he contends, is not a primary attribute of living matter; the protozoans, or one-celled organisms, being immortal in so far that they do not die naturally. The protozoan, a microscopic jelly-like, apparently — not really — structureless mass, with no seeming unlikeness of parts, multiplies by division. Each half becomes a complete individual, and grows in like manner as the whole to which it belonged, till it also divides, and so on with the multiplication of protozoans *ad infinitum*. It cannot be said of either half that one is parent and the other offspring, for both are of the same age, and only, in a limited sense, as the subdivisions into separate individuals are repeated, can we speak of succession of generations. In these processes there is nothing analogous to death. "There are," Weismann says, "no grounds for the assumption that the two halves of an amoeba are differently constituted internally, so that, after a time, one of them will die while the other continues to live. Observations show that when division is almost complete the protoplasm of both parts begins to circulate, and for some time passes backward and forward between the two halves. A complete mingling of the whole substance of the animal, and a resulting identity in the constitution of each half, is thus brought about before the final separation." Consequently, there is unlimited persistence of the individual; potential, although not absolute, immortality so long as life lasts on the earth.

While the one-celled organisms are thus immortal, only the reproductive cells of the metazoans, the many-celled, are immortal. How has this come about? Weismann accounts for it by the failure of certain protozoans to divide equally, whereby unlikeness of parts and differences of position of parts resulted. "The first multicellular organisms were probably clusters of similar cells, but these units soon lost the original homogeneity. As the result of mere relative position there arose division of labor, some of the cells were especially fitted to provide for the nutrition of the colony, while others undertook the work of reproduction." Clearly, those on the outside, being exposed to

the direct and constant action of their surroundings, would be the media of nutrition, and the builders-up of the cell-commonwealth. So the result of this cell-clustering would be that the cells fell into two classes, body cells and germ-cells. While the body cells were solely concerned with the nutrition of the organism, losing in this specialization of function the power of reproduction, that power became concentrated in the germ-cells, or, speaking more precisely, in the germ-plasm, which is located in the nucleus of the germ-cell. It is these germ-cells which are the immortal part of the metazoans. With increasing subdivision of function there has been increasing modification of the organism, but the two-fold classification of the somatic or body cells and the germ-cells has remained. The death of the body cells is involved in the ultimate failure to repair waste, because a worn-out tissue cannot forever renew itself, and because cell-division has its limits. In brief, death is the penalty paid for complexity of structure. As it is impossible for the germ-cell to be, as it were, an extract of the whole body, and for all the cells of the body to despatch particles to the germ-cells whence these derive their power of heredity (the fundamental idea of Darwin's theory of pangenesis, q.v.), the germ-cells, so far as their essential and characteristic substance is concerned, are not derived from the body of the individual, but directly from the parent germ-cell. Heredity, Weismann contends, is secured by the transference from one generation to another of a substance with a definite chemical and molecular constitution—in other words, by the "continuity of the germ-plasm." This germ-plasm (which, Weismann's critics argue, runs perilously near a metaphysical concept) is assumed to possess a highly complex but extremely stable structure, so stable "that it absorbs nourishment and grows enormously without the least change in its complex molecular structure." Of this germ-plasm it is further assumed that a small portion contained in the parent egg-cell is not used up in the construction of the body of the offspring, but is reserved unchanged for the formation of the germ-cells of the following generations. Only variations of the germ-plasm itself are inherited, and it is upon these variations that natural selection operates. Variations are due not to the influence of external condition nor to use or disuse of organs, but to sexual conjugation. This process combines two groups of hereditary tendencies derived from the mingled germ-plasms of the male and female parents, resulting in those individual differences which form the material from which new species are produced by the action of natural selection. Those differences multiply in geometrical ratio.

The sum of the matter is that natural selection (q.v.) is the dominant factor, that use and disuse of parts and the action of the environment count for nothing, or, at the most, for but a little. (See *USE AND DISUSE*.) Here and there Weismann makes concessions as to the modifying influences of body cells on the germ-cells, and as to the ultimate origin of hereditary individual differences in the direct action of surroundings, which are a partial surrender of his main contention as to the isolation of the germ-plasm. It is not easy to reconcile the theory of an insulated germ-plasm with

the ceaseless manufacture, secretion, and expulsion of germ-cells, the materials of which are derived from the materials nourishing the entire organism; nor with the subtle influence of the nervous system on the reproductive organs.

Perhaps the most serious difficulty in Weismann's theory is in the reconciliation of psychological evolution with the continuity of the germ-plasm. For the researches of Spencer, Balfour, and others have demonstrated that the nervous system had its origin in modifications of the primitive skin due to the direct action of the environment. Be this as it may, the wide-reaching sociological significance of the doctrine of heredity—which may be regarded as the physical correlate of determinism—gives an importance to the labors of Weismann that cannot be overrated, and makes urgent the record of extended observations on the lines already laid down by Galton.

Weiss, John, American clergyman: b. Boston 28 June 1818; d. there 9 March 1879. He was graduated at Harvard in 1837; in the winter of 1842-3 studied at Heidelberg, Germany; was graduated in the last named year at the Harvard Divinity School, and settled as minister of a Unitarian church in Watertown, Mass. His anti-slavery utterances having disturbed the harmony of his pastorate, he resigned, and in 1847 became minister of a Unitarian society in New Bedford, Mass., but was soon compelled by reason of ill health to retire. Again in 1859-70 he was minister of the Watertown church, from which he finally withdrew in order to pursue his literary work. He was one of the most brilliant of the New England reformers and transcendentalists, and his writings display a mind at once mystical and scientific, strongly rationalistic on religious subjects, but endowed with a fine poetic power of interpretation, which he applied to religious history and symbolism, as well as to questions of philosophy and life, to which he brought prophetic insight and fervor. His publications include: 'Æsthetic Prose' (1845), a translation of Schiller's philosophical and æsthetic essays; 'Life and Correspondence of Theodore Parker' (1864); 'American Religion' (1871); 'Wit, Humor, and Shakespeare' (1880); and 'The Immortal Life' (1880).

Weissenfels, vîs'sën-fêls, Germany, a town of Prussia, in the province of Saxony, on the Saale, 20 miles south of Halle, with manufactures of sugar, machinery, paper, porcelain, shoes, woolen fabrics, gold and silver articles, etc. It has a 17th century castle, and a church containing the remains of Gustavus Adolphus. Pop. (1900) 28,201.

WEITSPEKAN INDIANS — WELD

Weitspekan (wīt'spēk-an) **Indians** (from *Weitspek*, the name of one of their towns). A linguistic stock of North American Indians, comprising several small tribes collectively known as the Yurok, occupying the lower Klamath River in California from the mouth of the Trinity down. On the coast Weitspekan territory extends from Gold Bluff to about six miles above the mouth of the Klamath. The Chilula are an offshoot of the Weitspek, living to the south of them, on Redwood creek to a point about 20 miles inland, and from Gold Bluff to about midway between Little and Mad rivers.

Weitzel, vit'sēl, **Godfrey**, American military engineer: b. Cincinnati, Ohio, 1 Nov. 1835; d. Philadelphia, Pa., 19 March 1884. He was graduated from West Point in 1855, became assistant professor of engineering there in 1859, was promoted lieutenant in 1860, and appointed chief of engineers in the Department of the Gulf. He was engaged in the defense of Fort Pickens, April-September 1861, later in that year was chief of engineers in the Department of the Ohio, and he accompanied Butler's expedition to New Orleans in that capacity. He became brigadier-general of volunteers in 1862, successfully conducted the Lafourche campaign, and defeated the Confederates at the battle of Labadieville. He was transferred to the Army of the James in April 1864, as chief engineer, and engaged in constructing defenses of Bermuda Hundred and Deep Bottom. He participated in the actions in Swift's Creek, Drewry's Bluff, and in the siege of Fort Harrison, and in November 1864 he was promoted major-general. He was second in command in Butler's unsuccessful expedition against Fort Fisher, and in March and April he was in command of the troops north of the Appomattox, with which he took possession of Richmond on 3 April. He was brevetted major-general in the regular army in 1865 and assigned to command the Rio Grande district, Texas. In 1866 he was mustered out of the volunteer service, appointed major in the regular army in that year, and was subsequently engaged in river and harbor improvements. He was advanced to be lieutenant-colonel of engineers in 1882.

Welbeck Abbey, England, the seat of the Duke of Portland, in Nottinghamshire, three miles south of Worksop. It occupies the site of an old Premonstratensian abbey, and came into the possession of the Portland family by marriage in 1734. It stands in a park 10 miles in circumference, and is a stately Palladian edifice of mainly the 17th and 18th centuries, but was greatly enlarged about 1864 by the fifth duke, to whom it owes its semi-underground picture gallery, ball room, and riding-school, the last 385 feet long, 104 feet wide, and 51 feet high.

Welch, Ashbel, American civil engineer: b. Nelson, N. Y., 4 Dec. 1809; d. Lambertville, N. J., 25 Sept. 1882. He was engaged as an engineer on the Lehigh Canal in 1827; was made chief engineer of the Delaware and Raritan Canal in 1835, and afterward planned the route and constructed the Belvidere and Delaware Railroad. In 1862 he became manager of the Pennsylvania railroad lines in New Jersey, and subsequently was made president. He introduced the block system (q.v.) in railroading in the United States, and published papers on

economics and civil engineering. He was elected president of the American Society of Civil Engineers in 1881.

Welch, Philip Henry, American humorist: b. Angelica, N. Y., 1 March 1849; d. Brooklyn, N. Y., 24 Feb. 1889. From 1882 to 1884 he was attached to the staff of the Rochester *Post Express*, and then removing to New York was employed by the *Sun*. He was prominent among the humorous press writers of his time and was an able satirist. He published 'The Tailor-Made Girl' (1888); and 'Said in Fun' (1889).

Welch, William Henry, American pathologist: b. Norfolk, Conn., 8 April 1850. He was graduated from Yale in 1870 and from the College of Physicians and Surgeons in New York in 1875. He studied pathology abroad, becoming in 1878 demonstrator of anatomy at the Bellevue Hospital Medical College, New York. Since 1884 he has been a professor of pathology at Johns Hopkins University. He is an eminent authority on bacteriology and pathology and is the author of 'General Pathology of Fever' and numerous professional papers.

Welcker, vël'kēr, Friedrich Gottlieb, German archaeologist: b. Grunberg, Hesse, 4 Nov. 1784; d. Bonn, Rhenish Prussia, 17 Dec. 1868. He was educated at Giessen, and in 1806-9 was a tutor in the family of Wilhelm von Humboldt at Rome. In the last named year he accepted the chair of archaeology at Giessen and in 1816 became professor at Göttingen, a position he resigned in 1819 to accept the chair of archaeology at Bonn. Political troubles in 1832 caused his dismissal, but he was shortly afterward recalled and occupied the post until 1861 when he retired. As a classical scholar Welcker held high rank, his extensive writings on Greek art, history, and mythology are of great and lasting value, 'Die griechische Tragödie mit Rücksicht auf den epischen Cyclus geordnet' (3 vols., 1841) is perhaps his greatest work. He prepared editions of Alcman, Hipponax, Philostratus 'Imagines,' Theognis, Hesiod's 'Theogony,' and 'Kleine Schriften' (6 vols.). Among the most notable of his other works are: 'Aeschyleische Triologie' (1824); 'Der epische Cyclus' (1835-49); 'Alte Denkmäler' (1849-64); 'Griechische Götterlehre' (1863); etc. Consult: Kekulé, 'Das Leben Friedrich Gottlieb Welckers' (1880).

Weld, Theodore Dwight, American philanthropist and educator: b. Hampton, Conn., 23 Nov. 1803; d. Hyde Park, Mass., 3 Feb. 1895. He was the son of Ludovicus and Eliza (Clark) Weld, and of lineal descent from Jonathan Edwards. He entered Phillips-Andover Academy, but left school because of impaired sight. He was one of the 63 original founders of the American Anti-Slavery Society, and in 1833 was secretary of that society; and in 1830 he was agent of the Society to Promote Manual Labor in Schools. He entered Lane Theological Seminary, Cincinnati, Ohio, and taught colored youth evenings. He was conspicuous for unselfish charities and fair dealing, and did not hesitate to denounce slavery and the slave trade openly and publicly. He left the seminary when the trustees suppressed the local anti-slavery organization and began a course of lectures. He was repeatedly mobbed, but his commanding

WELDE — WELDING

presence and athletic attainments, as well as his fearless and wonderful eloquence, enforced respect; at Granville, Ohio, when advised that the church would be burned if he lectured as advertised, he informed the trustees that he would then speak from its foundations; to threatening letters he replied: "Come, but bring your own winding sheets, which I cannot supply"; six undisturbed lectures followed. At Painesville, Ohio, such was his eloquence that the leader of the mob kicked in the head of the bass drum with which he had thought to drown the speaker's voice. In 1836, his voice partially failed him, but he taught school and used his pen vigorously. In 1838 he married Angelina Emiline, daughter of Judge John Grimke, of South Carolina, who, having become a Quaker in 1835, emancipated her inherited slaves. He edited the American Anti-Slavery Society's publications in Washington, D. C., and was confidential adviser with Congressmen who favored abolition of slavery in the District. In 1854 he established a school at Englewood, N. J., for the joint education of white and black youth; in 1864 removed to Hyde Park, Mass., and aided in founding the Historical Society, the public library and the school system. He was one of the most intimate friends of the poet Whittier, and participated in the celebration of Whittier's 80th birthday, on which occasion Elizur Wright, a former secretary of the Anti-Slavery Society, and Arnold Buffum, who escorted Frederick Douglass to England, the only survivors of the famous 63 men of 1833, were present. In 1837 he published 'The Bible on Slavery' and 'Abolition of Slavery in the District of Columbia'; in 1839, 'American Slavery as It is from the Testimony of 1,000 Voices'; and in 1841, in London, 'Slavery and the Slave Trade in the United States.'

Of his eloquence, the late President Joseph F. Tuttle of Wabash College, Indiana, said: "He was the Thunderer of the West," and as late as 1863 Rev. S. J. May, of Syracuse, N. Y., wrote: "If Weld could only again take the platform, Wendell Phillips is his only possible rival in the cause of liberty."

The town of Hyde Park celebrated the centennial anniversary of Weld's birth in 1903, in their new library building in the Historical Society's apartment, which, in memoriam, bears the name "Weld Hall."

HENRY B. CARRINGTON,
Cor. Sec. Hyde Park Historical Society.

Welde, wëld, Thomas, American Puritan clergyman: b. England about 1590; d. there 23 March 1662. Graduated from Cambridge in 1613, he took orders in the English Church and was minister at Terling, Essex, 1624-31. Being there deprived of his living on account of his Puritan views, he came to New England, arriving in Boston 5 June 1632, and in July was ordained as the first minister of the church at Roxbury, becoming a colleague of John Eliot (q.v.) in the following November. At the trial of Anne Hutchinson (1637) he was one of her opponents and with John Eliot and Richard Mather engaged in preparing the version of the Psalms, commonly known as the 'Bay Psalm Book,' the actual title of which was 'The Book of Psalms faithfully translated into English Metre' (Cambridge, 1640), the first book printed in New England. Weld was sent with Hugh

Peters to England in 1641 as colonial agent, a position he filled till his dismissal in 1646. He was afterward pastor at Gateshead, England (1649), and in 1662 was driven from his living on account of his nonconformity. He published 'A Short Account of the Rise, Reign and Ruin of the Antinomians, Familists, and Libertines that Infected the Churches of New England' (1644). This controversial tract was answered by John Wheelwright (q.v.) in his 'Mercurius Americanus' (1645).

Welding is the intimate union produced between the surfaces of two pieces of malleable metal, when heated almost to fusion and hammered together. This union is so close that when two bars of metal are properly welded the place of junction is as strong, relatively to its thickness, as any other part of the bar. Practically, iron is the only metal welded. To weld bar iron to another piece of iron requires an intense white heat. See also **ELECTRIC WELDING**.

Welding, Electric. The heat of an electric arc may be employed in fusing or welding metals, or the heat given out in the body of metal acting as a resistance to the passage of a heavy current, without any arc or spark, may effect that result. The arc method appears to have been first employed by De Meritens in 1881. In this instance leaden pieces designed to be united in the form of storage battery plates were arranged together as an extended positive electrode, and an arc was drawn between them and a negative carbon rod manipulated by means of an operating handle. Part of the heat energy of the arc served to melt the lead and cause union of the adjacent pieces, but much the larger proportion of the energy escaped by radiation and convection. The electric arc was thus akin to a gas blowpipe as commonly used in lead-burning in the construction of tanks for the chemical industries. Following De Meritens, heating by electric arcs has been applied to the fusing and welding of metals, notably of iron and steel, by Bernardos and Olszewski, Coffin, and others. When, as in the Bernardos and Olszewski method, the carbon electrode is made positive to the work, carbon is transported through the arc and is likely to enter the metal undergoing the process, which constitutes the negative pole. This addition of carbon may render iron or steel hard and unworkable, and cause cracks to be formed during the cooling of the fused mass at the joint or filling. By the employment, instead of carbon, of an electrode of the same metal as that of the work, Slavenoff overcame this difficulty. The gradual melting of the metal electrode furnishes metal for forming joints, or for repairing or supplementing castings which are defective; such as those which are incomplete or contain blowholes. More recently the work is made the positive pole and this results in a greater proportion of the energy than formerly being expended in heating the metal undergoing the operation. Inasmuch as the conditions of energy supply for sustaining the arc, are but little different from those often found in the commercial operation of arc lamps from constant potential mains, arc welding may often be practised by connections made to such mains. A choking or steadying resistance is put in series with the fusing arc in a branch from direct current lines at a potential difference

WELDING

of 200 volts or thereabout. With work such as that to which the Bernardos and Olszewski method has been found to be applicable, the current in the arc may vary from 150 amperes up to 500 or more. The potential across the arc itself will generally be from 100 to 150 volts. With the metal electrode used by Slaviennoff the current needed will be greater and the arc potential less than the above amounts. It appears that in certain cases the current may even surpass 4,000 amperes.

While a moderate application of these arc processes for fusing and welding iron and steel has been made, the range of operations to which they are suited is somewhat limited and their success depends largely upon the skill of the workman. He must protect not only his eyesight from the glare of the large arc, but also the surface of his body, and must avoid the irritating vapors which arise there from the flame. At the same time vigorous ventilation can not be employed, for motion of the air tends to disturb the arc and render the work more difficult. A large proportion of the energy is radiated or carried off in the hot gases from the arc. To these energy losses must be added that due to the use of the steadying resistance for obtaining stability in the current of the arc. On the other hand the appliances needed for arc fusing or welding are simple and the source of current energy often conveniently found in existing electric circuits.

Werdermann, in 1874, proposed to deflect an electric arc formed between the usual carbons by a jet of air, forming thereby an electric blowpipe. More recently Zerener has in a similar way employed an arc deflected by a magnet as a sort of blowpipe for welding iron. In addition, the curious electric heating action first published by Hoho and Lagrange, has been proposed for welding metals. If a negative electrode of a direct current circuit having a potential of 100 to 150 volts, is of small surface relatively to that of the positive electrode when both are immersed in a liquid bath, such as a solution of potassium or sodium carbonate, the surface of such negative electrode, where immersed, glows with light, gas bubbles arise from it, and the electrode itself heats rapidly in spite of its immersion in cold liquid. A bar of iron used as the negative electrode, may thus be brought to incandescence and removed for welding, or it may even be melted under the liquid of the bath. The loss of heat in such a liquid heating process is necessarily somewhat great.

The Thomson process of electric welding, which differs radically from the arc heating operations above described, was first announced in 1886. It has since gone into extensive commercial use. No electric arc is employed, but the heat which effects the welding is solely due to the resistance of those parts of the metal pieces at the contact where they are to be welded together. This resistance is, of course, extremely low, and the delivery of sufficient energy for heating and welding is the result of the passage of relatively enormous currents. Their potential is only two or three volts, more or less. The metal pieces to be welded together are held respectively in massive clamps or vises of highly conducting metal such as copper, with a slight portion only of each piece projecting to form the joint. These projections of the pieces are brought together in firm contact, for which

purpose at least one of the clamps is made movable toward and from the other, both of them being mounted on a firm support. The pieces having been adjusted to meet in correct relation for the subsequent formation of the weld uniting them, an electric current sufficient in amount to heat the meeting portions of the pieces to the temperature at which they soften and unite, is passed from clamp to clamp, thus traversing the joint and the short projecting portions of the pieces between the clamps. So heavy is the current at command that a solid bar without break spanning the space between the clamps could be heated and melted. The completion of the weld after heating is effected by pressure exerted to force one clamp toward the other, which results in a slight upsetting or extrusion of metal at the weld called a burr. For copper a pressure of about 600 pounds per square inch of section is usual, while with iron it is 1,200 and with tool steel 1,800 pounds or more. Nearly all of the metals, even those like antimony and bismuth which are brittle and crystalline, may be united by this process, and many different metals and alloys joined one to another. In some cases, as with high carbon steels, a flux such as glass of borax, is employed to facilitate union at temperatures not high enough to burn or destroy the texture of the metal. Mild steel and iron welds are usually made, as in ordinary forges, at welding heat, or that which melts or fluxes the ordinary black oxide scale upon the metal. The heavy welding currents can not be conveyed without great loss to distances of even a few feet unless conductors of prohibitive section and cost be used. The welding clamps are in practice carried directly upon the secondary terminals of a special welding transformer. The Thomson welding transformer is a construction like a lighting transformer in which the usual secondary circuit of numerous turns is replaced by a very massive conductor constituting ordinarily only a single turn around the iron magnetic core. The primary or inducing circuit is similar to that of the ordinary transformer for alternating current and it is supplied from alternating current dynamos or lines as usual in such work. It will be seen that the secondary conductor is unique in character, being often a bar or casting of many square inches of section of copper of short length. The circuit of this single turn secondary is completed only by the meeting ends of the work pieces in the clamps. It will thus be evident that the chief resistance or opposition to the flow of the low voltage current in the single secondary turn will be at the proposed joint or weld between the clamps. Here it is then that the transformed energy is for the most part given out as heat, the section of metal which can be welded depending upon the scale of the apparatus used and the energy of the primary source which is available. The welding transformer has found convenient application in the heating of metal pieces for forging, bending, shaping, brazing or the like, in addition to welding. It has also in the Lemp process been divested of its welding clamps and applied to the local annealing of the hardened face of armor plates, so as to facilitate drilling and tapping, or cutting into desired shapes. The welds made by the Thomson process are usually butt welds, though lap welds are also made with almost equal facility. In butt welding there is of course an upset, burr, or

WELDON—WELDON AND SOUTH SIDE RAILROADS, RAID ON

extrusion of metal at the joint. In many cases this is not removed, and it renders the joint stronger than other adjacent sections. Oftentimes the joint is pressed or forged while still hot so as to remove the burr at the joint. In other cases the joint is finished by filing or grinding. The welding clamps are modified in form and disposition to suit the shape and size of the pieces to be held, and the pressure used to effect the weld is either manually applied by levers or is obtained from a strained spring, or again, in large work, by hydraulic means under control by suitable valves. The heating effects of the electric current are so perfectly adjusted by regulating appliances that most of the metals formerly regarded as unweldable, yield good results with the process. Even leaden pieces, such for example, as sections of lead pipe, may be joined together with great ease. The operation of the electric welder is characterized by uniformity, rapidity, flexibility, cleanliness, neatness, accuracy and economy. It has found extensive application to repetition work; single machines making sometimes as many as 2,000 welds per day of ten hours. It is used widely in the wagon and carriage industry for tires, axles, bands, fifth wheels, etc., and for wire bands for affixing rubber tires to wheels. Many parts of bicycles and automobiles are built up by electric welding. In the construction of tools and parts of machinery and particularly in the wire industry it plays an important part. Another important field is in the welding of wire or strip into hoops or bands for barrels, tubs, pails, etc. Machines are in operation producing electrically welded wire fencing, in which the wires which in the fence are horizontal are welded to verticals at intervals, the action somewhat resembling that of a loom. In joining pipe into continuous lengths or coils, and also in welding *in situ* street railway rails into a continuous track the electric weld possesses a special adaptability. An interesting application of the electric welder is found in the production of steel tubing by the progressive welding of a longitudinal seam. A long strip of flat sheet or *skelp* is rolled up so as to cause the lateral edges to meet. It then passes between welding rolls whereby the heating current locally traverses the meeting edges and welds them. The operation is progressive from one end of the pipe to the other as it is fed through the machine. The result is a pipe of uniform diameter with walls of even thickness, having a delicate bead along one side where the weld has been made. This bead is removed if the pipe be subsequently mandrel drawn with a reduction of its diameter. In the earlier electric welders the operations of clamping the pieces in place, applying and cutting off the electric current and exerting mechanical pressure, were usually manually controlled. Machines more or less automatic are now frequently employed. In recent types adapted for rapid repetition of work upon identical pieces, the action is entirely automatic; the machine runs continuously and its sequence of actions is definitely determined by its construction. These machines are power driven, movements being imparted for clamping the pieces as they are fed to the machine, for closing the current switch, for exerting pressure to complete the weld, for cutting off the current and for releasing the pieces from the clamps after the operation. In wire fence

and chain machines the stock is itself fed automatically and the welding continued until the machine is stopped or the material exhausted. The energy required to effect electric welds naturally varies with the size of the pieces and with the material. It also depends upon the time consumed in the work, which time may be made shorter or longer even with exactly similar pieces. The following table gives the results of some tests made upon different sections of iron, mild steel, brass and copper in the form of bars. The figures are only approximate and would vary considerably if the welds had been made in times different from those given. In general, working at a greater rapidity would lessen the total power used but require larger apparatus for the increased output required during the welding:

ENERGY USED IN ELECTRIC WELDING BY THE THOMSON PROCESS.

ELIHU THOMSON,
Electrical Expert and Inventor.

Weldon, N. C., a town in Halifax County, on the Roanoke River and the Seaboard Air Line and Atlantic Coast Line railways, 97 miles east of Raleigh. It is at the head of steam-boat navigation on the Roanoke. Here are located six churches, a state bank, a winery, several mills, and a weekly newspaper. There is excellent water-power. The surrounding region is an agricultural one. Pop. (1890) 1,286; (1900) 1,433.

Weldon and South Side Railroads, Wilson's Raid on. The first movement in the siege of Petersburg, June 1864, was to sever its railroad communication with the south and for this purpose Gen. Meade ordered Gen. J. H. Wilson to lead an expedition to destroy the roads, after which he was authorized to cross into North Carolina and make his way to the coast or to join Gen. Sherman in northern Georgia. When Wilson suggested a possibility that he might have to return northward, he was assured that the enemy's cavalry would be fully employed by Sheridan and that it was the intention for the Army of the Potomac immedi-

WELL — WELLAND CANAL

ately to cover the Weldon and South Side railroads, so that no infantry could be sent from Petersburg to bar his return. Wilson, at 3 o'clock on the morning of 22 June, moved from Mount Sinia church on the Blackwater to destroy the Petersburg and Lynchburg, and Richmond and Danville railroads, his objective point being Burkesville, the intersection of these roads. He had two brigades of his own division, and Gen. Kautz's division of four regiments, in all about 5,500 men with 16 guns. He crossed the Weldon Railroad at Reams' Station, destroying the station and some of the road, reached the Lynchburg road, near Ford's Station, about 14 miles from Petersburg, and destroyed it as far south as Burkesville, a distance of 30 miles, and then turned to and moved along the Danville road, destroying it to Staunton River, about 30 miles. The Confederate cavalry division of Gen. W. H. F. Lee had followed him closely, and near Nottoway Court House succeeded in interposing between his two divisions. At Staunton River Kautz found the bridge guarded by about 600 militia with artillery intrenched, which he attacked without success. At the same time W. H. F. Lee attacked Wilson's rear, and the latter, now nearly 100 miles from Petersburg, and having accomplished the object of his expedition and unable to go farther, determined to return. Marching at midnight, he moved eastward 80 miles, through Christianburg and Greensboro, crossing the Meherrin River, at Safford's bridge, and arriving at the Double Bridges of the Nottoway in the afternoon of the 28th. He was then ten miles west of Jarratt's Station of the Weldon Railroad. Ascertaining that but 1,000 Confederate cavalry and infantry held Stony Creek Depot, on the Weldon Railroad, ten miles northeast, he moved rapidly to cross the railroad two miles south of that point. Gen. Lee had been kept well informed of Wilson's movements and, to intercept his return, had sent Gen. Hampton, with his cavalry division, on the 27th to Stony Creek Depot, where he arrived at noon of the 28th, Fitzhugh Lee's division following as far as Reams' Station, ten miles north of Stony Creek and about the same distance south of Petersburg. When Wilson arrived at the crossing of the Stony Creek Depot and the Dinwiddie Court House roads, he was attacked by Hampton's outpost, the contest continuing until 10 P.M. Wilson now endeavored to evade Hampton by marching westward to the old stage road to Petersburg, thence entirely around him to reach the left of the Army of the Potomac. Kautz led the advance, but before Wilson could withdraw all of his own division, early in the morning of the 29th, he was attacked in flank and front by Hampton and driven back on the road to the Double Bridges, and his command much scattered, Hampton following two miles, then turning back to intercept him should he attempt to cross the Weldon Railroad at or near Reams' Station; but Wilson's main body had passed the stage road before Hampton reached it, who only struck Wilson's rear. Wilson reached Reams' Station at 9 A.M., where he found Kautz, who had preceded him two hours, and engaged Fitzhugh Lee's cavalry and some of Gen. Mahone's infantry intrenched. Wilson had expected to find the Weldon road held by the Army of the Potomac; and now, finding himself so nearly surrounded, he issued all his ammunition, de-

stroyed his wagons and caissons, and at noon began to move back by the Boydton road and Double Bridges to the south side of the Nottoway, intending, after crossing the river, to move eastward about 20 miles and then turn north again. But Fitzhugh Lee had moved his division past his left and two brigades of infantry, under Gen. Mahone, sent down the railroad from near Petersburg, attacked Wilson in front, Fitzhugh Lee attacked him in flank and rear, Kautz was cut off, and Wilson's whole rear was thrown into confusion. Kautz escaped, crossed the railroad near Reams' Station, and got within the lines of the Army of the Potomac, abandoning his artillery, and having 1,000 of Wilson's men with him, 500 of his own remaining with Wilson. At Stony Creek Wilson's rear was again attacked and thrown into some disorder; but pushing on, he crossed the Nottoway before midnight, and then moved eastward to Jarratt's Station, where he halted until daylight of the 30th, when he continued eastward, crossed the Nottoway again at Peter's bridge, rested five hours, and at 5.30 P.M. resumed the march for Blunt's bridge over the Blackwater. The bridge had been in great part destroyed, and the river was not fordable. A hard hour's work repaired the bridge, which was crossed and destroyed, just as Hampton and Fitzhugh Lee came up. The Confederates here ceased pursuit, and Wilson arrived at Light House Point, in the afternoon of 2 July. He had been gone ten days, had marched over 330 miles, and had destroyed more than 60 miles of railroad. His loss in both divisions was 240 killed and wounded, and 1,261 captured or missing; 12 field-guns and 4 mountain howitzers were abandoned; and all his wagons were burned or captured. Consult: 'Official Records,' Vol. XL; Humphreys, 'The Virginia Campaign of 1864-5.'

E. A. CARMAN.

Well, a natural flowing spring; excavations for water, which are among the most ancient permanent human constructions. The wells of the Sahara are square holes cut in the sand, beneath which, in most places, lies a continuous sheet of water at convenient distances for digging. The Greek and Roman wells were provided with a curb, long before well sweeps or pulleys were invented, as the deeply worn grooves in the curbs of ancient wells prove.

Welland Canal, Ontario, Canada, a ship canal extending from Port Colborne to Port Dalhousie, across the neck of land west of the Niagara River and Falls, and maintaining continuous navigation between Lake Erie and Lake Ontario. It traverses Welland County, and near Welland, the capital [pop. (1901) 1,863], the Welland or Chippewa River forms part of its course. The canal is 26¾ miles long, 14 feet deep, and surmounts a rise of 362¾ feet by 25 locks. It was begun in 1824 and was opened to travel in 1833. It was enlarged in 1871, and again in 1900, the total amount expended on its construction to 30 June 1900 amounting to \$24,293,587. The canal is open to navigation on an average about 240 days in the year; an average of 2,200 vessels, transporting 790,000 tons of freight, pass through annually; and the annual collection of tolls on freight, passenger, and vessels averages about \$225,000. See CANALS.

WELLDON — WELLESLEY COLLEGE

Well'don, James Edward Cowell, English prelate and educator: b. Tonbridge, Kent, 25 April 1854. He was educated at Cambridge, was head master of Dulwich College 1883, and of Harrow School, 1885-98. In the last named year he was appointed to the bishopric of Calcutta and as such was metropolitan of India. He resigned in 1902 and returned to England, where he was made canon of Westminster. Besides standard translations of Aristotle's 'Politics,' 'Rhetoric,' and 'Nicomachean Ethics,' he has published: 'Sermons Preached to Harrow Boys' (1887); 'The Spiritual Life and Other Sermons' (1888); 'The Hope of Immortality' (1898); 'The Revelation of the Holy Spirit' (1902).

Welle-Makwa, wël'lë-mäk'wä, Central Africa, the most important affluent of the Ubangi (q.v.), a tributary of the Kongo. Its source is on the western slope of Mount Emin Pasha, and after a course of about 400 miles through a fertile and rich country to the north and east of the Kongo, it flows into the Ubangi at Dayu, opposite Yakoma, at the confluence of two other headstreams. The identity of the Welle-Makwa, was uncertain for many years; explorers thought it was a different stream to the Ubangi, but their connection was fully established in 1888, and the river throughout its entire length is sometimes called the Welle-Makwa.

Wel'ler, Reginald Heber, American Protestant Episcopal bishop: b. Jefferson City, Mo., 6 Nov. 1857. He studied at the University of the South 1875-7, and was graduated from the Nashotah Theological Seminary, Wisconsin, in 1884. Ordained to the priesthood in the last named year he was rector of Eau Claire, Wis., 1884-8; of Waukesha, Wis., 1888-90; and of Stevens Point, Wis., 1890-1900. He was consecrated bishop-coadjutor of Fond du Lac in November 1900, the somewhat spectacular ceremonial practised on this occasion calling forth more or less criticism.

Welles, wëlz, **Gideon**, American statesman: b. Glastonbury, Conn., 1 July 1802; d. Hartford, Conn., 11 Feb. 1878. He studied at Norwich University, Vt., but did not complete the course there, and for a time turned his attention to the study of law. In 1826, however, he entered journalism as editor of the Hartford *Times*, which under his management became one of the leading Democratic papers of the State. He was one of the first publicly to advocate Andrew Jackson's election to the presidency, and always warmly supported him. In 1827-35 he was a member of the Connecticut legislature, and both as legislator and editor advocated the abolition of imprisonment for debt, opposed the practice of special legislation, and succeeded in obtaining the passage of general laws for the incorporation of business corporations. In 1836 he resigned the editorship of the *Times*, but continued to write for that paper. In 1835, 1842, and 1843 he was chosen State comptroller; in 1836-41 he was postmaster of Hartford; and in 1846 was appointed chief of the bureau of provisions and clothing in the Navy Department, which office he held till 1849. He had always been opposed to the extension of slave territory, and on the organization of the Republican party in 1855, became identified with it, and was Republican

candidate for governor of Connecticut in 1856; and a member of the national committee. In 1861 he was appointed secretary of the navy, and conducted the affairs of his department with marked executive ability throughout the Civil War; he continued in office under President Johnson till 1869. He was later affiliated with the Liberal Republicans, and in 1876 was a supporter of Tilden. He wrote 'Lincoln and Seward' (1874).

Wellesley, wëlz'li, **Arthur**. See WELLINGTON, ARTHUR WELLESLEY, DUKE OF.

Wellesley, Richard Colley, VISCOUNT AND MARQUIS, British statesman: b. Dublin 20 June 1760; d. London 26 Sept. 1842. He was educated at Oxford and on his majority took his seat as Earl of Mornington in the Irish House of Peers. Three years after he was returned to the British House of Commons as member for Beeralston and afterward sat for Windsor (1787-96), and for Old Sarum (1796-7). He was appointed governor-general of India in 1797, and in 1799 created Marquis Wellesley in the Irish peerage. His administration, both for its ability and the large accessions of territory made under it by the conquest of Mysor and the humbling of the Mahrattas, and in 1809 became foreign secretary under Mr. Perceval. In 1812 he resigned his place chiefly because he was in favor of Catholic emancipation, and did not return to office till 1821, when he became lord-lieutenant of Ireland. This post he retained till 1825, when he was removed from it by his brother, the Duke of Wellington, who was an opponent of emancipation and had become prime minister. In the Grey ministry he held the office of lord-steward till 1833, when he again became lord-lieutenant of Ireland. Displaced in the following year by the Peel ministry, he afterward held the office of lord-chamberlain for a few months of 1835. Consult: Martin, 'Indian Despatches, Minutes, and Correspondence of the Marquis Wellesley' (1836-7), and biographies by Torrens (1880), Malleon (1889), and Hutton (1893).

Wellesley, Mass., town in Norfolk County; on the Boston & Albany Railroad, 14 miles west of Boston. It was incorporated as a town in 1881, and includes the villages of Wellesley, Wellesley Hills, and Wellesley Farms. It is principally a residential town, with many broad streets and handsome residences. It is the seat of Wellesley College (q.v.), and also of Dana Hall, a secondary school for girls; Wellesley School, and Rock Ridge Hall, secondary schools for boys; and two Roman Catholic academies, the Academy of the Assumption for girls, and Saint Joseph's Academy for boys. There is also a public high school at Wellesley Hills, founded in 1865, and a public library of about 12,000 volumes (1904). The government is vested in the town-meeting and the selectmen, chosen annually. The water-works are owned and operated by the town. Pop. (1890) 3,600; (1900) 5,072.

Wellesley College, a college for women located at Wellesley, Mass. It was founded by Henry F. Durant to give "to young women opportunities for education equivalent to those usually provided in colleges for young men." The charter was obtained in 1870, and the college first opened to students in 1875. It is non-sectarian in control; three representatives

WELLESLEY ISLANDS — WELLINGTON

of the alumnae serve on the board of trustees. In 1888-94 the system of elective courses was established which is still in force. The college confers one baccalaureate degree, A.B., and the graduate degree, A.M. Certain courses are required in mathematics, philosophy, physiology, Bible history, English, some foreign language, and natural sciences; in addition to the required studies every candidate for the degree must take a sufficient amount of elective work to complete the equivalent of 57 one-hour courses, a one-hour course being a course given once a week for one year; before 1905 the requirement was 59 one-hour courses. Of these electives 18 one-hour courses must be taken in one of the following ways: 9 in each of two subjects, related or unrelated; 9 in one subject with 9 divided between two tributary subjects; 12 in one subject with 6 in a tributary subject; 12 in one subject with 6 divided between two tributary subjects. Pedagogical courses are offered in the history and science of education and in methods of teaching; art and music are included in the curriculum; the courses in history and theory in both departments count toward the degree; studio work in art counts toward the degree after one course in history is completed; the regular practical work in music does not count toward a degree. A full course in music leading to the certificate of the department may be taken by candidates for the A.B. degree who remain at the college five years. The college contributes toward the support of the American School of Classical Studies in Athens, the American School of Classical Studies in Rome, the Marine Biological Laboratory at Wood's Holl, and the women's table at the Zoological Station at Naples. There are 44 scholarships for undergraduates and one graduate fellowship. The students maintain literary and dramatic societies and a number of the Greek letter societies. The campus has a particularly beautiful situation within the limits of the town; it includes a lake which affords excellent opportunity for rowing and skating; on this lake is held the annual "Float." The buildings include College Hall, the Farnsworth Art Building, the observatory, Houghton Memorial Chapel, and the residence halls or "cottages" for students. In 1903 an addition to the endowment of \$150,000 was raised to offset the gift from John D. Rockefeller of a central heating plant; the productive funds amount to \$836,342 (in 1904). The library contains 54,813 volumes, including the Gertrude Memorial Library, the Library of American Linguistics, and other special and departmental libraries. The students in 1904 numbered 981, and the faculty 85; about 42 per cent of the graduates have become teachers.

Wellesley Islands, Australia, in the Gulf of Carpentaria, are politically attached to Queensland. Mornington, the northernmost and largest island, is 40 miles long by 15 miles broad.

Wellhausen, vĕl'how-zĕn, Julius, German Orientalist and Biblical scholar: b. Hameln, Hanover, 17 May 1844. He studied theology in the University of Göttingen, in 1872 was appointed professor of theology in Greifswald University, but resigned in 1882 because he could no longer hold the accepted views of Scriptural inspiration. He went to Halle as extraordinary

professor of Oriental languages, and in 1885 was appointed to an ordinary professorship at Marburg, whence in 1892 he removed to Göttingen to occupy a similar post. In 1871 he published a text-critical work on the books of Samuel, and in 1874 appeared his treatise 'Die Pharisäer und die Sadducäer.' The first volume of a 'Geschichte Israels' was issued in 1878, and a second edition of it in 1883, under the title, 'Prolegomena zur Geschichte Israels' (5th ed., 1899). The 'Prolegomena' was translated into English in 1885 by Black and Menzies, with a preface by W. Robertson Smith, the volume containing also a reprint of his article 'Israel' contributed to the 'Encyclopædia Britannica' (9th edition). The last-mentioned article was published separately in 1881 as a 'Sketch of the History of Israel and Judah' (3d ed., 1891), and included in a German form, as an 'Abriss der Geschichte Israels und Judas,' in the 1st volume of his 'Skizzen und Vorarbeiten' (1884-92). More recently the 'Abriss' has been amplified to form a work on 'Israelitische und Jüdische Geschichte' (1894; 4th ed. 1901). His masterly treatise on 'Die Composition des Hexateuchs und der historischen Bücher des Alten Testaments' (1885; 3d ed. 1899) originally appeared in the 'Jahrbücher für deutsche Theologie' (1876-7). Later works are: 'Muhammed in Medina' (1882); 'Der arabische Jospipus' (1897); 'Reste arabischen Heidentums' (2d ed. 1897), first published in the 'Skizzen und Vorarbeiten'; 'Die Kleinen Propheten übersetzt, mit Noten' (1892; 3d ed. 1898); 'Das Evangelium Marci' (1903).

Well'ing, James Clarke, American educator: b. Trenton, N. J., 14 July 1825; d. Hartford, Conn., 4 Sept. 1894. He was graduated from Princeton in 1844, was appointed associate principal in the New York Collegiate School in 1848, and in 1850-65 was literary editor of the Washington 'National Intelligencer.' He was clerk of the United States court of claims in 1862-7, in 1867-70 was president of Saint John's College, Annapolis, Md.; occupied the chair of belles-lettres at Princeton in 1870-1; and in 1871-94 was president of Columbian University, Washington, D. C. He was a regent of the Smithsonian Institution, president of the Corcoran Gallery of Art, and also of the Philosophical and the Anthropological Societies of Washington.

Well'ington, Arthur Wellesley, DUKE OF, British soldier and statesman: b. 1769; d. Walmer Castle, England, 14 Sept. 1852. He was the fourth son of the 1st Earl of Mornington. His mother was the eldest daughter of the 1st Viscount Dungannon. He was educated at Eton, privately at Brussels, and finally at the Military College of Angers. On 7 March 1787 he received a commission as ensign in the 73d Foot. He was gazetted under the name of Wesley, the family name till changed by his brother to Wellesley. After a rapid series of changes and promotions he attained by purchase in September 1793 the command as lieutenant-colonel of the 33d Regiment, in which he had attained his majority in April of the same year. In 1790 he was returned to the Irish Parliament for the family borough of Trim, in the country of Meath. In May 1794 he sailed with his regiment for Flanders to join the army of the Duke of York. In 1796 he joined his regiment at the

WELLINGTON

Cape, arrived at Calcutta in February 1797, and was attached to the Bengal service. Later the 33d Regiment was attached to the Nizam's contingent in the Deccan with Wellesley in command. The army entered Mysore in March 1799. An engagement took place at Mallavelly on the 27th, in which Wellesley, who commanded the left wing, turned the right of the enemy. He was subsequently employed to dislodge the enemy from their posts in front of Seringapatam, and after the capture of that capital was appointed, July 1799, to its command. During his administration he was compelled to take up arms against Dhundiah Waugh, a robber chief, who styled himself "King of the Two Worlds." Wellesley overtook and routed him with a small body of cavalry 10 Sept. 1800. In April 1802 Wellesley attained the rank of major-general. Early in 1803 he was appointed to the command of a force destined to restore the Peishwa of the Mahrattas, driven from his capital by Holkar. This operation successfully performed, the other Mahratta chiefs, Scindiah and the Raja of Berar, showed hostile designs against the British, and Wellesley was appointed to the chief military and political command in the operations against them. After an active campaign, in which he took Ahmednagar and Arungabad, he encountered a powerful Mahratta army, assisted by French officers, at Assaye (23 September) and entirely defeated it. The parallel successes of General Lake, and the defeat of the Raja of Berar by Wellesley at Argaum on 29 November, compelled the submission of the Mahrattas, and peace was restored on conditions drawn up by the successful general. The fame of Wellesley's achievements had now spread over India. Before leaving Madras he received his appointment as K.C.B. and the thanks of both houses of Parliament. He sailed for England on 10 March 1805 and arrived in September.

On 10 April 1806 Wellesley married Lady Catherine Pakenham, third daughter of the Earl of Longford. He had previously been elected and distinguished himself in the House of Commons by the defense of his brother's administration in India. In April 1807 he was appointed chief secretary for Ireland, and in August received the command of the reserve in the expedition to Copenhagen under Lord Cathcart and Admiral Gambier. He took Kioge 29 April, the only land operation of importance. On returning he resumed his duties as secretary, and received the thanks of Parliament for his share in the expedition. On 25 April 1808 he attained the rank of lieutenant-general.

In June Wellesley received the command of a force destined to operate in the north of Spain and Portugal in aid of the revolt against Napoleon. On 30 July he anchored in Mondego Bay, and landed his troops at Figueira. The English began their southward march on 8 August. Wellesley moved on the coast road to Torres Vedras. At Roliça he encountered about 5,000 men under Delaborde, whom Junot had sent in advance to arrest his progress. This corps, after a spirited resistance, was driven back and retired to Torres Vedras. Wellesley now drew nearer the coast, reaching Vimeiro on the 19th, where he was reinforced by two brigades from England, raising his force to 17,000. At the same time he was superseded in the command. The government had determined

to increase their army in the Peninsula, and had appointed Sir Hew Dalrymple to the chief command, with Sir Harry Burrard as second, and Wellesley, Moore, Hope, Paget, and Fraser as divisional commanders. Junot determined to attack the English on the land side while they were in the immediate neighborhood of the sea. The attack was made on 21 August, and Junot was beaten. After the battle Junot proposed an armistice, the result of which was the famous Convention of Cintra, by which the French agreed to evacuate Portugal on condition of being conveyed to France with their arms and baggage. Public feeling in England over the excessive liberality of the terms ran so high that the generals were recalled to be examined by a board of inquiry, but their conduct was approved of and commended. Wellesley proceeded to Ireland in December as chief secretary, and early in 1809 received the thanks of both houses of Parliament for his conduct of the campaign.

In the latter part of 1808 Napoleon overran Spain with 200,000 men, and Sir John Moore, pursued by Soult, carried the British army to Coruña, where it embarked for England. Lisbon was still held by Sir John Cradock, and a British force occupied Cadiz, when Wellesley was appointed to assume the chief command in the Peninsula. He arrived at Lisbon 22 April 1809. He advanced against Soult at Oporto, and the French were thrown into confusion and retreated precipitately. Soult now retired to Galicia, followed by Wellesley to the frontiers of Portugal, and harassed by the insurgent Portuguese. The Peninsula was at this time occupied by about 250,000 French troops; but after the departure of Napoleon the independence or insubordination of the French marshals prevented effective co-operation of the different armies, and the French command never extended beyond the districts occupied by their armies. The British commander had a series of difficulties to contend with. First was the smallness of the armies on which he could rely. The numbers of the British were always comparatively insignificant, and reinforcements were slowly and scantily supplied. Almost as formidable was the difficulty of co-operating with his allies. Spain and Portugal were without regular governments. The Portuguese officers even had mostly fled to Brazil, but the Portuguese troops, carefully drilled by Beresford and placed under the command of British officers, soon became a tractable and efficient force. It was far otherwise with the Spaniards. The junta and the generals were alike ignorant, incompetent, and self-conceited, and with the raw levies which constituted the Spanish armies it was positively dangerous to co-operate. Even with the Portuguese government Wellington had natural but formidable difficulties to contend with. The subsistence of the armies was a constant source of danger and embarrassment both in Spain and Portugal. The resources of the country were oppressed by the armies of three nations. The French took all they wanted and wasted much more. The Spanish armies, numerous and inefficient, were a sufficient weight for the junta, which always supplied with reluctance the wants of the British, who had commonly much greater difficulty in procuring provisions for money than either of the other armies had in seizing them.

WELLINGTON

Through all these difficulties Wellington adhered with undeviating patience and constancy to the strict principles of discipline he had laid down. He remonstrated with herculean labor, and with admirable spirit, as his despatches show, with authorities of all kinds; but he never under the great temptation took, or suffered others to take, violent means to supply his most pressing wants.

By a misunderstanding between Soult, who held the command in the north of Spain, and Ney, who was under him, Galicia was evacuated by both marshals, and never afterward recovered, a valuable result of Wellesley's first campaign. To co-operate with the Spanish armies, Wellesley had determined to advance into Spain, which he did in July by the north of the Tagus. Nearly every important fortress in Spain was in the hands of the French.

The victory of Talavera, 27-28 July, earned Wellesley the titles of Baron Douro and Viscount Wellington. Next day the French retreated across the Alberche, and broke up their army. The first invasion of Spain had resulted in nothing but a series of movements among the French troops. Wellington at this time surveyed the lines of Torres Vedras, and formed his plan of fortifications for their defense. Anticipating that invasion would come from the north, he left General Hill to guard the Tagus, and fixed his headquarters at Viscu.

The French in the meantime were largely reinforced. Soult was in Andalusia with 60,000 men threatening the south of Portugal, while in the north the army of Portugal was concentrating to the extent of 70,000 to 80,000, and the veteran Masséna was appointed to command it. Wellington was able to bring into the field from 50,000 to 60,000 British and Portuguese troops. The French invested the Spanish fortress of Ciudad Rodrigo early in June, and took it on 10 July. They then advanced to the Coa, from which the British retired. Almeida was captured on 27 August. Wellington fell back on the valley of the Mondego. In the middle of September Masséna began his march down the right bank of the river. At the Sierra de Busaco, a high ridge in front of Coimbra, Wellington made a stand and repulsed the French. After the battle Masséna turned Wellington's position, who retreated to Leiria, where he halted two days. On 8 October he entered his lines, just as the autumnal rains were beginning to fall. A powerful fleet and a flotilla of gunboats on the Tagus contributed to their defense. Masséna was wholly unprepared for his reception, and after some vain demonstrations he retired from their front. The Portuguese parties had cut off his communications with Spain, and sickness was rapidly diminishing his numbers. On 15 November he fell back to Santarém. Napoleon recommended to waste the English with continual engagements of advanced guards, and sent Soult instructions to co-operate with Masséna. But Soult, with the blockade of Cadiz and with the Spaniards on his hands, could only spare a sufficient force to besiege Badajoz. In March 1811 Masséna was compelled to begin his retreat, which he conducted with great skill. The French crossed the Agueda on 6 April. Wellington estimated their loss in the campaign at not less than 45,000. Wellington blockaded Almeida, and cantoning his army between the Coa and the Agueda, returned to Badajoz, which

had been taken by Soult and invested by Beresford. He was speedily recalled by an aggressive movement of Masséna to relieve Almeida. Wellington took up a position to cover the fortress at Fuentes de Onoro, where he was attacked by Masséna with a superior force. In this battle he performed the exceedingly critical operation of changing his front in presence of the enemy. The maneuver was successful, and Masséna was repulsed. Almeida surrendered a few days after the battle, and Masséna was about the same time superseded by Marmont. Soult in the meantime had been defeated by Beresford at Albuera in an attempt to relieve Badajoz. Wellington returned to prosecute the siege, and Marmont also moved south to join Soult, but afterward returned to Salamanca. This induced Wellington to push the siege of Ciudad Rodrigo in preference to that of Badajoz, and he returned to the Agueda. Marmont, however, advanced with a superior force, and he withdrew to the Coa. Marmont returned to Salamanca.

During the winter Wellington continued to occupy himself with preparations for this siege, collecting his stores at Almeida under pretext of repairing it. On 6 Jan. 1812, he moved his headquarters to Gallegos, invested Ciudad Rodrigo on the 8th, and took it by assault on the 12th. An earldom, a pension, and a Spanish dukedom rewarded this achievement. Wellington now went south with his principal force to take Badajoz; and Marmont, who had collected his forces to raise the siege of Ciudad Rodrigo, invaded Portugal by Salugal, and ravaged the country. Badajoz was taken on 6 April, with a heavy loss. Having secured the frontier fortresses Wellington determined again to invade Spain. Leaving Hill on the southern frontier he moved north with his main army, and on 17 June reached Salamanca, Marmont retiring to Toro. The French general, when he had concentrated his forces, attempted by a series of pretentious maneuvers to surprise the British commander, his ultimate object being to cut him off from his communications. With this purpose he crossed the Tormes followed by Wellington, who took up his position between the river and two hills called the Arapiles. Here Marmont's overdisplay of tactics recoiled on himself. Having gained the outer Arapile, in extending his left to attack the British right he gave Wellington the opportunity he had long desired of attacking him. Marmont was wounded, and the French left and centre broken. Clausel, who attempted to re-form the army, was routed. Numerous prisoners were taken by the cavalry in pursuit, and the French retired to Burgos. Wellington reached Valladolid on 31 July, and turning on Joseph, who had advanced to support Marmont, followed him to Madrid, which he entered on 12 August. Hill was now advancing to join Wellington, and Joseph fell back from Toledo to Almansa in Murcia. These successes compelled Soult to abandon Andalusia, and an Anglo-Spanish force from Cadiz took Seville. Wellington's next movement was against the army he had defeated under Clausel, which had been largely reinforced. He left Hill in Madrid (1 September), and advanced to Burgos, being joined on his way by a body of Spaniards. The French retired, leaving a garrison in the castle, which Wellington deemed it necessary to take before advancing. The siege, for want of proper artillery, occupied him till 21 October. In the

WELLINGTON

meantime the northern army under Souham was again advancing, and Soult with a powerful army marching on Madrid, which Hill had abandoned to fall back on Salamanca. Wellington abandoned the siege and retreated, closely followed by the French, who repeatedly attacked his rear. At Palencia he was joined by a brigade from England. At Tudela Souham halted to wait for Soult, and Wellington proceeded to the Tormes, where he was joined by Hill, and when the French crossed the Tormes in force he took up his old position at the Arapiles. The united armies of Soult and Souham amounted to nearly 90,000 men. Wellington's strength was over 50,000. The enemy, instead of attacking, threatened his communications, upon which he retreated to the Agueda, and established his headquarters at Ciudad Rodrigo. The French, not being prepared to invade Portugal, withdrew their armies to cantonments in Castile. General Hill's corps continued to occupy Estremadura, and the rest of the British were cantoned on the Portuguese frontier.

The gains of this campaign were substantial. The French had not only been compelled to reinforce their Spanish armies largely at the expense of their operations elsewhere, but had lost Andalusia, and given the British a footing in Estremadura. Wellington received (18 August) the title of marquis, and Parliament voted him thanks and £100,000. The failure of the Russian campaign compelled Napoleon to recall Soult from Spain, and Wellington was able to open the campaign of 1813 with a force of 70,000 British and Portuguese. He had also been appointed commander-in-chief of the Spanish armies. He opened the campaign in May by an advance in the former direction, and on 12 June reached Burgos, the French retreating to the Ebro. Wellington turned their position by crossing the Ebro near its source, and after some unsuccessful fighting they fell back on Vittoria. In a strong position commanding the principal roads through the town they were defeated by the British on 21 June. Being driven from the town, while the British left had seized the Bayonne road, by which they retreated, they were thrown into confusion and routed. Wellington now occupied the passes of the Pyrenees, and besieged Pampeluna and San Sebastian. He was created field-marshal and received the Spanish title of Duke of Vittoria. Soult was despatched by Napoleon, with the title of lieutenant of the emperor, to restore matters in the Peninsula. He had still a powerful army (80,000), but after a series of engagements, called the battles of the Pyrenees, he retreated into France. Some time being spent in pushing the sieges of Pampeluna and San Sebastian, the former of which surrendered 31 August, the latter 31 October, Wellington crossed the Bidassoa in October, and in November the whole army descended from the Pyrenees into the French plains. Some severe fighting occurred before the armies went into winter cantonments. On 27 February Wellington defeated Soult at Orthez, and the French retreated to Toulouse. Suchet had abandoned Catalonia, and reached Narbonne. Another engagement took place in front of Toulouse on 10 April, in which the French after severe fighting were driven into the town. Next day Soult evacuated Toulouse, and Wellington entered it on the 12th. In the afternoon news arrived of Napoleon's abdication, but Soult declined to sub-

mit to the provisional government without further advice, and Wellington refused an armistice. Advices having arrived from Berthier, Soult entered into a convention on 18, and Suchet on 19 April. In a sortie of the garrison of Bayonne, before the peace was known, the British suffered severely. On 30 April Wellington, leaving his army in quarters, set out for Paris. In May he had to visit Madrid to allay political differences among the Spanish generals, and on 14 June he issued farewell orders to his army. He was created Marquis of Douro and Duke of Wellington in May, with an annuity of £13,000, commutable for £300,000, afterward £400,000. He received the thanks of both houses of Parliament. In July he went as ambassador to France, and he succeeded Lord Castlereagh as British representative in the Congress of Vienna. In April he took the command of the army assembled in the Netherlands to oppose Napoleon. (See FRANCE; NAPOLEON I.; WATERLOO.) On his return to England after the restoration of peace he received a vote of £200,000 for the purchase of the estate of Strathfieldsaye, to be held on presenting a colored flag at Windsor on 18 June each year. Numerous foreign honors were showered upon him; among others he was made field-marshal of the armies of France, Russia, Austria, and Prussia.

With the return of peace he resumed the career of politics. He accepted the post of master-general of the ordnance with a seat in the cabinet of Lord Liverpool in January 1819. In 1822 he represented Great Britain in the Congress of Vienna. In 1826 he was appointed high-constable of the Tower, and went to Saint Petersburg as ambassador on the affairs of Greece. On 22 Jan. 1827 he succeeded the Duke of York as commander-in-chief of the forces. On the accession of Canning to office (April 1828) he set the bad example of resigning this post on political grounds. He resumed it again on the accession of Lord Goderich. On 8 Jan. 1828 he accepted the premiership and, resigning the command of the forces, gave it to Lord Hill. During his first year of office he carried the repeal of the Test and Corporation Acts. In January 1829 he was appointed governor of Dover Castle and lord warden of the Cinque Ports. This year he carried the Catholic Emancipation Bill. Both this and the repeal of tests were reforms which he had steadfastly opposed, and which he yielded to necessity rather than conviction. He fought a duel in defense of his conduct on this bill with Lord Winchilsea on 21 March. In 1830 repeated motions for parliamentary reform were defeated, but the growing discontent throughout the country on this subject and a defeat in Parliament caused the resignation of the government in November. His opposition to reform made the duke so unpopular that he was assaulted by a mob on 18 June 1832, and his life endangered. He accepted the office of foreign secretary under Sir Robert Peel, 9 Dec. 1834, and retired with him, 8 April 1835. In the Peel ministry in 1841 he took a seat in the cabinet without office. On 10 Dec. 1842, on the death of Lord Hill, he resumed the command of the forces, which he held till his death. On the return of Peel to office in 1846 he supported him in carrying the repeal of the corn-laws, which up till then he had opposed. From this time his general policy in Parliament was to support the government of the day.

Wellington, Chile, an island off the west coast of Magallanes Territory, 138 miles long and 35 miles wide. Its northernmost extremity is Cape San Roman.

Wellington, Kan., city, county-seat of Sumner County; on the Slate Creek, and on the Atchison, T. & S. F. and the Chicago, R. I. & Pacific R.R.'s; about 30 miles south of Wichita and 150 miles southwest of Topeka. It is in an agricultural and stock-raising region. The industries of the city are chiefly connected with farm products and shipment of live-stock. It has three banks, having a combined capital of \$125,000, and (1903) deposits amounting to \$847,570. Pop. (1890) 4,391; (1900) 4,245.

Wellington, New Zealand, (1) The capital city of New Zealand, and also of the provincial district of Wellington, situated on Lambton Harbor, on the southwest of Port Nicholson, an inlet of Cook Strait, about 1,200 miles southeast of Sydney in Australia. Its fine harbor is the safest and most commodious in New Zealand. The principal buildings and institutions are: Government House, a fine building in Italian style, in its own grounds; the houses of legislature, including a parliamentary library building; the government building; the supreme court edifice; Anglican, Roman Catholic, Wesleyan, Primitive Methodist, Presbyterian, Congregational, and other churches; a free public library; Wellington College, a girls' high school, Saint Patrick's College (R. C.), a technical school, and other similar educational institutions; Victoria University College, affiliated to the University of New Zealand; a general hospital; a lunatic asylum; the Boys' Institute; and the botanical gardens. The city is lighted by electricity, and has a good water supply, and its streets are traversed by electric tramways. The chief industrial establishments are tanneries, candle and soap works, coffee-mills, boot factories, biscuit works, foundries, brick-works, saw-mills, woolen-mills, breweries, and meat-preserving works. The town has a patent slip, and has been fortified. Pop. (1901) 43,638, including suburbs, 49,344. (2) A provincial district in the south of North Island, area about 11,000 square miles. Its coast is but little indented, the principal openings being Palliser Bay and Port Nicholson in the south. It is traversed throughout almost its whole length by a range of mountains, averaging about 4,000 feet in height. Parallel to this main range, and nearer the east coast, there is a series of lower ranges,

and between these two chief mountain-systems extends the broad Wairarapa Plain, merging northward into an undulating country. A considerable extent of fairly level country, increasing in breadth northward, is also found along the west coast. The district is well watered by several rivers and in the south are Lakes Wairarapa and Onoke. Wellington is well wooded, and timber is one of its chief exports. Much of the surface is admirably adapted for pastoral purposes, and there are now in the district over 4,000,000 sheep, in addition to large numbers of cattle and horses. Agriculture is also successfully carried on in several parts, the principal crops being oats, wheat, potatoes, and turnips. The number of cheese and butter factories is steadily increasing. Little mineral wealth has been found in the district of Wellington, but some gold has been worked. The chief town is Wellington, the capital of the colony. Railways run from Wellington to Napier and New Plymouth. Pop. (1901) 141,354.

Wellington, Ohio, village in Lorain County; on the Wheeling & L. E., and the Cleveland, C. C. & St. L. R.R.'s; about 35 miles southwest of Cleveland. It is the commercial centre of a farm and dairy section. It is noted for its large annual shipments of cheese. It has flour mills, lumber mills, a foundry, and in the vicinity are a number of butter and cheese factories. The two banks have a combined capital of \$75,000 and deposits amounting to \$520,000. Pop. (1890) 2,069; (1900) 2,094.

Wellington College, England, in Berkshire, four miles south-southeast of Wokingham, was founded in 1853, in memory of the Duke of Wellington, by public subscription. The foundation stone was laid by Queen Victoria in 1856, and it was opened by her in 1859. It has 90 scholarships for the sons of deceased army officers, 12 exhibitions, 7 open scholarships, and over 400 pupils.

Wellingtonia Gigan'tea, the name at first used for the *Sequoia gigantea*. See SEQUOIA.

Well'man, Walter, American journalist and explorer: b. Mentor, Ohio, 3 Nov. 1858. He obtained a secondary education in Michigan, in 1879 established the *Evening Post* of Cincinnati, and from 1884 was political and Washington correspondent of the *Chicago Herald and Record-Herald*. In 1892, after investigation of the subject, he located the landing place of Columbus in the New World on Watling Island (San Salvador) in the Bahamas, and built a monument on the spot as he had determined it. He led an expedition to the Arctic regions in 1894, reaching lat. 81°, northeast of Spitzbergen, and in 1898-9 a second expedition, reaching lat. 82° and discovering many islands. He wintered in Franz Josef Land and in the spring of 1899 made an unsuccessful dash for the pole. In May 1899 a party directed by E. B. Baldwin (q.v.), a member of the expedition, discovered Graham Bell Land. Accounts of this second expedition were written by Wellman for the 'National Geographical Magazine,' Vol. X. (1899), the 'Century Magazine,' new series, Vol. XXXV. (1899), and 'McClure's Magazine,' Vol. XIV. (1900).

Wells, Benjamin Willis, American journalist and author: b. Walpole, Cheshire County, N. H., 31 Jan. 1856. He was graduated from

WELLS

Harvard in 1877, studied also at Berlin, was a fellow of the Johns Hopkins University, in 1891-8 was professor of modern languages in the University of the South (Sewanee, Franklin County, Tenn.), and in 1898 became a member of the staff of 'The Churchman' (New York). His chief publications are 'Modern German Literature' (1895); 'Modern French Literature' (1897); and 'A Century of French Fiction' (1898), historical and critical studies. He also edited numerous German and French texts, contributed largely to periodicals, and edited (with W. P. Trent) 'Colonial Prose and Poetry' (1901), an anthology.

Wells, Carolyn, American humorous writer: b. Rahway, N. J. She took up literary work in 1895, and her many publications which are chiefly for juvenile readers, are: 'At the Sign of the Sphinx' (1896); 'The Story of Betty' (1899); 'Folly in Fairyland' (1901); 'Eight Girls and a Dog' (1902); 'The Pete and Polly Stories' (1902); etc.

Wells, Catherine Boott Gannett, American writer, daughter of E. S. Gannett (q.v.): b. England 1838. She was married in 1863 to S. Wells (d. 1903). She has been active in promoting educational advance and beside publishing Sunday School manuals has also published 'In the Clearings'; 'Miss Curtis,' a novel; 'About People,' a collection of essays; etc.

Wells, David Ames, American political economist: b. Springfield, Mass., 17 June 1828; d. Norwich, Conn., 5 Nov. 1898. He was graduated from Williams College in 1847, and from the Lawrence Scientific School in 1851, but before entering the latter institution had been assistant editor of the Springfield *Republican*, and was one of the promoters of the invention of a mechanism for folding books and newspapers in connection with the printing press. In 1851 he was appointed assistant professor at the Lawrence Scientific School, and was also lecturer on chemistry and physics at Groton Academy; during this earlier period of his life he published several text-books on the natural sciences. He first attained reputation as a political economist by an address on 'Our Burden and Our Strength,' read before a literary society of Troy in 1864; it discussed the resources of the United States in regard to the nation's debt-paying ability, and attracted the attention of the President, who summoned him to a conference in regard to the national finances. This resulted in the creation of a commission of three for the investigation of questions of taxation and revenue, of which commission Wells was chairman. In this capacity he was the first to collect economic and financial statistics for government use. In 1866 he was appointed to the office of special commissioner of revenue, was instrumental in abolishing the many petty taxes which had been imposed during the war, and originated most of the important forms and methods of internal revenue taxation adopted from 1866 to 1870. In the latter year the office which he held was abolished. He had at first been an advocate of the protectionist policy, but after a visit to Europe and a careful study of the English system, he changed his views, and advocated the system of free trade. In 1876 he was an unsuccessful candidate for Congress on the Democratic ticket. He published: 'Our Burden and Our Strength' (1864); 'The Creed

of the Free Trader' (1875); 'Why We Trade and How We Trade' (1878); 'The Silver Question, or the Dollar of the Fathers vs. the Dollar of the Sons' (1878); 'Our Merchant Marine; How it Rose, Increased, became Great, Declined, and Decayed' (1882); 'A Primer of Tariff Reform' (1884); 'Practical Economics' (1885); 'Relation of Tariff to Wages' (1888); 'Recent Economic Changes' (1898). His writings are notable for their clear and forcible presentation of a vast number of details and statistics.

Wells, Heber Manning, American politician: b. Salt Lake City 11 Aug. 1859. He was graduated from the University of Utah in 1875, and began early to take an active part in public life. He was recorder of Salt Lake City in 1882-90, and a member of the city board of public works in 1890 and in 1893. He was a member of the Constitutional Convention which framed the Constitution under which Utah was admitted as a State; in 1895 was elected governor of Utah for a five years' term on the Republican ticket, and in 1900 was re-elected for a four years' term. During the prolonged struggle between the mine owners and miners' unions in 1904, he maintained an impartial attitude as far as possible, but firmly opposed anarchy and disorder.

Wells, Herbert George, English author: b. Bromley, Kent, 21 Sept. 1866. He was educated at the Royal College of Science (South Kensington, London), published a 'Text-Book on Biology' (1892-3), and followed this by a series of works of fiction in which science and mechanics are employed for the accomplishment of various wonders narrated in the circumstantial and plausible manner of Verne. Among them are: 'The Time Machine' (1895); 'Select Conversations with an Uncle' (1895); 'The Wonderful Visit' (1895); 'The Island of Dr. Moreau' (1896); 'The Wheels of Chance' (1896); 'Thirty Strange Stories' (1897); 'The Invisible Man' (1897); 'The War of the Worlds' (1898); 'Tales of Space and Time' (1899); 'When the Sleeper Wakes' (1899); 'Love and Mr. Lewisham' (1900); 'Anticipations' (1901); 'The First Men in the Moon' (1901); 'Mankind in the Making' (1903); and 'Twelve Stories and a Dream' (1903). From 1894 to 1896 he was a member of the 'Saturday Review' staff.

Wells, Horace, American dentist: b. Hartford, Vt., 21 Jan. 1815; d. New York 24 Jan. 1848. He studied dentistry in Boston, and practised it there until 1836, then went to Hartford, Conn. For years he made investigations and experiments in search of an agent for preventing pain in the extraction of teeth, and finally became convinced that he had found such an agent in nitrous-oxide gas. In 1844 he made a practical test by having one of his own teeth extracted while he was under the influence of his supposed anæsthetic, and the operation confirmed his belief in the discovery. Thenceforth he used nitrous-oxide gas in his practice. He published 'A History of the Application of Nitrous Oxide Gas, Ether, and Other Vapors to Surgical Operations' (1847). His claims to the discovery of anæsthesia were controverted in the interest of G. Q. Colton, C. T. Jackson, W. T. G. Morton, and J. C. Warren (qq.v.), to each of whom some of the honors of its introduction

WELLS — WELLSVILLE

belong. Wells may have had a predecessor in C. W. Long (q.v.), but with regard to the first surgical use of an anæsthetic, all other names must yield priority to his. He became mentally unbalanced while advocating his claims in New York, was taken into custody, and committed suicide. A statue of Wells stands in Bushnell Park, Hartford, Conn. See ANÆSTHETICS.

Wells, Kate Gannett. See WELLS, CATHERINE BOOTT GANNETT.

Wells, Lemuel Henry, American Protestant Episcopal bishop: b. Yonkers, N. Y., 3 Dec. 1841. He was graduated from Hobart College in 1867, having during the Civil War served as a lieutenant in a Wisconsin regiment, and after being graduated from Berkeley Divinity School, Middletown, Conn., took priest's orders in the Episcopal Church in 1871. He was rector of Walla Walla, Wash., 1871-82; of Saint Louis, Tacoma, 1884-9; and of Trinity, Tacoma, 1889-92. In 1892 he was consecrated missionary bishop of Spokane.

Wells, Rolla, American capitalist and politician: b. Saint Louis, Mo., 1856. He entered business in the employ of a street railway company, and became assistant superintendent and finally general manager of the company. Giving up the latter position in 1883, he became prominently identified with a number of manufacturing and commercial corporations, and he is recognized as one of the leading business men of his native city. He has been active in local politics as a Democrat; was a delegate to the Democratic National Convention in 1896, and was elected mayor of Saint Louis in 1901 for a four years' term. Though nominated on the Democratic ticket, he received a large number of independent votes. His administration has been efficient and economical and he has taken an effective part in the preparation for the Saint Louis Exposition of 1904.

Wells, Webster, American mathematician: b. Boston, Mass., 4 Sept. 1851. He was graduated from the Massachusetts Institute of Technology in 1873, pursued special studies in civil engineering, and from 1873 was engaged in teaching at the Institute, attaining full professorship in 1893. He has written a series of mathematical text-books, among which are: 'Logarithms' (1878); 'Plane and Spherical Trigonometry' (1884); 'Higher Algebra' (1889); 'Complete Trigonometry' (1900); etc.

Wells College, a college for women, located in Aurora, N. Y. It was founded in 1868 by Henry Wells, who at that time deeded to the trustees the main building and 20 acres of land. It is undenominational in its control and policy. In 1888 the main building was destroyed by fire, but immediately rebuilt without crippling the work of the college. A preparatory course was at first maintained, but was abolished in 1896, when the range of elective system was also greatly increased. The college has now given up taking special students, as the regular applicants exceed the number that can be accommodated. Formerly the three degrees of A.B., B.L., and B.S. were conferred, but the A.B. degree is now granted for the completion of the course, which is largely elective, especially in the last two years. Biblical literature is among the required studies, courses in

the theory and history of music count toward the degree, but technical musical work does not. The discipline is by a system of student self government, based on a series of simple rules adopted and enforced by the students themselves. The college is situated on Cayuga Lake, and the College Boat Club has erected a boat house for the use of their members. The college buildings include the main hall, Morgan Hall, a dormitory (the former residence of the founder), a gymnasium, a science hall, and the administration building. The students in 1904 numbered 125, the faculty 21. Wells seeks to maintain its distinctive character as a small college, maintaining a high standard of college work, but not attempting university methods.

Wellsboro, wëlz'bûr-ô, Pa., borough, county-seat of Tioga County; on the Fall Brook Railroad (N. Y. C. & H. R.); about 80 miles north of Williamsport. It is in an agricultural and coal mining region. It has wagon and carriage factories, marble works, lumber mills, tanneries, and machine shops. There are two banks, the combined capital of which is \$150,000. Pop. (1890) 2,961; (1900) 2,954.

Wellsburg, W. Va., city, county-seat of Brooke County; on the Ohio River, and on the Pittsburg, Cincinnati, Chicago & Saint Louis Railroad; about 15 miles north of Wheeling. It is in an agricultural and sheep-raising region, and in the vicinity are numerous coal mines and natural gas. It has a fine city-hall, paper mills, glass factories, a sack factory, grist mill, and machine shop. There are three banks, having a combined capital of \$230,000. The place was founded in 1790. Pop. (1890) 2,235; (1900) 2,588.

Wellston, wëlz'tôn, Ohio, city in Jackson County; on the Cincinnati H. & D., the Ohio S., and the Baltimore & O. S. W. R.R.'s; about 72 miles in direct line southeast of Columbus. It is in an agricultural and coal mining region, and has considerable iron manufacturing. In 1900 (government census) the city had 41 manufacturing establishments capitalized for \$855,606. The cost of the raw material used annually was \$595,415 and the value of the annual products was \$1,056,110. The chief industrial establishments are foundries, blast furnaces, barrel factory, machine shops, cement works, and brick works. The city has a high school, public graded schools, and a public library. There are two banks with a combined capital of \$85,000 and (1903) deposits amounting to \$775,000. The city owns and operates the electric-light plant and the water-works. The government is vested in a mayor who holds office two years and a city council. The place was settled in 1871 and in 1876 was incorporated. Pop. (1890) 4,377; (1900) 8,045.

Wells'ville, N. Y., village in Allegany County; on the Genesee River, and on the Erie and the Buffalo & S. R.R.'s; about 25 miles southwest of Hornellsville. It is in an agricultural and dairy region, and in the vicinity are a number of oil wells. It has foundries, machine shops, creameries, flour mill, tanneries, and cigar factories. There are two national banks with a combined capital of \$150,000. It has a high school, graded elementary schools, and a public library. Pop. (1890) 3,435; (1900) 3,556.

WELLSVILLE—WEN-CHOW

Wellsville, Ohio, city in Columbiana County; on the Ohio River, and on the Pennsylvania Railroad; about 85 miles southwest of Cleveland. It is in an agricultural and coal mining region, and in the vicinity are valuable deposits of fire clay. The chief manufacturing establishments are machine shops, foundries, iron and steel works, brick and tile works, potteries, nail factory, boiler works, and railroad shops. In 1900 (government census) there were 61 manufacturing establishments which were capitalized for \$1,233,863, and whose annual finished products brought \$1,548,190. There are three banks; the two national banks have a combined capital of \$150,000. There are nine churches, a high school, public and parish schools, and a public library. The city owns and operates the water-works. Pop. (1890) 5,247; (1900) 6,146.

Welsbach (wëlz'bäh) **Light**, an invention of Carl Auer von Welsbach, an Austrian, in 1884. In Europe it is known as the Auer light. It is based upon the discovery that certain materials become incandescent at a low temperature. The process followed is to saturate a combustible filament in the form of a network with a solution of a salt of a refractory earth, such as zirconium. It is then dried out and burned, the combustible element disappearing and leaving a frame of refractory material, which becomes incandescent at a low temperature. See RAILWAY TRAIN LIGHTING.

Welsh, Herbert, American reformer: b. Philadelphia, Pa., 4 Dec. 1851. He was graduated from the University of Pennsylvania in 1871; studied art in Philadelphia and in Paris with Bonnat; and practised as an artist in Philadelphia for several years. Visiting the Sioux reservation, impressed with the belief that the Indians required only a just and consistent treatment by the government and the extension of Christian missions to become civilized, he began a movement to secure to them their rights, which resulted in the organization of the Indian Rights Association in 1882. He became corresponding secretary of this association and has been active in its work, which has been instrumental in securing the passage of a bill providing for the individual ownership of land, and the application of the civil service law to the Indian service. He also took a leading part in the reform movement in Pennsylvania State politics in 1890; and in 1895 established a weekly periodical 'City and State,' published in the interests of good government. He has strongly opposed the tendency toward imperialism, and has severely criticised the government's policy and the evils attending the army's occupation of the Philippines. He has written 'Four Weeks among some of the Sioux Tribes'; 'Civilization among the Sioux Indians'; 'A Visit to the Navajo, Pueblo, and Hualpais Indians'; 'The Other Man's Country' (1900), dealing with the Philippine question.

Welsh, John, American merchant: b. Philadelphia 9 Nov. 1805; d. there 10 April 1886. He was educated in his native city, where he became prominent in business and was active in public affairs in many capacities, having large railroad and financial interests. He was a member of the Sinking Fund Commission, president of the Philadelphia Board of Trade, etc., and rendered efficient service in promoting relief

measures during the Civil War, especially in connection with the Philadelphia Sanitary Fair, in 1864, of which he was president, and which raised over \$1,000,000 for army hospital work. In 1873 he became president of the Board of Finance of the Centennial Exhibition, receiving from the citizens of Philadelphia, at its close, a gold medal, and the sum of \$50,000, with which he endowed the John Welsh chair of English literature in the University of Pennsylvania. In 1878 he went as minister to England, but in the following year resigned.

Welsh Calvinistic Methodists, a designation sometimes given to the Calvinistic Methodists, because Wales is the great seat of the sect. The Calvinistic Methodists are distinguished by their Calvinistic sentiments from the ordinary Wesleyans, who are Arminian. Whitfield is regarded as the father and founder of Calvinistic Methodism. Members of this sect have been active in recent years in seeking to bring about the disestablishment of the Anglican Church in Wales. See METHODISM.

Welsh Language and Literature. See CELTIC LANGUAGES.

Welwitschia, wël-wich'i-ä, a genus of plants of the order *Gnetaceæ*, containing only one species, *W. mirabilis*. This species is confined to the deserts of Southwest Africa, where it was discovered in 1860 by Friedrich Welwitsch. It has a short and top-shaped stem which never grows much above the surface, but increases in thickness, until it may be three feet in diameter, and bears a pair of large opposite leaves. These leaves last throughout the whole lifetime of the plant, and become ultimately torn up longitudinally into long strips, which trail on the surface of the ground. Two cotyledons which are like short-lived leaves of much smaller size precede them. The flowers of the plant grow in cones like those of many conifers, the cones being arranged in panicles on the end of the stem between the two leaves. The female cones are much larger than the male ones, and in fruit are of a scarlet color.

Wen, an encysted tumor, moderate, but considerably varying in size, occurring in different parts of the body; commonly situated immediately under the skin, but most frequently on the scalp. The causes of their formation are unknown, but a strongly marked tendency to such swellings exists in particular individuals, leading to the belief in constitutional causes. At its commencement the wen is always exceedingly small and perfectly indolent, and it is often many years before it attains any considerable size. It is enclosed in a sac, its contents being sometimes sebaceous matter, in other cases serum, or a thin fetid brown or black fluid. Sometimes the sac contains cartilaginous or even osseous matter. Frequently the sac, especially when small, may be punctured, and its contents pressed out; but sometimes this gives rise to very severe inflammatory action. Another and safe mode of treatment is to dissect them out with the knife wherever their position will admit of it, care being taken to remove the whole of the cyst.

Wen-chow, wün' chow', China, a treaty port in the province of Che-kiang, on the estuary of the Ta-kai river, flowing into the China Sea; about 200 miles south by west of Shanghai.

WENATCHI — WENDS

Ruined palaces, gates, and triumphal arches are among the numerous signs of its vanished greatness, but it is still a comparatively clean town, with broad streets. Among buildings of recent erection are the custom-house and the branch of the Imperial Chinese Postoffice. The chief imports are cottons, kerosene, sugar, opium, iron, and woollens; the principal exports are tea, umbrellas, timber, and oranges. The average annual values of the imports and exports during several recent years were about \$850,000 and \$290,000 respectively. The tonnage of shipping entered in 1901 was 26,044. There is also a considerable junk trade. Pop. about 80,000.

Wenat'chi. See SALISHAN INDIANS.

Wenceslas, wén'sčs-lās or -lās, or **Wenzel**, Emperor of Germany and King of Bohemia: b. 1361; d. Schlagfluss 16 Aug. 1419. He was the son of Charles IV. (q.v.), whom he succeeded in 1378. In 1394 the Bohemian nobility formed a conspiracy against him and held him prisoner at Prague, but later released him. Through the influence of the archbishop of Mainz, whose enmity he had aroused by demanding the resignation of the rival Popes, Benedict XIII. and Boniface IX., he was deposed by the Imperial electors, while the Elector Palatine Rupert was chosen to succeed him. In Bohemia he supported John Huss (q.v.) and the latter's party, and in 1409 compelled by a decree the departure of the Germans from the University of Prague. Shortly afterward he resigned the royal title. Consult Lindner, 'Geschichte des Deutschen Reiches unter König Wenzel' (1875-80).

Wend Language. The language of the Wends is similar to the other branches of the northwestern stem of the Slavic languages, the Polish and the Bohemian. It is divided into the dialect of Lower Lusatia, which is but little developed, and that of Upper Lusatia. The latter is subdivided into the Evangelical dialect, near Bautzen; the Catholic dialect, near Kamenz and in the northwest; and the northeastern dialect. The differences are mostly confined to shades of pronunciation. The stock of words in the present language of the Wends is largely mixed with German elements. Orthography has always been in a very unsettled condition, and especially a subject of controversy between Catholics and Protestants; but in modern times attempts at reconciliation and improvement have met with approval on both sides. In their publications, the Wends have mostly made use of the German letters. There are eight vowels, *a*, *o*, *u*, *e*, *i*, all of which are pronounced as in German and Italian, *ö* (between *o* in *note* and *u* in *full*), *ê* (like long English *e*), and *y* (approaching the German *ü*). Of consonants there are 32: *j* (*y* consonant), *w* (*v*), *ŵ* (*v* soft), *b*, *ŋ* (soft), *p*, *f* (soft), *m*, *ŋ* (soft), *n*, *ñ* (soft, Fr. *gn*), *l*, *ž* (like *v*), *r*, *ř* (soft), *s*, *š* (Fr. *j*), *s*, *š* (*sh*), *d*, *ds*, *dš* (*dsh* soft), *ds*, *t*, *c* (*tz*), *č* (*tch* soft), *č* (*tch*), *ts*, *h*, *ch*, (*k*), *g* (hard), *k*. There is no article. The substantives are of three genders, masculine, feminine, and neuter. Substantives ending in a consonant are mostly masculine, those in *a* and *i* feminine, and those in *o* and *e* neuter. There are seven declensions, two for the masculine, three for the neuter, and two for the feminine. The language has a dual number.

There are seven cases, namely, nominative, accusative, genitive, dative, locative (to express the relation of *in*), instrumental (to express the relations of *by* and *with*), and vocative. The adjectives end in *y*, *i* (masculine), *a* (feminine), *o* and *e* (neuter). The comparative is formed by the termination *ši*, and in order to form the superlative the syllable *naj* is placed before the comparative. The personal pronouns are irregular; the others are declined like adjectives. The verb has six tenses, present, imperfect, perfect, pluperfect, future, and future perfect; five moods, indicative, subjunctive, optative, imperative, and infinitive, beside a gerund; and three participles, present and perfect active, and perfect passive. Till about the middle of the 19th century Wendish literature consisted almost wholly of ecclesiastical and religious works, and works relating to the needs of peasant life, but there has since been a revival of national feeling, accompanied by a more extended literature. There are grammars of the Wendish language by Lincus (Prague 1679), Matthäi (1721), Seiler (Bautzen 1830), and Jordan (Prague 1841).

Wendell, Barrett, American educator and author: b. Boston, Mass., 23 Aug. 1855. Graduated from Harvard in 1877, he studied also in the Harvard Law School, in 1880-8 was instructor in English at Harvard, in 1888-98 assistant professor, and in 1898 became professor. He was Clark lecturer at Trinity College, Cambridge, England, in 1902. Among his works are 'The Duchess Emilia' (1885); 'Rankell's Remains' (1897); 'English Composition' (1891); 'Cotton Mather' (1891); 'Stelligeri, and Other Essays Concerning America' (1893); 'William Shakespere' (1894); 'A Literary History of America' (1900; in the 'Library of Literary History'), a scholarly work, though much criticised for its unjust attitude toward certain writers; and 'Raleigh in Guiana' (1902), an attempt at imitation of the Elizabethan drama. He also contributed the interesting chapter on 'The American Intellect,' to Vol. VII., 'The United States,' of the 'Cambridge Modern History.'

Wends, a former powerful Slavic tribe settled in Germany, now represented by the Slavic people of Upper and Lower Lusatia, who call themselves Serbs (*Serbo*), whence the name Sorbs, often applied to them by German authorities. In the earliest historical times the Sorbs occupied the country from the Saale to the Bober, and from the latitude of Berlin south to the Erzgebirge; but the Wends are now confined to a small territory (about 1,270 square miles) in the upper Spree valley, extending from south of Bautzen to north of Kottbus. The larger part of this Wendish region belongs to the Prussian provinces of Brandenburg and Silesia, the smaller southern part being included in the kingdom of Saxony (circle of Bautzen). The Wends are completely surrounded by Germans, and being thus cut off from contact with the other Slavs, they are becoming slowly Germanized. Their language, known as Sorbian, falls into two dialects, Upper and Lower Sorbian, which are spoken in the south and the north of the territory respectively. (See WEND LANGUAGE.) The total number of Wends is about 120,000, of whom about 50,000 live in Saxony and 70,000 in Prussia. About 12,000 are Roman Catholics, the remainder being chiefly Lutherans.

WENER—WENTWORTH

Wener, vā'nēr, or **Vener**, Sweden, the largest lake of the country, and after those of Ladoga and Onega the largest in Europe, situated centrally between the läns of Wermland, Dalsland, and Wester Gotland. It is 147 feet above sea-level, and of irregular shape. Its greatest length, northeast to southwest, is about 100 miles; and its breadth may average about 30 miles, though in its lower part, where two peninsulas stretch far into it from opposite directions, it is not more than 15 miles. This distance is still further narrowed by a group of small islands, and hence the part of the lake above these peninsulas is sometimes considered as Wener proper, while the part below is called Lake Dalbo. The area covered by both is 2,242 square miles. By far the most important feeder is the Klar-elf, which pours in at its north end the accumulated water of a course of more than 250 miles. Its only proper outlet is at Wenersborg at its southwestern extremity, where its superfluous waters are received by the Göta-clf. In summer steamers and other vessels ply regularly upon the lake; in winter it is frozen for several months, and crossed by sledges. It abounds with fish, particularly trout. The Göta Canal connects Lake Wener with Lake Wetter, and the Dalsland Canal connects it with Fredrikshald in Norway.

Wen'ley, Robert Mark, American educator: b. Edinburgh, Scotland, July 1861. He was graduated from the University of Glasgow in 1884, and later studied in Edinburgh, and on the Continent. He was in charge of the philosophical department of Queen Margaret College, Glasgow, in 1888-95, and since 1896 has been at the head of that department in the University of Michigan. He has published: 'Socrates and Christ' (1889); 'University Extension Movement in Scotland' (1895); 'Contemporary Theology and Theism' (1897); 'Preparation for Christianity in the Ancient World' (1898); etc. He was an associate editor of the 'Dictionary of Philosophy.'

Wen'lock Group, a British formation of the Upper Silurian geological series. It includes shales and limestones, and is below the Ludlow group, and above the Upper Llandovery group, these three comprising the Upper Silurian groups. The Wenlock formation is about 4,000 feet thick, and the fauna has been classed as consisting of 171 genera, and 530 species, but many supposed vegetable remains are almost certainly not such. See SILURIAN.

Wensleydale, wēnz'li-dāl, **James Parke**, BARON, English jurist: b. Highfield, near Liverpool, 22 March 1782; d. Amptill Park, Bedfordshire, 25 Feb. 1868. Graduated from Trinity College, Cambridge, in 1803, he was called to the bar at the Inner Temple in 1813, went the northern circuit, and became known for his wide knowledge of common law. In 1828 he was made a justice of the court of king's bench, in 1834 was transferred to the court of the exchequer. Here he remained strongly influential until his resignation in 1856, when he entered the Lords as Baron Wensleydale of Walton (Lancaster). In Parliament he spoke rarely, and chiefly on legal questions. His judgments were highly ranked. Consult Foss, 'The Judges of England' (1848-64), or the abridgment of the same, 'Biographia Juridica' (1870); Manson, 'Builders of Our Law' (1895).

Wen'tletrap, a gastropod mollusk, allied to the turret shells and of the genus *Scalaria*, in which the shell is turreted, spiral, and ornamented with elevated rib-like processes, crossing the whorls lengthwise of the shell. In some species the spiral is closed; but in the "true" wentletraps the whorls are open, that is, separated. Of the former, some are found in northern seas, and the latter are all natives of warm seas. They are inhabitants of deep waters, but their shells are cast up in great numbers on sandy coasts. They are carnivorous in habits. The famous precious wentletrap, or royal staircase (*Scalaria pretiosa*), formerly brought prices ranging as high as \$250 when purchased for the conchologist's cabinet, but its value in the present day is small. Its shell is about two inches long, and twisted in a wide spiral form, and is generally pale-yellow with white ribs.

Wentworth, wēnt'wérth, **Benning**, English governor of New Hampshire: b. Portsmouth, N. H., 24 July 1696; d. there 14 Oct. 1770. He was graduated at Harvard in 1715, became a merchant at Portsmouth, which town he frequently represented in the provincial assembly, was appointed a king's councillor in 1734, and when in 1741 New Hampshire was made a distinct province he became its governor. He so continued until 1767, when he resigned. He was authorized by the crown to grant patents of unoccupied land, and in 1749 began making grants on the west side of the Connecticut River, in what is now southern Vermont. These grants were considered by the colonial government of New York as within its domain, and, as Governor Wentworth stoutly maintained for a time his authority, the collision so famous in the history of Vermont respecting the New Hampshire grants ensued. (See VERMONT, *History*.) Governor Wentworth exacted heavy fees for his grants of land, and thus accumulated a large property, and in all of them stipulated for the reservation of a lot for an Episcopal church. The town of Bennington, Vermont, was named in honor of him. After his resignation as governor he gave to Dartmouth College 500 acres of land, on which the college buildings were erected. For an account of his second marriage, consult Longfellow's poem 'Lady Wentworth.'

Wentworth, Charles Watson. See ROCKINGHAM, 2D MARQUIS OF.

Wentworth, George Albert, American mathematician: b. Wakefield, N. H., 31 July 1835. He was graduated from Harvard in 1858 and in 1858-91 was professor of mathematics at Phillips Exeter Academy. With G. A. Hill he prepared a series of text-books on algebra, arithmetic, geometry, and physics, and he is author of the Wentworth Series of mathematical works comprising about 40 volumes, among which are: 'Elements of Geometry' (1878); 'Surveying and Navigation' (1882); 'Elements of Analytic Geometry' (1886); 'Higher Algebra' (1891); etc.

Wentworth, Sir John, English colonial governor of New Hampshire and afterward of Nova Scotia: b. Portsmouth, N. H., 9 Aug. 1737; d. Halifax, N. S., 8 April 1820. He was a nephew of Benning Wentworth (q.v.). He was graduated at Harvard in 1755, being a classmate of John Adams, became a merchant, and in 1765 was the agent of New Hampshire to present petitions in England. While there he was ap-

pointed to succeed Benning Wentworth as governor of New Hampshire. At the same time he was made "surveyor of the king's woods" for all North America. Having landed at Charleston, S. C., in March 1767, he traveled through the colonies, registering in each his commission as surveyor, and arrived at Portsmouth in June. The office of governor was at that time an extremely difficult one by reason of the increasing discontent of the colonists. At the first, Wentworth's administration was very popular. He remonstrated against the taxes imposed by the English government, but sought to maintain the loyalty of the colony, and was successful in preventing the assent of Portsmouth to the non-importation agreements until 1770. In this he was aided by the fact that the Portsmouth merchants were disinclined to forego such profits as they might still obtain despite the crippled state of commerce. When the last attempt was made to compel the colonies to receive East Indian tea, he took advantage of lack of instructions from the government, and had the consignee reship the cargo to Halifax. His authority ended, however, when it was learned that he had endeavored to comply with the request of General Gage to obtain carpenters to construct barracks for the British troops at Boston, after Massachusetts workmen had refused the task. On 14 Dec. 1774 an armed attack was made on Fort William and Mary (now Fort Constitution) on Great Island, at the entrance to Portsmouth harbor, and 100 barrels of powder and some cannon and muskets were taken. Wentworth finally found it advisable to withdraw to the fort, and then to a warship in the harbor. At the Isle of Shoals he prorogued the assembly, his last official act. He went to Boston, and thence to England. From 1792 to 1808 he was lieutenant-governor of Nova Scotia. He was active in the foundation of Dartmouth College. Nine MSS. volumes of his correspondence are in the public records of Halifax. He was made a baronet in 1795.

Wentworth, John, American journalist: b. Sandwich, N. H., 5 March 1815; d. Chicago, Ill., 16 Oct. 1888. He was graduated from Dartmouth in 1836 and the same year went to Chicago where for 25 years he was owner and editor of the 'Democrat.' He studied law, was admitted to the bar in 1841, and in 1843 was elected to Congress where he served six terms. He introduced the first steam fire engine into Chicago, was active in procuring the city charter, an earnest promoter of the public school system, and in 1857 and 1860 was elected mayor. He dissolved his connection with the 'Democrat' in 1861, but did not retire from active life for many years. He gave \$10,000 to Dartmouth College, was president of its alumni in 1883 and wrote: 'Descendants of Elder William Wentworth' (1850); and 'History of the Wentworth Family' (1878).

Wentworth, Thomas. See STRAFFORD, 1ST EARL OF.

Werff, vërf, Adriaan van der, Dutch painter: b. Kralingen, near Rotterdam, 21 Jan. 1659; d. Rotterdam 12 Nov. 1722. He became a pupil of Van der Neer, settled in Rotterdam, and in 1696 attracted the notice of the Elector Palatine, who was thenceforward his liberal patron, and who ennobled him in 1703. Among his celebrated paintings are the 'Judgment of

Solomon'; 'Christ Carried to the Sepulchre'; 'Ecce Homo'; 'Abraham with Sarah and Hagar'; and 'Magdalen in the Wilderness.' Van der Werff was particularly noted for his small historical pieces, which are most exquisitely finished, and are still in high request. His brother and pupil, PIETER VAN DER WERFF (1665-1718), painted portraits and domestic pieces.

Wergild, wër'gild, or **Weregild**, wër'gild, derived from the Anglo-Saxon *wer*, a man, and *geld*, satisfaction, and meaning the price in money paid either to kinsmen or to the state, or both, as satisfaction in a case of homicide or other crime against the person. The wergild extended to offenses of the highest grade. It was also sometimes exacted when the killing was not criminal, as in the case of a thief slain in battle. It was eminently a Teutonic institution, and the amount of wergild varied with different tribes. Among the Anglo-Saxons the wergild for taking the life of the king was 7,200 shillings; for an eolderman 2,400 shillings; a king's thegn 600 and a ceorl 200. In the Anglo-Saxon period an alderman or eolderman was a much more important personage than the alderman of to-day, the aldermen of all England being the first subjects of the realm, and other aldermen being governors of counties. Even kings were called aldermen. The thegn, or thane, was a minor noble, and the ceorl, or churl, a tenant-at-will of the thane, or he might be simply a serf or farm-laborer. As the value of money, measured by its purchasing power, was far greater than to-day, the wergild for king and alderman, and even for thane, must have been prohibitory save for the wealthiest members of the community, or when the state assumed the burden of payment, as in the case of an enemy of high rank killed in war, whose relatives were able to wreak vengeance for his death.

Wergild for a homicide had to be paid to the king and the kindred, and also to the thane, or overlord of the slain man. The relatives were not obliged to accept the price of their kinsman's blood, but might, if they chose, exact life for life. If the relatives were satisfied, however, it was not difficult to make terms with the king and thane. The wergild passed away when Norman succeeded to Anglo-Saxon rule, and while fines continued to be imposed on offenders, there was no escape from the capital penalty for homicide except in trial by combat.

Wergeland, vër'gë-länd, Henrik, Norwegian poet: b. Christiansand 17 June 1808; d. Christiania 12 July 1845. He studied at Christiania, in 1836 became custodian of the university library, and in 1840 keeper of the Norwegian archives. He was one of the leaders of the Ultra-Norwegian party, waging war on all things Danish, but found opponents in Welhaven and the latter's school. In 1830 he published the dramatic poem 'The Creation, Man and Messiah,' a work of formidable length and slight literary merit. His chief publications are the narrative poems, 'Jan van Huysum's Flower-Piece' (1840); 'The Swallow' (1841); 'The Jew' (1842); 'The Jewess' (1844), and 'The English Pilot' (1844), which take high rank in Norwegian verse. His complete collected works appeared in 1852-7, a selection in 1859. Consult the biographies by Lassen (1867), Schwanenflügel (1877), and Skavlan (1892).

Werner, věr'něr, **Abraham Gottlob**, German mineralogist: b. near Bunzlau, 25 Sept. 1750; d. Dresden 30 June 1817. In 1775 he was appointed inspector and teacher of mineralogy and mining in the Mining Academy at Freiberg, in which position he remained for the rest of his life. He was the first to separate geology from mineralogy, and to place the former on the basis of observation and experience. The geological theory with which his name is connected is that which attributes the phenomena exhibited by the crust of the earth to the action of water, and is known as the Wernerian or Neptunian theory, in contradistinction to the Huttonian or Plutonic. He was nominated counsellor of the mines of Saxony in 1792, and had a great share in the direction of the Academy of Mining, and in the administration of public works. He published 'Kurze Klassifikation und Beschreibung der Gebirgsarten' (1787); 'Neue Theorie über die Entstehung der Gänge' (1771). Consult 'Life' by Frisch (1825).

Werner, Friedrich Ludwig Zacharias, German dramatist: b. Königsberg 18 Nov. 1768; d. Vienna 17 Jan. 1823. After attending Kant's lectures in his native town, he became in 1793 chamber secretary in the Prussian service, and in 1805 obtained a government post in Berlin, but two years later he retired from the public service. In 1811 he joined the Roman Catholic Church, and in 1814 was consecrated priest at Aschaffenburg. Taking up his residence in Vienna, he became known as an eloquent preacher and later was appointed head of the chapter of the cathedral of Kaminiec. Werner's dramatic works reveal much of the power and pathos characteristic of Schiller, but overlaid in a constantly increasing extent, as he advanced in years, by mystical and undramatic elements. The chief of them are: 'Die Söhne des Thals' (1804); 'Das Kreuz an der Ostsee' (1806); 'Martin Luther oder die Weihe der Kraft' (1807); 'Attila' (1808); 'Wanda' (1810); 'Die Weihe der Unkraft' (1813), a sort of retraction of the earlier play on Luther; 'Kunigunde die Heilige' (1815); 'Der 24. Februar' (1815); 'Die Mutter der Makkabäer' (1820).

Wernerite, an important rock-forming mineral, occurring in cleavable-granular, indistinctly-fibrous or columnar masses, or often in large, coarse crystals. These are tetragonal prisms terminated by pyramids, and show good prismatic cleavage. The hardness is 5 to 6 and specific gravity about 2.7. The most common colors are white or gray; lilac is also quite abundant; occasionally greenish and brick-red varieties are found. Wernerite is a member of the scapolite group (q.v.) and is intermediate in composition between meionite and marialite, being a silicate of aluminum, calcium and sodium, with chlorine. It usually occurs in crystalline limestone. Among its many localities a few of the most important are Arendal, Norway; Bolton, Massachusetts; northern New York, Ontario and Quebec. The mineral was named (in 1800) in honor of the distinguished mineralogist, A. G. Werner.

Werwolf, wër'wulf, or **Werewolf**, wër'wulf, a human being transformed into a wolf, according to a belief which has prevailed in all ages and ignorant and superstitious communities. Herodotus, with great naïveté, tells us that when he was in Scythia he heard of a people which

once a year changed themselves into wolves, and then resumed their original shape; "but," adds he, "they cannot make me believe such tales, although they not only tell them, but swear to them." But the lycanthropes of the Middle Ages, or *loups-garous*, as they were called by the French, were sorcerers, who during their wolf-hood had a most cannibal appetite for human flesh. The Germans called them *Währwölfe*. Many marvelous stories are told by the writers of the Middle Ages of these wolf-men or *loups-garous*, and numerous authentic narratives remain of victims committed to the flames for this imaginary crime, often on their own confessions.

It is certain that faith in the power of witches to assume the shape of animals, such as wolves, dogs, cats, or horses, existed at a comparatively recent time, and is probably not extinguished yet in Western Europe. In the Balkan States, or part of them, belief in the werwolf flourishes to this day, along with the kindred vampire superstition. An old writer says that "the werewolves are certain sorcerers, who, having anointed their bodies with an ointment which they make by the instinct of the devil, and putting on a certain enchanted girdle, do not only unto the view of others seem as wolves, but to their own thinking have both the shape and nature of wolves, so long as they wear the said girdle; and they do dispose of themselves as very wolves, in worrying and killing, and most of human creatures."

The werewolves were said to have in some instances a special hatred of religion and its devotees, and this, coupled with the charge of devouring human flesh, left no doubt as to the fate of anyone who fell under suspicion of being a werwolf. The superstition itself was doubtless due in part to the brutal and savage aspect of human beings who, owing to melancholia or other forms of insanity, went wild in the woods—an occurrence not infrequent in remote districts in the Middle Ages. It was also in all probability connected with the belief, which was a prominent feature of mythology, in the power of the gods and inferior spirits to enter the bodies of animals, and with the doctrine of transmigration of souls, common alike to the ancient Egyptians, the followers of Pythagoras and the Hindus. See WITCHCRAFT.

Wesel, vā'zēl, Germany, a town in the Rhine province of Prussia, on the right bank of the Rhine, at the mouth of the River Lippe, 35 miles north by west of Düsseldorf. The Rhine is here crossed by a railway and a pontoon bridge, and the Lippe by a railway and two other bridges. The fortifications were demolished in 1890, except the citadel and four outer forts, one of which, Fort Blicher, is on the left bank of the Rhine. The Berlin gate, with statues of Hercules and Minerva, dates from 1722. The principal church was founded in the 12th century, and dates in its present form from 1521. It was restored in 1883-96. The town-hall, with a Gothic façade, was completed in 1390. The other buildings and institutions include the Lower Rhine Museum, formerly a French church; the artillery barracks, formerly a Dominican monastery; a royal gymnasium and other higher educational institutions; two hospitals, an orphanage, and the fortress prison. Soap, wire, and cement are manufactured, and

there are also sugar refineries, brick works, flour and oil mills, steam saw-mills, etc., besides a trade in timber, grain, etc. There is ample harbor and quay accommodation. Wesel can be traced back to the 8th century. It was a member of the Hanseatic League, and adopted the Reformation in 1540. It came into Prussian possession in 1814. Pop. (1900) 22,547.

Weser, *vá'zér* (Latin, *Visurgis*), a river of Germany, formed by the junction of the Fulda and Werra at Münden, between the provinces of Hanover and Hesse-Nassau. It flows tortuously first northwest, then north-northeast between Westphalia and Brunswick and after a circuitous northwestern course, traverses the town and the territory of Bremen, forms the boundary between Hanover and Oldenburg, at Elsfleth turns almost due north, and falls by a wide mouth, encumbered with sandbanks, into the German Ocean. Its whole course is about 430 miles. It is navigable by barges to some distance up both head-streams, but the practical limit of summer navigation is Ilameln. The lower part, from Bremen to Bremerhaven, has been deepened and improved for large vessels.

Wesley, *wě'slī*, **Charles**, English clergyman and hymn-writer, younger brother of John Wesley: b. Epsom, Lincolnshire, 18 Dec. 1707; d. London 29 March 1788. He was educated at Christ Church, Oxford, and there he began, he says, "to observe the method of study prescribed by the university," adding, "this gained me the harmless nickname of Methodist"—a word at first apparently without religious significance, and meaning one who affected method. In 1735 he was ordained priest. Charles accompanied his brother to Georgia, where he was not very successful, and having returned to England in 1736, became unlicensed curate of St. Mary's, Islington, where he remained until 1739. In 1739-56 he was an active itinerant preacher. He differed from his brother on some doctrinal and other points, holding, for example, that perfection must be attained by a gradual process. After residing for some years at Bristol and Bath, he went to London in 1771. He is said to have written 6,500 hymns, of which many are well known, about 500 being said to be in general use. Consult the biographies by Jackson (1849) and Telford (1866), and Julian, 'Dictionary of Hymnology' (1892).

Wesley, **John**, English clergyman, founder of Methodism: b. Epworth, Lincolnshire, 17 June 1703; d. London 2 March 1791. He was a younger son of the Rev. Samuel Wesley (q.v.), and was educated at Charterhouse, and at Christ Church, Oxford. He took his degree in 1724, was ordained deacon in 1725 and became a fellow of Lincoln College, in which he was appointed Greek lecturer and moderator. He was of a serious and religious turn of mind, and books which impressed him powerfully were the 'Imitatio Christi' and Taylor's 'Holy Living and Holy Dying.' He took priest's orders in 1728, and about the close of 1729 was called from acting as his father's curate to perform the duties of his fellowship in person. At Oxford he found an association of students of which his brother Charles was a member. It was known by various nicknames, among which were the Holy Club, the Bible Moths, the Sacramentarians, and the Methodists. It appears that all the associ-

ation did at this time to earn these opprobrious epithets was to meet on Sunday evenings to read the Scriptures, and on other evenings to read secular literature. John Wesley joined this society, which gradually became exclusively religious in its object, and highly ascetic in its tone. Its members fasted twice and communicated once a week, visited prisons and the sick, and engaged frequently in prayer, meditation, and self-examination. Among the members were Hervey and Whitefield. At the time John Wesley joined it the society numbered very few members, but it gradually increased, though it never became a large body. This induced him to decline his father's living at Epworth, that he might continue to exercise his influence at the university. During his residence at the university he became acquainted with Law, author of the 'Serious Call to the Unconverted,' who exercised much influence over him. In 1735 he accepted an invitation from Gen. Oglethorpe to preach to the colonists of Georgia. He sailed on 10 Dec. with his brother Charles and a considerable body of Moravians. During his visit to the colony he paid his addresses to Sophia Hopkey, niece of the chief magistrate of Savannah, or rather, as the story is told, received her advances with favor, but ultimately declined to marry her. Miss Hopkey married a Mr. Williamson, and Wesley, without assigning a reason, refused to admit her to the communion. Her husband threatened legal proceedings, which were not enforced, but Wesley, on account of this event, left the colony, "shaking the dust from his feet." He reached England 1 Feb. 1738, just as Whitefield, under whose preaching Methodism had made great progress, sailed for Georgia. At this time an important event took place in the inner religious life of Wesley. He was converted, according to his own account, about a quarter to 9 o'clock on the evening of 24 May 1738, at a meeting to which he had gone very unwillingly, while Luther's 'Preface' to the Epistle to the Romans was being read. On 13 June he set out for Germany to visit Herrnhut. He met Count Zinzendorf at Marienborn, spent a fortnight at Herrnhut, and returned to England about the middle of September. Whitefield returned from Georgia soon after, and became intimately associated with Wesley. He began open-air preaching near Bristol in the following February, and his example was soon followed by Wesley. On 11 Nov. 1739 Wesley first preached at the Foundry, a disused structure, formerly employed by the government for casting brass ordnance. This he enlarged and repaired, and until 1778 it remained the Methodist headquarters in London. Somewhat later he founded the 'United Society,' for week-day meetings. From the beginning of this society the inception of Methodism is generally dated.

In July 1740 Wesley separated from the Moravians, on account of doctrinal differences. He soon afterward separated from Whitefield, but without a permanent personal breach. Wesley had now sole control of the religious body which adhered to him, and he devoted his entire life without intermission to the work of its organization, in which he showed much practical skill and admirable method. His labors as an itinerant preacher were incessant. He had no permanent residence, and never inter-

mitted his journeys on account of the weather. He would ride from 40 to 60 miles in a day, read or wrote during his journeys, and frequently preached four or five times a day or oftener. He married in 1750 Mrs. Vazeille, a widow with four children, but his habits of life, which he did not attempt to accommodate to his wife, produced an alienation, and they finally separated. Wesley held strongly to the principle of episcopacy, though not a believer in the apostolic succession; and he never formally separated from the Church of England. His collected works were published by himself in 1771-74 in 32 volumes. But in these only a part of his literary output was included, his publications being of the most miscellaneous character, including grammars, an English dictionary, biographies, manuals of history, logic, medicine, which together brought him in large sums of money. In 1780 he commenced a monthly, the 'Arminian Magazine,' which he edited during his life, and which after his death was merged in the 'Methodist Magazine.'

Against pre-Revolutionary troubles in America he directed 'A Calm Address to our American Colonies' (1775), 'A Calm Address to the Inhabitants of England' (1777), and 'A Serious Address' (1778). He also wrote many hymns, which are included in the 'Poetical Works of John and Charles Wesley' (1868-72). A John Wesley bicentary was celebrated in June 1903. Consult the biographies by Hampson (1791); Coke and Moore (1792); Whitehead (1791-3); Moore (1824-5); Southey (1820), with 'Notes' by Coleridge and 'Remarks' by Knox, in 1846; Watson (1831); Tyerman (1870-1); Rigg (1875); Green (1881); and Overton (1891); Wesley's 'Journals' and 'Correspondence,' parts of which are to be found in the various editions of his collected works, first published under his own editorship in 1771-4; Taylor's 'Wesley and Methodism' (1851); Umlin, 'Wesley's Place in Church History' (1870); a bibliography by Green (1896); and standard histories of Methodism. See also METHODIST EPISCOPAL CHURCH, THE.

Wesley, Samuel, English clergyman and poet: b. Winterborne-Whitchurch, Dorsetshire, 17 Dec. 1662; d. Epworth, Lincolnshire, 25 April 1735. He was the father of Charles, John, and Samuel Wesley, Jr. Graduated from Exeter College, Oxford, in 1688, he was ordained priest in 1690, became rector of South Ormsby, Lincolnshire, in that year, and in 1695 of Epworth in the same county. He wrote 'Life of Christ: An Heroic Poem' (1693); 'Eupolis's Hymn to the Creator' (1778); and other works, including the posthumous 'Dissertationes in Librum Jobi' (1735), etc. He is best known by the two hymns to be found in Methodist hymn books, 'Behold the Saviour of Mankind' and 'O, Thou, Who, When I Did Complain.'

Wesley, Samuel, English hymn-writer, son of the preceding: b. Spitalfields, London, 10 Feb. 1691; d. Tiverton 6 Nov. 1739. He was head-master of Bundell's grammar school in Tiverton, in 1732-39. He did not embrace Methodism with his brothers, and wrote of it as "a spreading delusion." He was graduated from Christ Church, Oxford, in 1715, and took orders. He is best known by his hymns in the Methodist hymn book. Among the titles of individual

volumes by him were: 'Poems on Several Occasions' (1736); reprinted in 1808 and 1862; and 'The Christian Poet' (1735). Consult: Tyerman, *Life and Times*' (1866).

Wesleyan Methodists. See METHODISM IN AMERICA.

Wesleyan University, located at Middletown, Conn. It was established in 1831 under the auspices of the Methodist Episcopal Church, being the first educational institution of collegiate grade established by that church in the United States. The founders of the college were offered the buildings and site of the American Literary, Scientific and Military Institute, if an endowment of \$40,000 were raised; the gift was accepted and its conditions complied with. In 1868-78 the university's material resources were largely increased, and several new buildings erected; in 1872 women were admitted, and in the same year a new curriculum established with a wide range of electives; in 1900 the number of women admitted was limited to 20 per cent of the whole number of students in the preceding year. The university offers three courses, classical, Latin-scientific, and scientific, leading to the degrees of A.B., Ph.B., and B.S., respectively. In each of these courses the work of the first year is nearly all required; after the first year, the amount of required work is progressively diminished; a wide range of electives is offered, naturally limited to a certain extent by the degree to be obtained. Courses in graduate work are provided leading to the degrees of A.M. and M.S. There are five endowed scholarships, also the scholarships established by the trustees for the payment of the tuition of students considered worthy of such assistance. The students maintain an athletic association, a university glee club, mandolin and guitar clubs, and a number of the Greek letter fraternities; these latter have their own houses where many of the students live. Athletic sports are under the control of an athletic council on which undergraduates, alumni, and faculty are represented. The university has a campus of 14 acres on high ground overlooking the Connecticut River; the buildings include North College (the first building erected by the Military Academy), South College, the Judd Hall, the observatory, with a 12-inch equatorial telescope, Rich Hall (the library), the Wilbur Fisk Recitation Hall, and the Scott Laboratory of Physics, both erected in 1903, and the Fayerweather Gymnasium. The library in 1904 contained 63,000 volumes. In 1902-3 a movement was begun to raise \$1,000,000 to add to the endowment fund. The students in 1904 numbered 332, of whom 44 were women; the faculty numbered 36.

Wessel, vës'sel, Johann (surnamed GANSEFORT (Dutch, GOESEVORT), Dutch theologian: b. Groningen 1419 or 1420; d. 1480. He passed the latter part of his life in retirement in his native country, part of the time in convents. He was a decided opponent of the scholastic theology, and in intimate relations with some of the prominent humanists, as Agricola and Höck, yet in his own views leaned strongly toward mysticism. He regarded Christianity as something entirely spiritual, confined to a man's own heart and God. The Scriptures, according to him, are the living source of all true faith; the Church is based upon a compact; there is a

WESSEX — WEST BAY CITY

general priesthood of the rational universe; faith is to be reposed only in an orthodox pope, and not in every council; sin can be forgiven by none but God; excommunication has only an external influence; indulgences refer only to ecclesiastical penalties; the true satisfaction for sin is a life in God; and purgatory is nothing but the purifying influence of a longing after God. After his death some of his works were burned as heretical; his '*Farrago Rerum Theologicarum*' was published with a preface by Luther (1522). The most complete edition of his works is that edited by Lydius (1617). Consult Muusling, '*Commentatio Historica-Theologica de Wesseli*' (1831); Ullmann, '*Reformatoren vor der Reformation*' (1847).

Wessex, wēs'eks, England, a former kingdom, from the 6th to the 9th century, one of the most important of the Saxon heptarchy, and that in which the other kingdoms were ultimately merged in the reign of Egbert in 827. Wessex, signifying West Saxons, as an independent unit of the heptarchy, occupied a territory now comprised in Dorset, Wilts, and parts of Somerset and Hants. See **EGBERT**; **ENGLAND**.

West, Benjamin, American painter: b. Springfield, Chester County, Pa., 10 Oct. 1738; d. London 11 March 1820. After some instruction from William Williams, a Philadelphia painter, and having painted 'The Death of Socrates' for a gunsmith, he established himself as a portrait painter at Philadelphia at five guineas per portrait, and subsequently followed the same profession in New York. In July, 1760, he visited Rome, whence he proceeded to Florence, Bologna, Venice, and Parma. Returning to Rome, he painted 'Cimon and Iphigenia' and 'Angelica and Medora.' He was elected member of the Academies of Florence, Bologna, and Parma, and, visiting England in 1763, was so well patronized that he determined to make it his future residence. He executed a historical painting of 'Agrippina Landing with the Ashes of Germanicus,' for Drummond, archbishop of York, who introduced him to George III. The king became his steadfast patron, and gave him commissions for many years. In 1772 he was made historical painter to the king, in 1790 surveyor of the royal pictures. He was one of four selected to draw up a plan of the Royal Academy, was one of the original members, and there exhibited his 'Death of General Wolfe' (now in the Grosvenor gallery, London), in 1771. In this canvas West departed from the custom of the artists of the day of giving the characters Greek or Roman costumes. Reynolds, who had endeavored to dissuade him, later said, "I retract my objections. I foresee that this picture will not only become one of the most popular, but will occasion a revolution in art." Woollett's plate after this work had the largest sale of any engraving of modern times. West painted a series of historical works for Windsor, and for the chapel a series on the progress of revealed religion, divided into four series, antediluvian, patriarchal, Mosaic, and prophetic. On the death of Reynolds, in 1792, he was unanimously elected president of the Royal Academy. When George III. became insane the order for painting the religious series was abruptly recalled and the pay stopped.

West had finished 28 pictures, and sketched the entire series. He afterward painted a number of religious and historical pictures on very large canvases. Among them may be noticed 'Christ Healing the Sick' (in the National Gallery), the 'Crucifixion,' the 'Ascension,' and 'Death on the Pale Horse' (Pennsylvania Academy). The 'Battle of La Hogue' is among the best of his historical pieces. West's pictures numbered about 400. They are chiefly of heroic size, and display much inventive power and great skill in composition. But they are monotonously reddish-brown in coloring, and, despite their facility, lack spirit and imaginative value. His position in early American art has won for him a recognition somewhat in excess of his actual merit. Consult: Galt, '*Life and Studies of Benjamin West*' (1820); Tuckerman, '*Book of the Artists*' (1867); and various dictionaries of art.

West, James Harcourt, American publisher and Unitarian clergyman: b. Melrose, Mass., 13 Jan. 1850. He was educated at Tufts Divinity School, was engaged in printing and as a newspaper correspondent in 1873-84, and in 1884-94 was minister in charge of various Unitarian and Congregational Societies. He founded the 'New Ideal Magazine' in Boston in 1889 and has been engaged as a publisher since 1888. His writings include: 'Holiday Idlesse, and Other Poems' (1880); 'Uplifts of Heart and Soul' (1887); 'The Complete Life' (1888); 'Visions of Good—Poems of Freedom' (1892); 'In Love with Love' (1894); etc.

West, Thomas, BARON DELAWARR OF DEL-AWARE, English colonial governor of Virginia: b. 9 July 1577; d. at sea off the Atlantic coast of America 7 June 1618. He was educated at Queen's College, Oxford, in 1597 was returned to Parliament for Lymington, fought in the Low Countries and in Ireland, in 1609 became a member of the council of the Virginia Company, and in 1610 was made first governor and captain-general for life. On 10 June he arrived at Jamestown, where he soon restored order and comparative prosperity. He established a post at Riquotau (now Hampton), and built two forts. At the time of his coming want and mismanagement had almost compelled the settlement to disperse. By June 1611 he was again in England, where he printed a very favorable report as 'The Relation of the Right Honorable the Lord De-La-Warre.' In March 1618 he set sail once more for Virginia, but he died on the voyage. Consult Neill, 'The Early Settlement of Virginia' (1878); 'Proceedings of the Virginia Company' (Virginia Hist. Soc. 1888).

West Bay City, Mich., city on the Saginaw River, and on the Grand Trunk, the Michigan C., and the Detroit & M. R.R.'s; opposite Bay City and 12 miles north of Saginaw. It is connected with Bay City by several railroad bridges. It is in an agricultural region, and it has a number of industries connected with lumber products. The chief manufacturing establishments are flour mills, lumber and planing mills, sugar-beet factory, sash and door factories, chicory factory, and salt works. It has also shipyards, foundry, and machine shops. In 1900 (government census) the city had 121 manufacturing establishments, which were capitalized for \$2,323,910 and in which were 2,153

WEST BEND—WEST INDIES

employees whose annual wages amounted to \$868,504. The raw material used in the manufacturing cost, each year, \$2,294,668 and the value of the annual products was \$3,763,522. The city owns and operates the electric-light plant and the water-works. The educational institutions are a public high school, public and parish graded schools, and a public library. The two banks have a combined capital of \$100,000 and deposits amounting to \$618,920. Bay City and West Bay City are practically one in industrial and commercial affairs. The government of West Bay City is administered under a charter of 1897 which provides for a mayor, who holds office two years, and a council. Pop. (1890) 12,981; (1900) 13,119.

West Bend, Wis., city, county-seat of Washington County; on the Milwaukee River, and on the Chicago & Northwestern Railroad; about 35 miles north of Milwaukee. It is in an agricultural and stock-raising region. The chief manufactures are flour, beer, harnesses, spokes, hubs, and pocket-books. It has grain elevators, machine shops, foundry, and creamery. There are six churches, public and parish schools, and one bank. Pop. (1890) 1,290; (1900) 2,119.

West Bromwich, brūm'ich, England, a manufacturing town in Staffordshire, between Wednesbury and Birmingham. The principal buildings include the town-hall with a massive tower; a number of fine modern churches; several chapels of different denominations; public schools; an institute, art and technical schools, a free library, and a hospital. There is a fine public park. West Bromwich has a share in the mining and manufacturing industries of this busy district, and has grown largely of late years, carrying on the manufacture of iron goods of various kinds, smelting, brass-founding, etc. Pop. (1901) 65,172.

West Chester, Pa., borough, county-seat of Chester County; on the Wilmington & B. and the Philadelphia R.R.'s; about 27 miles west of Philadelphia. It was originally called Turk's Head, but in 1786 the county was divided, and the name was changed to West Chester when it was made the county-seat. The new county was called Delaware, but it retained the old county-seat, Chester.

West Chester has a number of manufacturing establishments, among which are carriage factories, creameries, sash and door factories, and manufactories of hosiery, umbrella tags, and wood products. The principal public buildings are the Chester County Hospital, the county court-house, prison, theatres, a large convent, and the municipal buildings. Marshall square contains a soldiers' monument and a handsome fountain. The educational institutions are a State Normal School, Villa Maria Academy, Friends' Select School, The Darlington Seminary, West Chester Business College, a public high school established in 1865, public and parish schools, a public library, a law library and three school libraries. There are eight banks; the three national and one of the state banks have a combined capital of \$650,000, and the five (national and state) have (1903) deposits amounting to \$2,864,050. Pop. (1890) 8,028; (1900) 9,524.

West Farnham, Canada. See FARNHAM.

West Ho'boken, N. J., town in Hudson County; adjoining Hoboken and near Jersey City; about one and one half miles from the Hoboken ferry on the Hudson River. It is on elevated land which rises somewhat abruptly from the land along the river at Hoboken. In 1900 (government census) the town had 177 manufacturing establishments, which were capitalized for \$4,042,373 and in which there were 3,028 employees, to whom were paid annually, \$1,248,244. The total cost of the raw material used annually was \$2,829,780, and the value of the finished products was \$5,491,760. The five silk factories were capitalized for \$3,327,900. They used annually raw material which cost \$2,117,267, and the value of the yearly products was \$3,961,054. The principal public buildings are Saint Michael's Monastery (Passionist Fathers) and the Dominican Convent. The educational institutions are a theological school, at the Monastery, for their own members, a high school established in 1897, public elementary schools, and two large parish schools. The Hudson Trust Company has a capital of \$500,000, and (1903) deposits amounting to \$8,500,000. Pop. (1890) 11,665; (1900) 23,049; (1903, est. Gov. Report) 26,523.

West Houghton, hō'tōn, England, a township in Lancashire, five miles west-southwest of Bolton, with manufactures of silk and cotton, and coal-mining. Pop. (1901) 14,377.

West Indies (more precisely, **WEST INDIAN ISLANDS**, the name "West Indies" having for centuries been employed to designate parts of the mainland as well, and being still so used by some good writers): the archipelago which includes the Bahamas and the Great and Lesser Antilles. The total land area is about 95,000 square miles—twice the size of New York; the islands are, however, dispersed far and wide over a region continental in size, which extends from lat. 10° N. to 28° N. and from lon. 58° W. beyond 85° W. For the geographical subdivisions of the main groups, see **ANTILLES** and **BAHAMAS**; for the geologic relations of some of them to the mainland portions of the Antillean continent, see **CENTRAL AMERICA** and **CARIBBEAN SEA**. It will presently be made clear that the resemblances between the islands are actually less marked than the differences, and it is obviously true that the latter are very much the more worthy to receive attention at a time when one island after another claims the sympathy of the world—and especially of the United States—on the ground that its conditions are exceptional; the reader is therefore referred to the separate articles **PORTO RICO**, **CUBA**, **SANTO DOMINGO**, **DOMINICAN REPUBLIC**, **JAMAICA**, **MARTINIQUE**, **DOMINICA**, **GRENADA**, **GUADELOUPE**, **BARBADOS**, etc., in which the characteristic features of each are mentioned, though briefly. The distinctions cannot be quite fairly or helpfully presented in any other way, since every important insular community must eventually form the subject of a separate study.

To pass from a western to an eastern point in this archipelago, one may be obliged to sail about 2,000 miles; and to pass from its northernmost to its southernmost island one must sail more than 1,500 miles. This wide dispersion is the fact which should be first noted. The next step is to realize fully the disjunctive political conditions, the results of the distribu-

WEST INDIES

tion of the islands among a number of competing nations. Let us now consider the political subdivisions. The British possessions are: The Bahamas, including 20 inhabited and many desert islands; Jamaica, with dependent Cayman Islands, etc.; Windward Islands, including Grenada (the governor's residence), Saint Lucia, Saint Vincent and the Grenadines; Barbados, east of the Windward Islands; Leeward Islands, comprising Antigua (seat of the government of the colony), the Virgin Islands, Saint Kitts (Saint Christopher), Nevis, Anguilla, Dominica and Montserrat, and Trinidad and Tobago, near the South American coast. The annual value of the exports from the British West Indian Islands is about \$31,500,000 (approximate average for the years 1899-1901), and of their imports about \$34,000,000; revenue and expenditure (exclusive of parliamentary grants) each being about \$10,000,000 annually during the same period of three years. The Danish possessions are the small islands of Saint Thomas, Saint Croix or Santa Cruz and Saint John, with total area 138 square miles, population 120,892 (in 1901), and foreign trade about \$30,000 in the same year, imports being valued at a little more than exports. A treaty for the sale of these islands to the United States was signed 24 Jan. 1902, and rejected by the Danish Landsting 22 October next following. French possessions are: Guadeloupe and its dependencies, and Martinique, their total area being about 1,068 square miles and total population about 360,000, combined exports about \$8,500,000 and imports about \$9,500,000. A French and Dutch possession is the island of Saint Martin, 38 square miles in area, of which it has been well said: "The political complexion of Saint Martin is peculiar. Seventeen square miles of the northern section belong to France and the rest to Holland, while the settlers, largely blacks, are principally British, who outnumber both the Dutch and French. About 3,000 of the inhabitants are in the French portion of the island, and 5,000 in the Dutch" (Hill's 'Cuba and Porto Rico,' etc.); furthermore, "each maintains an administrative force as large as that of the State of Texas." The Dutch possessions—fragments on opposite sides of the Caribbean Sea—are the islands of Curaçao, Aruba, Bonaire or Buen Ayre, Saint Eustache, Saba and part of Saint Martin, as just stated. Venezuelan possessions are some of the islands, not appropriated by the English or Dutch, in the east-and-west line between Trinidad and the Gulf of Maracaibo. The list is completed by adding Cuba, a republic, subject in certain matters to the control of the United States: Porto Rico, with the small neighboring islands, a possession of the United States; and the Isle of Pines. Mr. Hill's observation in 1898 was that, "As we sail down the eastern islands, hardly a score in number . . . we find five foreign flags and no less than a dozen distinct colonial governments . . . with no shadow of federation between them, or even co-operation of any kind." For example, Dominica, though lying between Guadeloupe and Martinique, and within sight of both, is commercially farther from them than from England, because it is cut off from the French neighbors by tariff and quarantine laws.

Edwards, in his history of the British West Indies, says that the "state of the population" in the islands which he described in 1791 was as follows: Whites, 65,305, and blacks, 455,684.

The proportion of Caucasians has decreased owing to causes mentioned in the articles JAMAICA, etc. The principal attraction of these islands for immigrants from Great Britain and white residents (what there was left of it after the manumission of the slaves which was completed in 1838) ceased when the cane-sugar industry became unprofitable; an economic tendency which has so increased that between 1899 and 1903 loans or subventions amounting to more than \$4,600,000 have been provided by the British Parliament for the benefit of the dependent islands generally or specifically for the sugar producers. To speak of this as a new or temporary crisis is absurd: it is an old story. Anthony Trollope, when he wrote of 'The West Indies and the Spanish Main' in 1859, said: "That Jamaica was a land of wealth, rivaling the East in its means of riches, nay, exceeding it as a market for capital, as a place in which money might be turned; and that it now is a spot on the earth almost more poverty-stricken than any other—so much is known almost to all men." Now, such distress, long-endured and notorious, has more or less discouraged immigration, commerce, and other influences that make for uniformity in population, manners and usages. Mr. Hill's assertion that "each of these islands is breeding a different species of mankind" may seem at first view rather extravagant; but when we reflect that geography, politics and poverty combine to isolate and segregate those communities, we shall regard the following statements as decidedly moderate: "The West Indian people represent many original stocks, which have developed variations of habits and customs in their New World environment. They are practically divisible into three great races, the white, colored and black, modified by Spanish, English and French civilizations." The influence of the aboriginal stock should by no means be overlooked (see CARIB, PORTO RICO, CUBA, etc.), nor can we regard that of the Dutch and Danes as a negligible quantity. Mr. Hill writes: "In the countries in which the French race habit has been implanted, Haiti, Martinique and Guadeloupe, there has resulted a more complete elimination of the Caucasian type than in either the English or (until 1898) Spanish islands. . . . The black races of the West Indies and their habits are most interesting studies. Gathered as they were from numerous tribes of Africa, and settled upon the different islands, they naturally show not only differences in inherited qualities, but in those habits acquired from different masters for which the African is noted. Thus there are English, French, Spanish, Irish, Scotch and Dutch negroes in the various islands." Again, differences in topography, soils, flora and climate, which, as we have said, require separate studies, have been summarized most intelligently by Mr. Hill, who writes: "These islands, far from being alike in natural features and economic possibilities, present great extremes. Some are low, flat rocks barely peeping above the sea; others gigantic peaks rising straight to the clouds, which perpetually envelop their summits; others are combinations of flat and rugose types. Some present every feature of relief configuration that can be found within a continental area—mountains, plains, valleys, lakes; some are made up entirely of glaring *white* coral sand or reef rock; others are entirely composed of *black* volcanic rock, and still others are a com-

bination of many kinds of rocks. Many are as arid as a western desert and void of running streams, and others have a most fertile soil, cut by a hundred picturesque streams of living water, and bathed in perpetual mist and daily rainfall. Some are bordered only with the fringing salt-water plants or covered with thorny coriaceous vegetation; others are a tangled mass of palms, ferns and thousands of delicate, moisture-loving plants which overwhelm the beholder with their luxuriance and color. Some are without human habitants; others are among the most densely populated portions of the world" (for example, Barbados: 1,120 to the square mile). "The diverse configuration produces climatic differences, and each kind of rock weathers into its peculiar soil. . . . Some of these islands, through possibilities of a diversified agriculture and hygienic condition, are adapted to higher civilization, and others, either through sterility or ruggedness of relief, are capable of supporting only inferior races." The total number of inhabitants is approximately 5,100,000.

Finally, it is important to suggest modifications of an impression, created by publications which were widely circulated in 1903, to the effect that West Indians are all anxious to emigrate; that "every family has a son or daughter in the United States, or one saving up money with the idea of going there and making a fortune"; and that the threatened exodus from the archipelago is a new manifestation. The foregoing considerations make it clear that every sweeping generalization of this kind must be more or less misleading. And, further, we should realize that a similar phenomenon has been observed at short intervals during four centuries; that there has nearly always been a tendency toward exodus from some of the islands; that, for example, it was observed in the 16th century, when the treasures of Mexico and Peru were discovered, and the Spanish authorities found themselves fairly compelled to decree that every attempt to desert the island of Hispaniola (Santo Domingo) was an offense punishable with death. Discontent will undoubtedly continue until the archipelago as a whole regains a moderate degree of prosperity, and the inhabitants shall be free to move about among the islands, seeking employment or adventure wherever such things are offered.

Consult, beside the works already mentioned, the writings of Agassiz, Humboldt, Schomburgk, Froude, Fiske, and Mahan; for descriptions of scenery, etc., Kingsley and Hearn; for the old form of rivalry in regard to control in West Indian waters, the Earl of Leicester's personal narrative, 'The voyage of Robert Dudley, afterward styled Earl of Warwick and Leicester and Duke of Northumberland, to the West Indies in 1594-1595'; also Griffin, 'List of books, with references to periodicals on the Danish West Indies': Washington, 1901.

MARRION WILCOX,
Authority on Latin-America.

West Pittston, Pa., borough in Luzerne County; on the Susquehanna River, opposite Pittston. Two bridges span the river and connect the borough with the city. It is mainly a residential borough, many of the men who do business in Pittston have their homes in West Pittston. In 1900 (government census) West Pittston had 35 manufacturing establishments which were capitalized for \$567,287 and whose

output each year was valued at \$621,996. Pop. (1890) 3,906; (1900) 5,846.

West Plains, Mo., city, county-seat of Howell County; on the Kansas City, Fort Scott & Memphis Railroad; about 125 miles south of Jefferson City. It is in a region where there are farming, fruit-growing, and lumbering interests. The city ships large quantities of apples, grapes, dairy and farm products, and lumber products. The two state banks have a combined capital of \$55,000. Pop. (1890) 2,091; (1900) 2,902.

West Point, Ga., city in Troup County; on the Chattahoochee River, and on the Atlanta & W. P., and the Western of Alabama R.R.'s; about 85 miles southwest of Atlanta. It is in an agricultural region in which cotton is one of the chief products. It has cotton gins, cotton-seed-oil mills, cotton factories, an iron foundry, and a machine shop. It has one bank which has a capital of \$75,000. During part of the Civil War it was a supply depot for the Confederate army. Pop. (1890) 1,254; (1900) 1,797.

West Point, Miss., town, county-seat of Clay County; on the Mobile & O., the Southern, and the Illinois C. R.R.'s; about 95 miles north of Meridian. It was founded in 1857. It is in an agricultural region in which cotton is one of the principal products. The chief industrial establishments are wagon and carriage factories, foundries, machine shops, brick and tile works, lumber mills, sash, door and blind factories, ice factory, milling and ginning establishment, and manufactories of electro-light dynamos. It has six churches, the West Point Military Academy, the Southern Female College, and elementary schools. There is a national bank which has a capital of \$75,000. Pop. (1890) 2,762; (1900) 3,193.

West Point, Neb., town, county-seat of Cuming County; on the Elkhorn River, and on the Fremont, Elkhorn & Missouri Valley Railroad; about 36 miles northwest of Fremont and 75 miles northwest of Omaha. It is in an agricultural region, in which the chief products are wheat and corn. It has a flour mill, creamery, grain elevator, carriage and furniture factories, stock-yards, and coal and lumber yards. The two national banks have a combined capital of \$100,000, and the state bank has a capital of \$30,000. There are a high school and graded schools and a school library. Pop. (1890) 1,842; (1900) 1,890.

West Point, N. Y., United States military post, Orange County; on the west bank of the Hudson River, on the New York, O. & W., and the West Shore R.R.'s, and connected by ferry with the New York Central; 50 miles north of New York. It is also a stopping point for the Hudson River daily steamers. Its site is very picturesque, the eastern end of the point slopes abruptly to the river, on the northern side the slope is more gradual, to the northwest are Crow Nest and Storm King. The government reservation contains 2,330 acres, 2,100 of which were acquired in 1790. It was occupied as a military post by the Americans during the Revolution and was strongly fortified. A part of the fortifications consisted of a strong chain stretched across the river to Constitution Island to prevent British vessels ascending the river. It was for a time Wash-

WEST POINT—WEST VIRGINIA

ington's headquarters; and in 1780 was under the command of Benedict Arnold (q.v.) whose plan to betray it to the enemy was frustrated by the capture of André (q.v.). West Point was occupied as a military post after the Revolution, and a military school was established there as early as 1794; in 1802 the Military Academy was organized, and West Point designated as the site. See MILITARY ACADEMY, UNITED STATES.

West Point, or Eltham's Landing (Va.), Engagement at. When Yorktown (q.v.) was abandoned, 4 May 1862, it was intended by Gen. McClellan that Franklin's division, followed by Sedgwick's, Porter's, and Richardson's, should be moved in transports up York River to a place opposite West Point and, striking across to the main roads, cut off the retreat of such bodies of Gen. J. E. Johnston's army as might be below, making their way to New Kent Court House. But the day before the evacuation of Yorktown Franklin had received permission to land his men, who had been on the transports several days, and it was not until the morning of the 6th that he could get them on board again and ready to sail. About 1 p.m. that day he arrived at Eltham's Landing, above West Point, landed his men and sent the transports back for Sedgwick's division. He had no instructions except to wait for orders. The division was first encamped on a plain beyond which was high wooded ground, over which ran a road from the landing to Barhamsville and thence toward New Kent Court House. Franklin proceeded to occupy the wood. Newton's brigade was put in position on both sides of the road leading to Barhamsville. Parts of Taylor's and Slocum's brigades were on Newton's left; two batteries were in his rear, and two regiments of Taylor's brigade were in reserve. Next morning Dana's brigade of Sedgwick's division continued the left of the Union line back to the river. The presence of Franklin threatened the road through Barhamsville toward New Kent Court House, on which part of the Confederate army was retreating from Yorktown and Williamsburg, and under Gen. Johnston's orders Whiting's and Hampton's brigades had been put in position to protect the road. On the morning of the 7th, soon after Dana's brigade had come up, Whiting was ordered to advance and drive Franklin back to his landing-place. His skirmishers went forward and encountered those of Newton, and closely following came Hood's Texas brigade and Balthis' Virginia battery, supported on the right by two regiments of Wade Hampton's brigade. Newton's skirmishers were driven in and closely followed, then Newton threw forward two regiments, which were driven back, and the entire line was forced out of the wood. On Hood's right Whiting's brigade protected that flank, while on his left S. R. Anderson's Tennessee brigade had come up, and by noon Franklin had been pushed back under cover of the gunboats. The Confederates then attempted to shell the transports in York River, but the range was too great, while the fire from the Union gunboats was effective, and compelled the Confederates to withdraw about 3 p.m., and resume their position near Barhamsville. Franklin's troops resumed their former position. The Union loss was 48

killed, 110 wounded, and 28 missing; the Confederate loss, 8 killed and 40 wounded.

E. A. CARMAN.

West Point Military Academy. See MILITARY ACADEMY, UNITED STATES.

West River, China. See SI-KIANG.

West Rutland, Vt., town in Rutland County; on Otter Creek, and on the Delaware & Hudson Railroad; about 55 miles southwest of Montpelier, the capital of the State. In 1887 it was set off from Rutland (q.v.) and organized as a separate town. The principal marble quarries, for which this region is famous, are in West Rutland. It has seven churches, graded schools, and a library. It is one with Rutland except in government. Pop. (1890) 3,680; (1900) 2,914.

West Springfield, Mass., town in Hampden County; on the Connecticut River, and on the Boston & Albany Railroad; opposite Springfield. It was settled about 1655 and at first was a part of Springfield. In 1774 it was incorporated. It is mainly a residential town, many of the business men of Springfield have their homes here. There are several industrial establishments, chief of which are paper mills, railroad repair shops, and machine shops. Many of the people are interested in market gardening. The public library has about 8,000 volumes. Pop. (1890) 5,077; (1900) 7,105.

West Troy, N. Y. See WATERVLIET, N. Y.

West Union, Iowa, city, county-seat of Fayette County; on the Chicago, M. & St. P. and on the Burlington, C. R. & N. R.R.'s; about 85 miles northwest of Dubuque. It is in an agricultural and stock-raising region. It has large creameries, flour mill, and stock-yards. There are three banks which have a combined capital of \$180,000 and (1903) deposits amounting to \$411,760. Pop. (1890) 1,676; (1900) 1,935.

West Virginia, a state lying mainly on the western slope of the Appalachian Mountains; it was admitted to the Union 19 June 1863; area, 24,780 square miles, of which 135 square miles is water surface. The State lies between lat. 37° 6' and 40° 38' N., and lon. 0° 40' and 5° 35' W. from Washington. It is bounded on the north by Ohio, Pennsylvania and Maryland; on the east by Pennsylvania, Maryland and Virginia; on the south by Virginia and Kentucky; on the west by Kentucky and Ohio. The boundary is 1,170 miles in length and very irregular. Capital, Charleston, in Kanawha County.

Topography.—Though lying for the most part west of the Alleghany Mountains, West Virginia is not a geographic unity. With a general slope to the northwest, the surface of the State is broken into three great inclined planes, sloping from Spruce Mountain in Pendleton County to the east, to the north, and to the south. On the eastern and western sides there are broad valleys, which narrow into ravines as the upland hill region is approached. In the eastern part of the State are parallel ridges of mountain ranges, separated from each other by longitudinal and transverse valleys. The average elevation of West Virginia is greater than that of any other State east of the Mississippi River, being 1,500 feet; Pennsylvania is next with an average elevation of 1,100 feet. But in the alti-

WEST VIRGINIA

tude there is a vertical range of 4,600 feet, from 260 feet above the sea at Harper's Ferry to 4,860 feet at the top of Spruce Knob, in Pendleton County. The great range of altitude is equivalent in influence upon climate to a range of latitude of 15°, though the real range is 3.5°. Within the borders of the State, therefore, may be found the climate and products of South Carolina, Virginia, New England and Canada. In some parts of the State there has been frost in June; in Hampshire and Tucker counties are places where ice and frozen soil may be found all summer in the dense laurel thickets and spruce forests. The county of highest average elevation is Pocahontas; a very large area of the State lies above 2,000 feet; more than half lies above 1,500 feet, hence the principal industries of the higher regions are stock-raising, lumbering, and mining, since successful agriculture requires an elevation of less than 1,500 feet. The lowest depression west of the mountains is at Kenova, near the mouth of the Big Sandy River, 500 feet above the sea. Other elevations are: Bald Knob, Pocahontas County, 4,800 feet; High Knob, 4,710 feet, and Elkins, 1,922 feet, in Randolph County; Bayard, Grant County, 2,000 feet; Morgantown, Monongalia County, 901 feet; Parkersburg, on the Ohio River, 638 feet; Wheeling, in the Panhandle, 645 feet; Lewisburg, in Greenbrier County, 2,200 feet. The great range of altitude has many advantages: it gives abundant water power on all streams; it drains the mines of water and gas, and carries the coal from the mines, and stone from the quarries to the cars and to the boats—all by gravity. In this it has the advantage over the foreign coal fields and over all other American coal fields except those of Pennsylvania.

Climate and Rainfall.—West Virginia has perhaps the greatest diversity of climate of any State, caused by the numerous mountain ranges and the great variation in altitude. The country lying on the eastern slopes of the Alleghany Mountains has the warmer and drier climate. In the mountains a Canadian climate prevails both summer and winter. In the eastern and southern parts of the State are found sections where the winters are mild and the summers very warm. In the coldest regions the mercury sometimes falls to 30° below zero in winter, while in the warmest portions it sometimes rises to 96° above. In the northern part of the State at Morgantown the mean winter temperature ranges from 34° to 37°; the mean summer temperature, 70° to 75°. In the southern part of the State the average is 3° to 5° higher. The mean annual of the State is 54.4°. The date of the last killing frost in the northern part is about 15 April; of the first killing frost, about 15 October. The average yearly rainfall including melted snow is 44.2 inches. The average is greater on the western slope of the Alleghanies than on the east, and greatest near the summit of the mountains. The rain clouds on the east come from the Atlantic; those on the west from the Pacific, modified by warm winds from the Gulf and cold ones from the northwest. The depth of the snowfall varies greatly with locality and altitude, from a few inches in the warmer regions to six or seven feet near the tops of the mountains.

River System.—The Alleghany watershed is in the eastern portion of the State, all except

eight of the counties lying on the western slope within the Ohio Basin. In the higher part of the State, where Pendleton, Pocahontas, and Randolph counties join, five rivers rise which flow across the State—two finally flowing eastward into the Atlantic, and three westward into the Ohio. The Ohio forms the western boundary and is navigable throughout its length. The eastern part of the State is drained by the Potomac and its tributaries. The Cheat and Monongahela flow through the northern counties, and the latter is now navigable as high up as Fairmont in Marion County. The Greenbrier and the Elk flow from the watershed to the southwest and join the Great Kanawha, which flows northwest into the Ohio. The Great Kanawha is navigable for 90 miles from the Ohio. The Big Sandy, flowing northwest, forms the southern boundary of the State. The river system of the State has been improved somewhat for navigation by the government engineers, but the interior rivers will always be more valuable for their water power than for facilities of navigation.

Geology, Mineral Resources, and Mining.—Beginning in the east with the oldest and lowest rocks, the first formation of importance is the Shenandoah or Trenton limestone, extending across Jefferson County and the eastern part of Berkeley County. It stands at an angle of 30° to 35°, is several thousand feet thick, produces a valuable commercial lime, and underlies the best farm lands of the State. In this region are the cities of Charles Town, Shepherdstown, and Martinsburg. The next important formation to the west is the indestructible Medina sandstone, a great mountain maker. It is seen in Mineral and Pendleton counties. Above the Medina sandstone is the Lewiston or Helderberg limestone in Mineral, Hampshire, Hardy, Grant and Pendleton counties. This limestone is valuable for cement and for fertilizing purposes. Resting upon this is the Monterey or Oriskany sandstone, a coarse, friable rock, producing after disintegration a barren soil. It is seen in Mineral and Morgan counties and as far south as Pocahontas. From it is obtained glass sand and material for silica brick. Next above to the west are the Hamilton shales in Randolph, Pocahontas, Greenbrier and Monroe counties. This is the region of the mineral springs, and summer resorts. The mountain limestone begins in Monongalia County, a thin, narrow formation, and thickens and widens toward the southern part of the State. The last formation of importance before the carboniferous measures is the Great Conglomerate or Millstone Grit, extending across the centre of the State. The western two thirds of the State is formed principally of coal measures made up of alternating layers of shales, sandstones, fire-clays and coal seams. Thus there are in the State three limestones of value, and three sandstones. Peat is forming in the shady swamps of the cold uplands of Preston, Tucker, Grant and Randolph counties.

West Virginia has no gold, silver, or other of the valuable metals, but is rich in the common minerals. Of these coal is the most important. The Appalachian coal fields, extending from northern Pennsylvania to western Alabama, extend from the north to the southwest through the entire length of the State, and here the coal fields are at the broadest extent, the average

WEST VIRGINIA

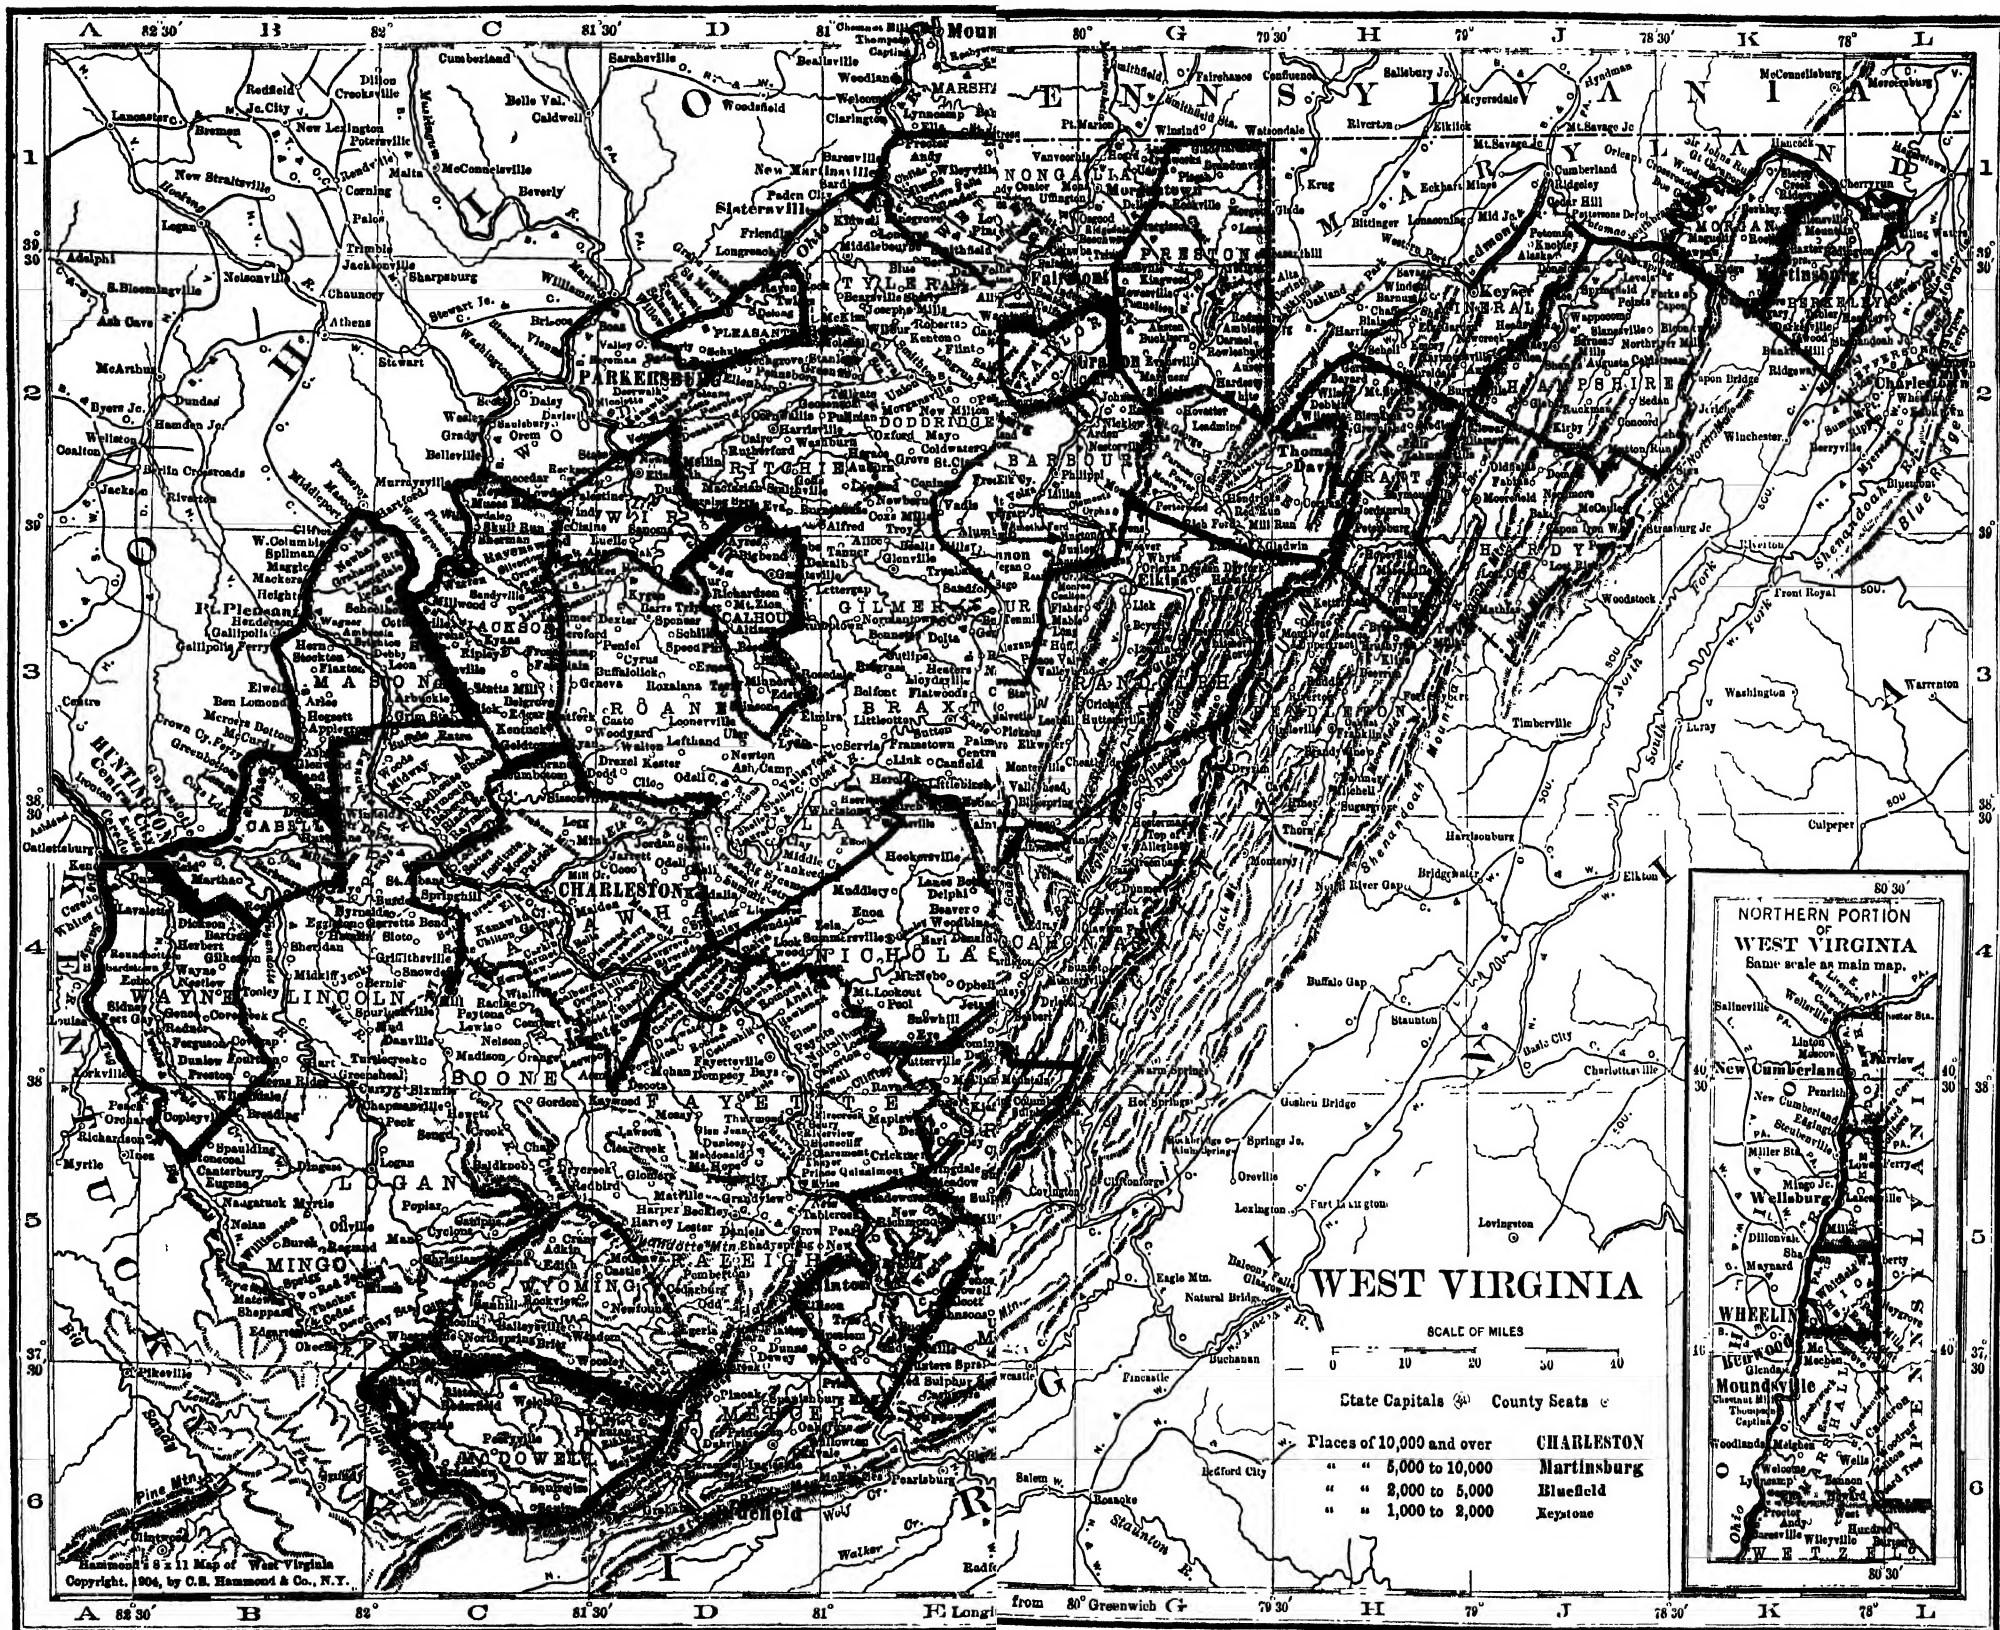

width being about 100 miles and the average length 150 miles, thus giving about 15,000 square miles of coal lands, of which 10,000 to 12,000 will be productive. There are three distinct parallel areas of distribution of coal deposits: (1) the New River—Pocahontas coal in the southwestern part of the State, extending from Randolph County southwest to McDowell County, and underlying ten counties; (2) the Alleghany-Kanawha coal measures underlying 17 counties and extending across the State through the central part from Preston County to Mingo, gradually widening toward the southwest; (3) the Pittsburg coal is found in the northwestern part of the State from Braxton County to Monongalia and Hancock counties, underlying 15 counties. In the extreme northeast, in Morgan and Berkeley counties, some anthracite coal is found, but it is not profitable for mining. At present coal mining is carried on in four principal districts, two in the northern and two in the southern part: (1) Fairmont or Upper Monongalia district, which produced in 1901 5,174,160 short tons, and to which the Baltimore & Ohio railroad furnishes transportation; (2) the Elk Garden or Upper Potomac district, opened by the Baltimore & Ohio and the West Virginia Central and Pittsburg railroads, which produced 1,856,677 short tons in 1901; (3) the Pocahontas or Flat Top district in the southeast, on the Norfolk & Western railroad, producing in 1901, 6,736,107 short tons; (4) the New and Kanawha rivers district, producing in 1901, 8,036,292 short tons of coal, which was sent to market over the Chesapeake & Ohio railroad and the Kanawha River. The coal production in 1880 was 1,568,000 tons; in 1890, 7,394,654 tons; in 1900, 22,647,207 tons; in 1903, 25,760,000 tons. West Virginia is second only to Pennsylvania in the coal production. In 1903 there were 479 coal mines in operation in 26 counties, as follows: Fayette, 104; McDowell, 59; Marion, 24; Kanawha, 85; Harrison, 45; Tucker, 8; Mercer, 13; Mineral, 10; Mingo, 35; Preston, 18; Taylor, 10; Barbour, 13; Putnam, 4; Marshall, 5; Ohio, 6; Randolph, 7; Raleigh, 16; Mason, 10; Monongalia, 6; Hancock, 4; and Brooke, 7. Five other counties have from one to five mines each. About ten counties not in the above list produce small quantities of coal. West Virginia coal is especially good for coking purposes, and in nine counties—McDowell, Fayette, and Tucker leading—are large coking establishments. In 1902, 3,750,000 tons of coke were produced, valued at \$4,000,000. In 1901, 403 electrical machines were used in coal mines, reducing labor to the equivalent of 4,817,943 tons. The average wage of a miner is \$52 per month. It is a significant fact that the amount of coal consumed within the State, excluding that used by transportation agencies, is very small, most of it being shipped from the State. Manufactures are not sufficiently developed to use large quantities of coal, and besides natural gas is used instead of coal in many establishments, and most of the railway companies are connected with the mining interests and encourage the long freight hauls. Metallic ores are not found in paying quantities. The value of the building stone, principally limestone and sandstone, quarried in 1901, was \$106,710; the value of the salt produced—231,722 barrels—was \$94,732. Valuable deposits of lime are found in Jefferson, Berkeley, Hampshire, Hardy, Greenbrier and

Monroe counties. Numerous mineral springs, well known as health and pleasure resorts, are found in Greenbrier, Monroe, Summers and Hampshire counties. The State owns Berkeley Springs in Morgan County, and Capon Springs in Hampshire County, through the bequest of Lord Fairfax, who left them to the people of Virginia forever.

Oil and Gas.—Both petroleum and natural gas are found in immense quantities in the northwestern section of the State. The development of both is drifting toward the Kanawha Valley. The counties producing the greater part of the oil and gas are Ritchie, Wood, Wirt, Gilmer, Roane, Kanawha, Cabell, Lewis, Pleasants, Doddridge, Harrison, Tyler, Marion, Wetzel, Monongalia, Marshall and Hancock. The gas produced in 1901 was worth \$3,954,722, in 1902, \$5,390,181. It is conveyed by pipe lines to the principal cities of the State, to Cleveland, Pittsburg, and to other cities in adjoining States. In the production of crude petroleum West Virginia now ranks first of the States, producing in 1902, 22,000,000 barrels, valued at about \$25,000,000. Most of the oil is piped to Philadelphia and Baltimore.

Agriculture, Horticulture, and Stock Raising.—The total value of farm property in West Virginia in 1900 was \$203,907,349, of which amount \$168,295,670 represented the value of the 92,874 farms; \$34,026,560, the value of the buildings, and \$134,269,110, the value of the land and other improvements; farm implements and machinery were worth \$5,040,420; live stock \$30,571,259. The total value of the farm products was \$44,768,979, of which amount animal products were worth \$19,073,790, and crops, \$25,696,189,—more than twice the valuation in 1890. The gross farm income was \$36,608,110; the net income cannot be ascertained. The total land area is 15,772,800 acres, of which 10,654,513 are in farms. From the northeast corner of the State extending south and southwest to the Big Sandy River the country is mountainous with narrow valleys. There are no transportation soils, all being from disintegration of limestone, sandstone, or mixtures of shales and clays. The soil is generally fertile and does not wash into gullies, and the land is productive to the tops of the mountains. Clay soil is found in some of the higher portions, alluvial soil in the upland valleys, and unproductive sandy soil in the northeast. In the extreme northeastern counties the soil is of rich limestone. West of the mountains the broad flat hills furnish grazing for cattle, while the valleys produce good crops. The surface near the Ohio River is gently rolling and the soil—clay and sand loams—is rich. The average size of the farms is gradually decreasing and now ranges from 72 acres in Clay County to 305 in Hardy, the general average being 115, and the average value being \$1,446. The largest farms are found in the grain and stock-raising counties. White farmers (92,132) conduct 99.2 per cent of the farms, and 77 per cent of them own in whole or part the land they cultivate; 72 per cent of the colored farmers own in whole or part the land they cultivate. The average value of the negro farm is about half that of the white, and the average gross income about half as much. There are only 614 farms of 1,000 acres and over, most of them ranging from 50 to 90 acres.

On most of the farms the principal source of

WEST VIRGINIA

income was from stock-raising; hay and grain furnished the next most important source. Of live stock, horses, cattle, sheep, hogs, poultry and mules were valued in the order named. The value of animals sold and slaughtered was \$9,428,066; dairy products, \$5,088,153; poultry and eggs, \$3,721,427; wool, \$636,012. The principal crops and their values in 1900 were corn, \$7,698,435; hay and forage, \$5,517,073; wheat, 3,040,314; forest products, \$2,632,980; orchard fruits, \$2,155,509; potatoes, \$1,133,381. The largest corn growing counties are Wayne, Kanawha, Jackson, and Mason, in the Kanawha Valley; Jefferson, Berkeley and Mason lead in the production of wheat; Hampshire, Hardy and Morgan in rye; and Preston in oats and buckwheat. Orchard fruits, principally apples, peaches, cherries, pears, plums and prunes are raised in Randolph and Mineral counties. The largest orchard in the Middle West is in Randolph County, containing 1,740 acres and 200,000 trees. Small fruits (berries) are raised in Brooke, Harrison, Ohio, and Wood counties; tobacco in Lincoln, Putnam and Cabell counties. The average expenditure on each farm for labor is \$22, which shows that the West Virginia farmer does most of his own work. The amount expended for fertilizers is very small, only \$4 per farm. The United States Agricultural Experiment Station is located at Morgantown and is conducted by the State University.

Timber.—There are 15,000 square miles of timber lands in the State, about 74 per cent of the total area. The largest hardwood mills in the world are in Pocahontas, McDowell and Randolph counties. The production in 1903 was: poplar, 180,000,000 feet; spruce, 75,000,000 feet; oak, 50,000,000 feet. There are large forests of white pine in the upland regions which have not been touched by the lumberman. The densest forests are in the eastern and southern counties. The principal trees of value found in the State are oak, both red and white, and chestnut, hickory, locust, maple, poplar, birch, hemlock, white pine, and spruce. The lumbering industry is rapidly increasing in importance as the interior of the State is opened up by railroads.

Manufactures.—In 1900 there were in West Virginia 6,301 manufacturing establishments, with a total capital of \$56,208,064, employing 33,294 persons. The total wages paid amounted to \$12,894,859, and the gross value of the products was \$74,598,445. Manufactures are located principally in the northern part of the State and along the Ohio River, which forms the western boundary. The 12 counties along the river furnish 59 per cent of the manufactures; the four Panhandle counties alone furnish 44 per cent. The localization of the manufactures is due to the shipping facilities offered by the Ohio River and to the local supply of natural gas and coal. About 31 per cent of the manufactures are found in the six cities of Wheeling, Parkersburg, Martinsburg, Huntington, Charleston and Benwood. The following are the most important manufacturing counties, each producing over a million dollars' worth: Ohio, Marshall, Wood, Kanawha, Cabell, Tucker, McDowell, Berkeley, Fayette, Randolph, Marion, Morgan, Mineral, Jefferson, and Grant. The manufacture of iron and steel is the most important of the manufacturing industries,—11 establishments employing 4,467 men, with an output valued at

\$16,514,212. The iron and steel industry is at present confined to Wheeling and vicinity and Parkersburg. The next important industry is the manufacture of lumber products, with 950 establishments, 5,327 wage-earners, and products valued at \$10,612,837. The industry third in rank is flour and grist milling, with 737 mills, 314 employees, and products worth \$5,541,353. West Virginia ranks next to Pennsylvania in the amount of coke produced. In 1900 there were 77 coke producing plants, with 3,131 employees and products valued at \$3,529,341. The United States Steel Corporation is erecting one of the largest plants in the world near Welch in McDowell county. When finished it will employ 10,000 men, and will have the largest coke producing plant outside of Pennsylvania. The leather industry employs 664 men in 46 establishments, and the products are valued at \$3,210,753. The oak and hemlock forests near at hand furnish an abundant supply of tanbark. The largest production of leather is in the eastern and northern counties. Glass manufacture is a rapidly growing industry, having 16 factories in 1900 with an output valued at \$1,871,895, and has quadrupled since that time. In the census reports for 1900 about 100 other industries are listed. All manufactures are rapidly expanding, especially the production of glass, steel, and coke. From 1890 to 1900 the value of manufactured products increased 117 per cent; from 1900 to 1903 it is estimated that there has been a further increase of 40 per cent.

Railroads.—There are more than 3,500 miles of railway in operation in the State. The principal lines are the Baltimore & Ohio, extending across the northern part of the State, besides numerous important branches covering most of the western part of the State; the Chesapeake & Ohio, crossing the southern part of the State along the Kanawha Valley from White Sulphur Springs to Kenova; and the Norfolk & Western, with four branch lines along the Big Sandy Valley in the southern part of the State from Wills to Kenova. The Wabash has surveyed a route and will build a road across the State from north to south. Other shorter railroads are: The West Virginia Central & Pittsburg, with main line from Cumberland to Harding, and five branch lines; the Kanawha & Michigan, the Pittsburg, Wheeling & Kentucky, the Dry Forks Railway, the Guyandotte Valley, the Charleston, Clendinning and Sutton, and several other short lines, besides a number of completed and partial surveys. About 1,500 miles of new road were being surveyed or were in process of construction in 1904. The Baltimore & Ohio and the Chesapeake & Ohio lines have in recent years absorbed numerous short lines within the State. The great production of coal, coke and lumber demanding transportation encourages the rapid development of the railroads.

Finances.—The State has no debt, having refused to assume any of the debt of Virginia; the tax rate is 25 cents on \$100 for State purposes and 10 cents for school purposes. The receipts for the year ending 30 Sept. 1902 amounted to \$2,348,987.89. The disbursements were \$2,292,533.86. The State had in stocks and bonds and investments \$650,336.44. The unused funds of the State are deposited with 63 state banks and draw 3 per cent interest. The chief sources of income in 1902 were: licenses, \$324,321; corporation license tax, \$399,845; railroad taxes,

WEST VIRGINIA

\$101,321.45; interest on deposits and securities, \$72,675; fines, etc., \$29,324.42; poll taxes, \$163,415.75; land tax, \$298,875.25; buildings on land, \$45,254.20; lots, \$42,109.50; buildings on lots, \$89,340.54; intangible personal property, \$140,250.15; tangible personal property, \$75,890.90.

Banks and Banking.—In November 1903 there were 148 state banks in West Virginia, an increase in one year of 33 banks; 68 national banks, an increase of 13 over the year before; 5 private banks and one savings bank. In 1893 there were only 55 state banks. The state banks have (1903) a paid up capital stock of \$7,731,510, an increase within the year of more than two and a half millions. The deposits in the state banks for 1902 amounted to \$32,872,669.70, and for 1903, to \$38,908,768.65; the total resources for 1902 amounted to \$42,735,099.93; and for 1903 to \$53,481,750.14. In November 1903 the national banks had a paid up capital of \$5,528,500, a million more than in 1902. In 1902 the deposits in the national banks were \$21,854,404.45; in 1903, they were \$23,349,827.21. The total resources of the national banks amounted in 1902 to \$33,751,891.50, and in 1903 to \$37,623,030.27, exclusive of United States deposits amounting to \$1,298,521.28. The one savings bank in the State is located at Wheeling, but the savings feature is popular with many banks, and savings deposits amounted in 1903 to \$4,500,000. The State legislature is forbidden to grant charters to banks, but has passed general laws under which the secretary of state grants charters to banks that have complied with the legal requirements. In order to obtain a charter a bank must have a capital of not less than \$25,000 and not more than \$500,000. Ten per cent of the capital must be paid in before the charter is granted, and 40 per cent must be paid in before the bank can open. A State commissioner of banking inspects each state bank once or more each year, but does not inspect national banks. It is his duty to see that the books and records are properly kept, and that the public is protected against loss from failure of a state bank. He has authority to call for books and papers and to require that his directions be followed. When he thinks it necessary he may, with the advice of the attorney general and the consent of the governor, petition the courts for a receiver to close up the affairs of a failing bank.

Education.—The educational system of West Virginia is rapidly becoming more efficient, and now compares favorably with those of the surrounding States. In 1902 the expenditure for public education was \$2,583,533.64, or \$2.69 per capita of the total population, an annual expenditure of \$14.18 per pupil. Out of 315,810 children of school age, 236,015 were enrolled in 6,001 schools for whites and 297 schools for negroes, under 7,028 white teachers and 278 negro teachers. By law the races must be kept separate in all schools. There are 6,021 school houses owned by the State. The average length of the school term is six months, and the average pay of teachers, \$32.04 per month, or \$189.03 per year. At Morgantown, Keyser and Montgomery are preparatory schools with an enrolment of 400, affiliated with the State University. For secondary and higher education there are six normal schools for whites enrolling about 2,000 stu-

dents at Huntington, Fairmont, Athens, West Liberty, Glenville and Sheperdstown, and three for blacks at Bluefield, Harper's Ferry, and at Institute in Kanawha County; the West Virginia University at Morgantown; Bethany College at Wheeling; West Virginia Wesleyan University at Buckhannon; Salem College; Broadbudd Institute at Clarksburg; Lewisburg Female Institute; Morris Harvey College at Barboursville; Linsley Institute; Alleghany Collegiate Institute; private academies at Romney, Princeton, Alderson, Elkins, Burnsville, and in the larger cities; Business Colleges at Wheeling, Parkersburg, Clarksburg, and Charleston. The Roman Catholic Church has schools at Wheeling, Parkersburg, Clarksburg, Grafton, Huntington, Benwood, Charleston and Fairmont. In 1900 there were 80,105 illiterates over 10 years of age, 64,281 of whom were native whites, 4,730 were foreign born, and 11,094 were colored. Of the foreign born, 3,648 could not speak English.

The West Virginia Historical and Antiquarian Society was founded in Charleston in 1891, and the Trans-Alleghany Historical Society at Morgantown in 1901. The State Educational Association was organized in 1869. Each of the above associations publishes a periodical. There is a fine State museum at Charleston, administered by the Historical and Antiquarian Society.

Libraries.—In 1902 there were 1,082 school libraries with a total of 37,495 volumes. In 1900 the Bureau of Education reports 23 larger libraries in West Virginia with a total of 100,492 volumes. There are few large libraries, most of them having less than 5,000 volumes. Those of more than that number are the Wheeling Public Library, the State Library at Charleston, West Virginia University, the West Virginia Historical and Antiquarian Society, Storer College (colored), and the West Virginia Conference Seminary. In none of the libraries are there more than 25,000 volumes.

Charitable and Reformatory Institutions.—There are two hospitals for the Insane at Weston and Spencer with 1,629 patients in 1900; an Industrial Home for Girls at Salem with 50 inmates; the Deaf, Dumb and Blind School at Romney with 209 inmates; the Reform School for Boys at Pruntyton, with 288 inmates; an Asylum for Incurables at Huntington; Miners' Hospitals at Welch, McKendree and Fairmont; and the State penitentiary at Moundsville. There were in 1902, 990 convicts in the penitentiary, of whom 450 are whites and 540 are negroes; the latter, though forming only one twentieth of the population, furnish more than half the criminals. The prison is more than self-supporting. The Episcopal Church maintains a miners' hospital at Paint Creek, in Kanawha County, and the Reynolds Memorial Hospital near Moundsville. The West Virginia Humane Society cares for aged people, children, and animals. It is controlled by a board consisting of one member from each congressional district, appointed by the governor.

Churches.—The churches in West Virginia in order of membership are: Methodist Episcopal; Baptist (North); Methodist Episcopal (South); Roman Catholic; United Brethren; Methodist Protestant; Presbyterian, in the U. S.; Disciples; Presbyterian, in the U. S. A.; Colored Baptists, Regular; Protestant Episcopal; Free-

WEST VIRGINIA

will Baptists; Lutheran, United Synod, South; Lutheran, General Synod; Baptist (South). In 1903 there were 2,024 Sunday schools in the State, with 20,545 officers and teachers and 152,955 scholars.

Population.—The population of the territory now embraced in West Virginia was 55,873 in 1790; 376,688 in 1860; 442,014 in 1870; 618,457 in 1880; 762,794 in 1890; and 958,800 in 1900. The largest city in the State is Wheeling in the Panhandle, with a population of 38,878; the other principal cities and their populations are Huntington with 11,923; Parkersburg, 11,703; Charleston, 11,099; Martinsburg, 7,564; Fairmont, 5,655; Grafton, 5,650; Moundsville, 5,362. There are 14 towns with populations ranging between 2,000 and 5,000, and 15 from 1,000 to 2,000. Of the entire population 499,242 are males and 459,558 are females; the native born number 936,349 (of whom 892,854 are white) and the foreign born 22,451; the total number of whites is 915,223, of colored, 43,567, of whom 43,499 are negroes, 56 Chinese, and 12 Indians. The foreign population is found principally in Marion, Marshall, Ohio, Tucker and Wood counties,—in the mining districts and in the cities. Among the foreigners the Germans lead with 6,537; there are 3,342 Irish, 2,921 Italians, 2,622 English and Scotch, 1,025 Magyars and Slavs, and about 600 each of Canadians, Swiss, Welsh, and Poles. The negroes are found principally in the counties of Berkeley, Cabell, Fayette, Greenbrier, Harrison, Jefferson, Kanawha, McDowell, Mineral, Ohio, and Summers. There are three distinct classes of the black population: those in the cities, the agricultural negroes, and the miners. No cities have large negro populations, Wheeling and Clarksburg having each about 1,000 and Charleston 1,700. In no county does the black population outnumber the white. The principal immigration into West Virginia, excluding foreigners, has been from New York, 2,945; North Carolina, 3,964; Ohio, 40,301; Pennsylvania, 28,927; Virginia, 61,508. Native West Virginians now living in other States are distributed as follows: in Illinois, 5,882; Indian Territory, 4,658; Iowa, 3,992; Kansas, 6,568; Kentucky, 4,383; Maryland, 9,694; Missouri, 6,153; Ohio, 30,524; Pennsylvania, 19,329; Virginia, 7,162. There are 247,970 males of voting age, of whom 14,786 are negroes. Of the white voters 23,577 or 11 per cent are illiterate; of the black voters, 5,583 or 38 per cent are illiterate. There are 186,201 families in the State, of whom 183,780 are private families; 98,469 families own their homes, and 80,759 rent homes; 94,445 families live on farms, and 70,949 own farm homes, 72,216 native whites own homes, 68,984 being farm homes; 4,269 foreign families live in their own homes, and 1,983 negro families own their homes.

Militia and National Guard.—There are 200,508 males of militia age. The organized portion of the militia is known as the West Virginia National Guard, and numbered in 1904, 1,545 men. There is a brigade of two regiments under the command of a brigadier-general who has a full brigade staff. The governor is commander-in-chief and appoints the general staff. The law provides for the organization of a battery of artillery, a signal corps, and a medical department. The organized militia is supported

by appropriations from the United States and the State governments. Arms, uniforms, and equipment, and armories are provided. The national guard is subject to ten days' camp duty per year and is paid for that time.

Government.—The governor, auditor, treasurer, secretary of state, attorney-general, and superintendent of Free Schools, constitute the executive of West Virginia. All the officials above named except the attorney-general are obliged to reside at the capital. All are elected every four years. Each of the above officials reports in writing to the governor ten days before the meeting of the legislature. The governor must have resided in the State five years and must be at least 30 years of age. In case of a vacancy in the governorship within the first three years after election a new election is held. If the remainder of the term is less than one year the president of the senate acts as governor, and after him the speaker of the house is eligible. The salaries paid will be, after 1904, as follows: governor, \$5,000; secretary of state, \$4,000, in addition to fees amounting to about \$15,000; superintendent of free schools, \$3,000; treasurer, \$2,500; auditor, \$4,500 and fees, amounting to about \$20,000; the attorney-general, \$2,500 and fees. The auditor is not only comptroller of the currency but is also register of the land office and commissioner of insurance. Other State officials are the State librarian, the adjutant-general, the commissioner of banking, the State geologist, the secretary of the board of agriculture, the commissioner of labor, the five mine inspectors, the game and fish warden, and there are the following boards and bureaus: Geological Survey, State Board of Examiners for Teachers, State Board of Agriculture, Board of Dental Examiners, State Board of Health, the State Board of Embalmers, and the Board of Public Works which is composed of the governor, auditor, treasurer, superintendent of schools, attorney-general, and the secretary of state. This board cares for the interests of the State in matters relating to internal improvements. The elections for State officials are held at the time of the presidential election and the new officials take office on 4 March of the next year. The legislature meets biennially in January of the odd numbered years and may remain in session not more than 45 days. Half of the senators are elected every two years, and all of the members of the House of Delegates. There are 15 senatorial districts, each sending two senators to Charleston. A senator must be at least 25 years of age, but only voting qualifications are required of a delegate. The pay is \$4 *per diem* and mileage. Of the 30 senators, 25 are Republicans, and of the 86 delegates, 59 are Republicans, a majority on joint ballot of 50 for the Republicans. There is no *pocket veto* and a simple majority suffices to override the governor's veto; after five days a bill may become a law without his approval. The legislature is prohibited from anything except general legislation. The State is divided into five congressional districts, which are all represented in Congress by Republicans, and both senators are Republicans. The judiciary is composed of (1) the supreme court of appeals; (2) 18 circuit courts; (3) 8 courts of limited jurisdiction; (4) the courts of county commissioners; (5) justices of the peace; (6) city courts.

WEST VIRGINIA

The supreme court is composed of 5 judges elected for 12 years, and holds session once a year at Charleston, Wheeling, and Charles Town. The judges are paid \$4,500 and mileage. There are 18 circuit judges for 18 circuit courts; they are paid \$3,300 and mileage. A circuit court is held four times a year in each county. The constitution prohibits any change in the judicial system oftener than once in eight years. The rapid development of some parts of the State rendered more courts necessary, so the legislature created nine (now eight) courts of limited jurisdiction with appeal to the circuit courts. Each county is divided into from three to ten magisterial districts, and each district elects one justice of the peace, or two if the population is greater than 1,200. These justices have the usual powers of American justices of the peace, and jurisdiction over civil suits involving \$300 or less. The county court is not a common law court, and not a court of record, but rather an administrative board for county affairs. There are no chancery courts, but the courts of record have equity jurisdiction; in equity cases the trial court may appoint four commissioners in chancery who decide such questions as the court refers to them and upon their decisions and reports the judge bases his decrees. Notaries public and commissioners are appointed by the governor without limit as to number. The unit of local government is the county under the usual elective county officers: county commissioners, sheriff, clerk, tax assessor, surveyor, etc. The township system was adopted in 1863 but did not work satisfactorily, and in 1872 was abolished and the old county system revived. Each county is divided into magisterial districts corresponding to the beat, precinct, or township of the southwestern States. No State official may accept a pass from a railroad company for himself or family.

History and Politics.—The region now embraced in West Virginia was first explored by Abraham Wood in 1671. Governor Spotswood came over the mountains in 1716, and to celebrate the crossing his party drank 11 different kinds of wine in what is now Pendleton County, and in 1725 John Van Meter explored the valley of the South Branch. In 1727 Morgan Morgan built the first cabin in what is now Berkeley County. After 1735 the South Branch Valley began to fill up with the overflow from the Shenandoah Valley and from Pennsylvania and Maryland. The settlers were of several nationalities—and the composition of the people of West Virginia has always been different from that of the country east of the mountains. Some of the land in West Virginia was embraced in the "Northern Neck" grant to Lord Fairfax, and his surveyors in 1746 planted the Fairfax stone at the head of the North Branch of the Potomac to mark the western limits of the grant. In 1768, after the expulsion of the French who claimed the territory drained by the Ohio, the Six Nations sold the land to the English, though several other Indian tribes claimed the country. But within historic times no Indians have ever occupied any part of West Virginia. The attempts of the whites to take possession of these Indian lands led to bloody conflicts that lasted until after the Revolution. The West Virginians heartily supported the Revolution and

sent troops to help New England and the Middle Colonies. The history of western Virginia before 1861 is a history of controversy with eastern Virginia. Socially, politically and economically, the two sections of the State were unlike from the first. Western Virginia was democratic; eastern Virginia was aristocratic, in institutions. The idea of separation was older than the Union, the Continental Congress had been petitioned to set up a State west of the Alleghenies; the people of the West were always ready for independence. The western counties complained that they were governed for the benefit of the eastern counties. Unlike Tennessee and Kentucky, western Virginia had to wait half a century for separate State existence. The crisis came during the secession movement in 1861. The Virginia convention passed the ordinance of secession, the delegates from the western counties opposing, and submitted it to the people. From November 1860 to May, 1861 meetings were held in the western counties which made it clear that that section would not go with the South. An irregular convention of 26 counties met in Wheeling, 13 May 1861, and came near breaking away before the vote on the ordinance of secession. The western counties voted 40,000 against and 4,000 for secession. The second Wheeling convention composed of the newly elected members of the legislature and irregularly elected delegates from the counties west of the mountains, met 11 June, declared the ordinance of secession void, vacated the offices of the State of Virginia, and formed a "reorganized" government of Virginia. The legislature, calling itself the Virginia legislature, elected senators for Virginia who were received at Washington. The convention made a provision for organizing a new State by calling a third convention at Wheeling on 26 November, in which 41 counties were represented. A constitution for the new State was formed and ratified by the people in April 1862. It was at first proposed to call the new State Kanawha, but the name West Virginia was finally adopted. The "Reorganized" government of "Virginia" gave its consent to the erection of the new State, and on 31 Dec. 1862, Congress consented to admit West Virginia to the Union as soon as it should provide for gradual abolition of slavery. On 19 June 1863, the State was admitted to the Union, and the long desired separation was effected. The movement was not caused by the war; the war simply gave an opportunity to secure long-desired independence. During the Civil War no important military operations were carried on in West Virginia. The Confederates early lost control of the State, but there were skirmishes and raids until near the end of the war. However, as compared with the other Southern States, West Virginia suffered little. From the State about 29,000 soldiers entered the Union army, and about 10,000 went into the Confederate. Laws were passed by the legislature confiscating the property of Confederates, and after the war all Confederates and Confederate sympathizers were disfranchised from voting and holding office. In 1869 it was officially reported that 29,316 persons,—nearly half of the voting population—were disfranchised. In the reaction against the Fourteenth Amendment, the Flick Amendment to the State Constitution, which combined white enfranchisement

WEST VIRGINIA CAMPAIGN OF 1861

with negro suffrage, was adopted. But before its adoption in 1871 the Democrats carried the State. Thus the liberal measures were proposed by the Republicans. The Democrats retained control of the State until 1897 when the Republicans carried the elections. The change in political complexion was due to the great industrial development of the State which attracted a heavy immigration from the States to the north and west. West Virginia was the first State to begin the undoing of reconstruction; and the first to break from the ranks of the "Solid South."

WALTER L. FLEMING,
Of West Virginia University.

West Virginia Campaign of 1861. At the outbreak of the Rebellion West Virginia had few slaves, no sympathy with the secession movement, and adhered to the Union. Her citizens denounced the action of the State convention in adopting an ordinance of secession, and at town and county meetings passed resolutions looking to a separation of the western counties from the rest and the organization of a new State. On 13 May 1861 a delegate convention was held at Wheeling, 26 counties being represented by nearly 400 leading Union men, and an interchange of views resulted in a decision to secede from the State should the ordinance of secession be ratified by the vote of the people to be given on the 23d of May, and a provisional convention was called to meet on 11 June following. The vote cast on 23 May was large and showed a majority against secession in the west. Out of a vote of about 44,000 in 50 counties 40,000 were against the ordinance of secession.

Meanwhile Gov. Letcher had called out the militia of West Virginia and ordered officers to protect the Baltimore & Ohio Railroad and guard the frontier of the State against invasion by Ohio and Pennsylvania. The principal officer assigned to this duty was Col. Geo. A. Porterfield, who, 4 May, was ordered by Gen. R. E. Lee to Grafton to call out the militia and enroll volunteers to protect the railroad and encourage secession sentiment. Five thousand men were thought ample for the purpose, but Porterfield could not raise a tenth of that number and troops had to be sent from the eastern part of the State. Gen. Lee had informed Porterfield that it was not intended to interfere with the peaceful use of the railroad, but Gov. Letcher, incensed at the overwhelming Union sentiment and the apathy of the citizens in volunteering, and moved also by the collection of Ohio troops on the border, ordered Porterfield to make a

descent on Wheeling, seize and carry away the arms sent there by the national government, and arm his men with them, and specially commanded that should troops of Ohio or Pennsylvania endeavor to pass over the railroad to destroy it and the bridges. To seize Wheeling was impossible with the few men at his disposal, but, convinced that the Ohio troops were on the eve of a movement eastward, Porterfield burned the bridges of the railroad between Farmington and Mannington. This action was immediately followed by the occupation of the railroad and contiguous country by loyal West Virginia, Ohio, and Indiana troops, under command of Gen. McClellan, who had been assigned to the command of a military department embracing Ohio, Indiana, Illinois and West Virginia. Upon the advance of these troops from Wheeling and Parkersburg on the 27th, Porterfield abandoned Grafton on the 28th and fell back to Philippi, from which place he was driven on 3 June to Beverly. (See PHILIPPI, ENGAGEMENT AT.) Gen. Garnett was sent to relieve Porterfield and took position at Rich Mountain and Laurel Hill. Col. John Pegram's detachment at Rich Mountain was attacked and defeated by McClellan, 11 July, many men were taken prisoners and the rest retreated over Cheat Mountain. McClellan pursued through Beverly and Huttonsville, seized the summit of Cheat Mountain and intrenched a part of his command on the main Staunton turnpike leading over the mountain. (See RICH MOUNTAIN, BATTLE OF.) Garnett, who was at Laurel Hill, abandoned his position on the night of the 11th and retreated northeast toward the Northwestern turnpike, was overtaken at Carrick's Ford, on Cheat River, on the 13th, was killed, and his command, making a rapid retreat reached the Northwestern turnpike and turning southward arrived at Monterey in a demoralized condition. There are but three routes across the mountains separating West Virginia from the Shenandoah Valley that are practicable for military operations: the Northwestern turnpike on the north; the Staunton and Parkersburg turnpike farther south, and the Kanawha turnpike leading past Gauley Bridge, still farther south. While McClellan was seizing the two first, a column under Gen. Cox was operating on the latter. At the time Gen. Garnett was sent to Rich Mountain, Gen. H. A. Wise was ordered to raise a force for the defense of the Kanawha Valley, and Gen. J. B. Floyd was directed to raise a brigade for service in southwestern Virginia. It had been McClellan's intention to conduct his campaign in West Virginia by way of the Kanawha Valley, but the gathering of the Confederates near Beverly determined him to proceed to that region and postpone his Kanawha campaign till northwestern Virginia should be cleared of the enemy. Later it was found that the presence of Wise in the Kanawha Valley menaced his flank and 2 July Gen. Cox, with a brigade, was ordered to cross the Ohio at Gallipolis and conduct a campaign against Wise, and on the 6th he was ordered to march on Charleston and Gauley Bridge. Cox crossed the Ohio, with about 3,000 men, drove in some of Wise's advanced detachments, and on 11 July moved up the Great Kanawha River in transports. The river was navigable for small steamers about 70 miles, to a point 10 or 12 miles above Charleston, the only important town of the region,

WEST VIRGINIA CAMPAIGN OF 1861

which is at the confluence of the Kanawha and Elk rivers. On the evening of the 16th Cox reached the mouth of the Pocotaligo, a large creek which enters the Kanawha from the north, where he heard that some of Wise's forces were in position above the mouth of Scarey Creek on the south side of the Kanawha, and about three miles distant. It was necessary to dislodge this force before he could proceed farther. Troops were landed on the south side of the river, on the 17th, and the position was attacked, but Cox's men were repulsed with a loss of 14 killed and 47 wounded. (See SCAREY CREEK, ENGAGEMENT AT.) This check delayed Cox until he could get land transportation, which came up on the 23d, and the next day he advanced, took Charleston on the 25th, which Wise had hurriedly abandoned, and on the morning of the 29th reached Gauley Bridge, Wise retreating before him and not halting till he reached Greenbrier and the White Sulphur Springs, where he was joined by Gen. Floyd. The whole of West Virginia, with the gateways to the East were now in Union possession, but the Confederates did not let the possession go unchallenged and made efforts to recover the lost ground.

After the defeat and death of Gen. Garnett, Gen. W. W. Loring was ordered to the command of the Confederate forces in northwestern Virginia, and being strongly reinforced began preparations to retake Cheat Mountain. Before these preparations were completed, Gen. R. E. Lee was assigned to the command of all the Confederate forces in West Virginia, and early in August joined Loring at Valley Mountain, where he remained a month, making himself acquainted with the country, bringing up reinforcements and supplies, and elaborating a plan of campaign by which he proposed to break through the Alleghanies and recover the country west to the Ohio. His point of attack was the Union position covering Beverly and the road westward. McClellan had been called to Washington, leaving Gen. Rosecrans in command in West Virginia, and Gen. J. J. Reynolds had command of the Union troops holding intrenched positions at Cheat Mountain summit, Elk Water and Huttonsville. Two Confederate columns were sent by the Staunton road against Cheat Summit and one by the Lewisburg and Huntersville road against Elk Water. At the same time another column was ordered to pierce the line between Elk Water and Cheat Summit, a distance of eight miles through a trackless mountain forest, to gain the rear of both positions. The movement began on 11 September, a part of Lee's command succeeded in reaching the rear of the Union troops at the Summit, a part attacked by the Staunton road in front, and both were repulsed. The column sent against Elk Water appeared before that position but, upon the failure of the other columns made no attack, and on the 15th all the columns retired to their old positions. Lee was greatly disappointed and deeply mortified at his failure, and was under a cloud from which he did not emerge till after he had succeeded to the command of the Army of Northern Virginia, in June 1862. No further effort was made by the Confederates to regain the ground lost in the northwest, nor was a general Union advance attempted, but there were sharp encounters at Camp Bartow and

Camp Alleghany (qq.v.) both resulting in Confederate success.

Floyd and Wise, who had united forces near Lewisburg, moved forward in the middle of August to Sewell Mountain, and on the 23d Floyd crossed to the north side of Gauley River at Carnifax Ferry to flank Cox at Gauley Bridge and drive him down the Kanawha Valley to the Ohio. He attacked and defeated the 7th Ohio at Cross Lanes, on the 26th, and on 10 September was attacked by Gen. Rosecrans and that night recrossed the Gauley and retreated to Sewell Mountain (see CARNIFAX FERRY). After some delay Rosecrans advanced to the top of Big Sewell Mountain, 34 miles from Gauley Bridge and began skirmishing with the Confederates. Lee, with a part of Loring's command, joined Floyd on the 29 September and assumed command. The two opposing armies that lay opposite each other upon the crests of Big Sewell, separated by a deep gorge, were about equal in number, but each commander had exaggerated ideas of the strength of the other, and it was difficult for either to make an offensive move. Each was looking for weak points in his adversary's position, using extraordinary energy to feed the men and animals, and waiting for the rains to cease and the roads to dry. But the rains did not cease, there was an extraordinary rise in the waters and on the night of 5 October Rosecrans began to fall back and at the end of four days his brigades were in camp between Hawks' Nest and Gauley Bridge. When Lee discovered that Rosecrans had gone he ordered the cavalry to follow; when satisfied that he had gone clear to Gauley Bridge he began repairing the road from Sewell Mountain to Lewisburg, and projected a campaign for Floyd down the left bank of New River and then to the mouth of Loop creek, the head of navigation of the Kanawha to intercept Rosecrans' communications, while an effort was being made to press him in front. Floyd lost no time in preparing for the movement to drive Rosecrans from Gauley Bridge back to Charleston, probably to the banks of the Ohio. On 10 October he started and after a difficult march over mountain roads, crossed New River at Richmond Ferry, and toiled on over the Raleigh, Fayette and Kanawha turnpike, through Fayetteville, and on the 22d camped on Cotton Hill, five miles beyond Fayetteville, in the elbow south of the junction of the New and Gauley rivers. On the next day he wrote the Confederate Secretary of War that with a proper force he could dislodge Rosecrans from Gauley Bridge and drive him back to Clarksburg, with 10,000 additional men he would win the whole Kanawha Valley before the conclusion of the campaign. Meanwhile Lee had informed him that Loring's troops would march back to the Cheat region, and this settled the fact that he would have to measure strength with Cox unaided by any advance on the Lewisburg road. On 1 November he opened on Rosecrans with artillery. Rosecrans planned to capture him, and on the 12th Floyd retreated, narrowly escaping capture (see GAULEY BRIDGE). The campaign on the Kanawha, as in the Cheat region, was ended. The inclement weather rendered extended movements impracticable, and both Union and Confederates found ample employment in getting up supplies, maintaining the

WEST VIRGINIA UNIVERSITY — WESTALL

roads in condition, providing shelter and guarding against surprise. Scouting was restricted to narrow limits and the results were unimportant. But the campaign had been one of the greatest importance. The whole line of the Alleghanies, from the Pennsylvania border on the north and beyond the Kanawha on the south, was securely guarded against incursions from the east, and westward to the Ohio River, western Virginia was in the hands of the Union government. The political transformation of West Virginia kept pace with the military movements and finally resulted in the formation of a new State.

E. A. CARMAN.

West Virginia University, the State university located at Morgantown, W. Va. In 1814 the Monongalia Academy was incorporated by the Virginia legislature and located at Morgantown; and for 50 years was the leading school in the western part of Virginia. In 1864 the provisions of the land grant act of 1862 were extended to the new State of West Virginia, and in 1867 the West Virginia Agricultural College was founded. The property of the Monongalia Academy was then transferred to this college, and the new institution opened in August 1867. In 1868 the name was changed to West Virginia University. It is open to women on equal terms with men. The university now comprises the following departments: (1) the College of Arts and Sciences; (2) the College of Engineering and Mechanic Arts; (3) the College of Agriculture; (4) the College of Law; (5) the College of Medicine; (6) the School of Music; (7) the Commercial School; (8) the School of Fine Arts; (9) the School of Military Science and Tactics; (10) the three preparatory schools at Morgantown, Montgomery, and Keyser. A summer school is also maintained. In the College of Arts and Sciences two courses are offered, the classical and the scientific, leading to the degrees of A.B. and B.S. Certain studies are required, but both courses are very largely elective; the subjects of study arranged in three groups, language, science, and philosophy (including history and pedagogy). Each student is required to elect a major nine courses in one group, a minor, six courses in another group, and a sub-minor three courses in the remaining group; for the degree of B.S. the major must be in science. The degrees of A.M. and Ph.D. are conferred for graduate work. The curriculum includes history and principles of education, school administration, and the art of teaching, courses in science and theory of music count toward the A.B. degree degree. The College of Engineering and Mechanic Arts offers four years' courses in civil, mechanical, and electrical engineering leading to the degree of B.S.; and graduate courses leading to the degrees of C.E. and M.E. The undergraduate courses include general culture subjects; class room work is supplemented by practical field and shop work. There are also special courses in manual training for teachers, and in the mechanic arts for practical mechanics, electricians, etc. The College of Agriculture offers a four years' course leading to the degree of B.S. in agriculture, a

two years' course leading to the degree of B.Agr., a one year's course in agriculture, and winter courses of 12 weeks in agriculture, animal industry, horticulture, and poultry raising. A dairy course was added in 1903-4. The College of Law offers a two years' course leading to the degree of LL.B. The medical department is the College of Physicians and Surgeons of Baltimore, which is affiliated with the university; the course is four years; the first two years' work may be done at Morgantown or Baltimore, the last two years' work is done at Baltimore. The Woman's Medical College of Baltimore has also been affiliated with the university on the same terms. In the School of Military Science and Tactics, 225 State cadets are appointed and receive their equipment and tuition free; students of the university may join the cadet corps for military instruction. The military course is the same as that at West Point; the State cadets also take courses in other departments of the university. The Commercial School offers a full two years' course, including electives in the College of Arts and Sciences and the preparatory school; and shorter courses in special subjects, open to students in other departments. The Summer School offers courses in the general college subjects, and in education with special attention to methods, in law, fine arts, music, and commercial subjects. A special school of methods for Sunday school workers with a session of one week is also connected with the Summer School. The university is one of the institutions affiliated with the Central Oratorical League, a students' organization for the maintenance of a high standard in public speaking. The students also maintain literary societies, a choral society, an athletic association, and a Farmers' Grange for the members of the College of Agriculture. The campus, consisting of 25 acres, occupies a picturesque site bordering on the Monongahela River; the buildings include Woodburn Hall, Martin Hall, Science Hall, Commencement Hall, Mechanical Hall, the Library (completed 1903), the Armory and Drill Hall, and the Agricultural Experiment Station. The library contained, in 1903, 21,000 volumes; in addition to which there are the libraries of the College of Law and of the experiment station, and the Willey Library. The income is derived mostly from the land grant endowment, the national appropriation for agricultural colleges, and the State appropriation. The students in all departments in 1903 numbered 1,099, of whom 935 were in the schools at Morgantown, 277 were in the College of Arts and Sciences, 59 in the College of Engineering, and 39 in the College of Agriculture.

West Wind Drift. See CURRENTS, OCEAN.

West'all, Richard, English painter: b. 1765; d. London 4 Dec. 1836. He was apprenticed in London to an engraver on silver in 1779; subsequently studied at the schools of the Royal Academy and began to practise his art in association with Thomas Laurence in Soho Square. Here he became very popular as an illustrator of books and for a single design in water colors sometimes received \$400 or \$500. He also painted historical subjects. His 'Elijah Restoring the Widow's Son to Life' was purchased for some \$2,250 by the directors of the British Institution; but his paintings in oil were not generally salable; his designs and

WESTALL — WESTERLY

figures are monotonously conventional, although some of his scenes from peasant life are by no means destitute of freshness and charm. One of his last occupations was that of teaching drawing to Princess afterward Queen Victoria of England. His water color painting, 'Cassandra Prophesying the Fall of Troy,' is now in the South Kensington Museum; and his pictures in oil of 'Christ Crowned with Thorns' in All Souls' Church, Langham Place, London.

Westall, William, English novelist: b. White Ash, Lancashire, 7 Feb. 1834; d. 9 Sept. 1903. He was educated at the Liverpool High School, engaged in business and in journalism, and was foreign correspondent for the *London Times* and *Daily News*, traveling in North and South America and in the West Indies. He has been a prolific writer and among his publications are: 'Tales and Traditions of Saxony and Lusatia' (1877); 'In Tropic Seas' (1878); 'Harry Lohengrin' (1879); and 'The Old Factory' (1881); 'Red Ryvington' (1882); 'A Queer Race'; 'A Phantom City.'

Westboro, Mass., town in Worcester County, on the Boston & Albany Railway, 12 miles east of Worcester, 32 miles west by south of Boston. It contains five churches, a public library with 12,000 volumes, the Westboro Insane Hospital, the Lyman Reform School, a savings bank, a national bank, a weekly newspaper, and numerous important manufacturing industries, the chief being those connected with straw and leather goods, boots and shoes, and automobiles. Westboro was settled about 1659, and at first known as Chauncy, but in 1717 it was incorporated under its present name. Pop. (1890) 5,195; (1900) 5,400.

Westbrook, Maine, city in Cumberland County, on the Presumpscott River, and on branches of the Boston & Maine and the Maine R.R.'s; six miles northwest of Portland. Electric lines extend to Portland. The river furnishes considerable water-power, which is utilized by manufacturing, chief of which are silk and cotton mills, paper and flour mills, and machine shops. The silk and cotton products are mainly dress goods, cotton warp, and seamless bags. In 1900 (government census) Westbrook had 42 manufacturing establishments, which were capitalized for \$3,950,221, and in which were 1,405 employees. The raw material cost annually \$1,372,166, and the finished products were valued at \$2,851,660. The bank has a capital of \$50,000, and, in 1903, had \$396,760 in deposits. The city has eight churches, the Presentation Convent, a high school, public and parish elementary schools, and the Walker Memorial Library. Pop. (1890) 6,632; (1900) 7,283.

Westbury, Richard Bethell, BARON, English jurist and statesman: b. Bradford-on-Avon, Wiltshire, 30 June 1800; d. London 20 July 1873. Graduated from Oxford in 1818, he was admitted to the bar at the Middle Temple in 1833, in 1852 became solicitor-general, and in 1856-8 was attorney-general under Lord Palmerston. This post he held a second time, in 1859-61, and in 1861 he became lord-chancellor. As chancellor he did much by his decisions to aid the development of British equity jurisprudence, especially so in joint stock-company law, ecclesiastical appeals, and patent law.

Westcott, wěst'kòt, Brooke Foss, English bishop and theologian: b. Birmingham January 1825; d. Bishop Auckland 27 July 1901. He was graduated from Trinity College, Cambridge, in 1848, was elected a fellow of his college in 1849, and in 1851 was ordained in the English Church. He was assistant master at Harrow 1852-59, and here he remained till 1869, when he became a residentiary canon of Peterborough. He became canon of Westminster in 1883, and on the death of his friend Lightfoot, bishop of Durham, was appointed his successor in 1890, and in this see he remained till his death. He showed a deep interest in the lot of the miners in his diocese, which won him their genuine esteem, and he was very successful in preventing and settling industrial disputes. From 1870 to 1890 he was regius professor of divinity at Cambridge, and during his tenure of the office exercised a powerful and abiding influence on undergraduates and scholars. As a scholar and theologian Westcott's position was a very high one. As a textual critic he is best known for his share in the revision of the Greek text of the New Testament, which occupied him and J. F. A. Hort for 28 years, and resulted in the publication of their important work, 'The New Testament in the Original Greek,' in 1881. The text formed the basis of the Revised Version of the New Testament. His other published works include among others: 'General Survey of the History of the Canon of the New Testament During the First Four Centuries' (1855), a standard work which has gone through many editions; 'Introduction to the Study of the Gospels' (1860), another work of much value which has gone through numerous editions; 'A General View of the History of the English Bible' (1868); 'The Paragraph Psalter' (1879); 'The Revelation of the Risen Lord' (1882); 'Christus Consummator: Some Aspects of the Work and Person of Christ in Relation to Modern Thought' (1886); 'Social Aspects of Christianity' (1887); 'Essays in the History of Religious Thought in the West' (1891), a work of profound and suggestive thought; 'The Gospel of Life' (1892); 'The Incarnation and Common Life' (1893); 'Lessons of the Revised Version of the New Testament' (3d ed., 1898); 'Christian Aspects of Life' (2d ed., 1897); 'Lessons from Work' (1901); and 'Words of Faith and Hope' (1902). He was one of the New Testament revision company. Consult 'Life,' by his son (1903).

Westcott, Edward Noyes, American novelist: b. Syracuse, N. Y., 27 Sept. 1847; d. there 31 March 1898. He was a banker in his native city, but compelled to retire because of failing health, spent the winter of 1895-6 in Italy and in the latter year completed the novel 'David Harum,' which he had begun soon after his retirement from business. It was declined by many leading publishers, but when issued in the autumn of 1898, six months after the author's death, became at once a success, reaching a sale of 400,000 copies in a little more than a year. The construction of the novel is weak, but it is a faithful reflection of certain phases of life in central New York, and its humor is undeniable.

Westerly, R. I., town in Washington County, on the Pawcatuck River, and on the

WESTERN AUSTRALIA — WESTERN MARYLAND COLLEGE

New York, New Haven & Hartford Railroad. It is in the southwestern part of the State, near Long Island Sound. The Indian name, which for a time was retained by the white settlers, was Miquamicut. On 14 May 1669 the town was incorporated, under its present name. In 1686 the name was changed to Haversham, and in 1689 it was re-named Westerly. The town contains five villages, each with its own post-office. Noyes' Beach and Watch Hill are favorite summer resorts. The chief manufacturing establishments are cotton and woolen mills. The granite quarries of the town are known for the quality and amount of their products. There are six banks; the three savings banks have (1903) deposits amounting to \$4,231,700. Pop. (1890) 6,813; (1900) 7,547.

Western Australia, one of the States of the new Commonwealth of Australia. See AUSTRALIA, WESTERN.

Western College, located at Toledo, Iowa. It was founded by the Iowa Conference of the United Brethren in Christ; was incorporated in 1856; and was opened to students in 1857. It was first located at Western, Linn County, but was moved to Toledo in 1881. In 1880 the main building was destroyed by fire, but was immediately rebuilt. The board of trustees consists of representatives of the alumni and of five conferences of the United Brethren, and three members-at-large. The college is open to men and women on equal terms. Two regular college courses are offered, the classical and the scientific, and the degrees of A.B. and B.S. are conferred. Both courses are almost entirely elective in the last two years, the list of electives differing in the two courses. In addition to the collegiate department, there are the Academic or Preparatory School, the Conservatory of Music, the College of Commerce, the School of Elocution and Oratory, and the Department of Art. Graduates from the collegiate courses are admitted to the senior year of Yale, Chicago, and Smith without examination. The buildings include the main building, the Bright Conservatory of Music, Mary Beatty Hall (the dormitory for young women, Drury Hall (the young men's dormitory), and the College Church. In 1902 a movement was begun for securing an endowment fund of \$150,000. The library in 1904 contained 3,500 volumes; the students numbered 250, and the faculty 14.

Western Empire, The, the western portion of the Roman Empire, consisting of Italy, Illyricum, Spain, Gaul, Britain, and Africa, as distinguished from the Eastern or Byzantine Empire, comprising the eastern half of the Balkan Peninsula, Greece, Egypt, Syria, and Asia Minor, so far as Persia. This partition of the Roman Empire occurred in 364 when Valentinian I. shared the imperial authority with his brother Valens, who ruled in Constantinople as Emperor of the East, while Valentinian ruled in Rome as Emperor of the West. The partition became final in 395 when Theodosius the Great divided the Roman world between his two sons Honorius, who became Emperor of Rome and the West, and Arcadius, who became Emperor of Constantinople and the East. The Western Empire terminated in 476. See BYZANTINE EMPIRE; ROME.

Western Federation of Miners, an organization including all workers in and around

mines, mills, and smelters, for the improvement of their industrial and social condition. The Federation opposes the truck system, child labor, contract labor, and the use of the injunction in strikes, and has made special endeavor to obtain the eight-hour day for all workers. The executive officers are a president, a treasurer, and a secretary; there is also an organizer for each district (six in 1904); and these officers constitute the executive board. The Federation holds annual conventions and also provides for referring questions of policy and government to a referendum vote of the members. The executive board must approve every strike before it receives the support of the union. The Federation is a radical and militant organization, it endorses Socialism, and political action by workmen. Its motto, which appears on the back of every union membership card, is "Labor produces all wealth; wealth belongs to the producers thereof." Its official organ is the 'Miners' Magazine.' It was organized in 1893, and took the lead in the organization of the American Labor Union with which it is now affiliated. (See LABOR UNION, THE AMERICAN.) In 1894 it conducted a strike in the Cripple Creek region; considerable violence occurred and the militia was called out, but the strike was settled largely to the Federation's advantage. In 1899 it became involved in another large strike, in the Cœur d'Alene mines; a number of riots, the most serious on 29 April, resulted in martial law being declared, the county officers being very generally in sympathy with the strikers. Large numbers of the striking miners were arrested and imprisoned in a temporary prison or stockade, called the "bull pen." Men were found to take their places to some extent, and the strike was a failure. Since that time, however, the Federation has grown in numbers and in influence; it has succeeded in unionizing the majority of the mines of the Western States, and has gained a considerable amount of political control in the mining towns. In 1904 a large strike was inaugurated in the Cripple Creek region, the immediate cause being certain mine owners' discrimination against union men. The mine owners were joined by an association of business men, known as the Citizens' Alliance, whose express purpose is the destruction of the miners' organization; some violence was committed, and the situation became so serious that the governor of Colorado declared martial law. Under this law, miners were imprisoned or deported in large numbers from the vicinity of the mines. Some of the mines returned to work, but with a reduced force, or under such difficulties that they were again forced to suspend and the Federation will not admit defeat.

Western Islands. See AZORES; HEBRIDES.

Western Maryland College, located at Westminster, Md. It was founded under the auspices of the Methodist Protestant Church, and was first opened to students in 1867. It was the first college in the South to offer equal educational privileges to both sexes; but it is not strictly co-educational, as there are separate classes for women, though they are taught by the same instructors and have practically the same courses of study as the men. The courses of study are arranged in three groups, which are practically the same in the first two years, but differ in the last two, and in accordance with

WESTERN RESERVE — WESTERN RESERVE UNIVERSITY

the predominating study are known as the classical, the scientific, and the historical. The degree of A.B. is conferred for the completion of a four years' course in any of these groups. In addition, courses are offered in music, art, and elocution, and students who complete one of these courses may substitute it for certain studies of the Junior year. There is also a preparatory school which in 1899 was established in a separate building (Levine Hall) a short distance from the campus. There are two State scholarships for each senatorial district. The campus contains 14 acres situated on elevated ground in the western part of the city. The main building consists of a central part, the original building, and five wings: (1) Owings Hall, extending back from the central part; (2) Smith Hall, extending to the east; (3) Hering Hall, extending to the west; (4) Ward Hall, a rear extension of Hering Hall; and (5) a rear extension of Smith Hall. Other buildings are the Yingling Gymnasium, Y. M. C. A. Hall, Baker Chapel, built of white stone, and Alumni Hall, containing a large assembly room, the halls of the literary societies, etc. The students in 1904 numbered 250, and the faculty 24.

Western Reserve, or Connecticut Reserve, that portion of the Northwest Territory (q.v.) reserved by Connecticut when, in 1786, that State ceded to the United States other parts of the territory claimed under the charter of 1662, which granted to Connecticut lands limited east and west by the sea. This section of land is what is now included in the northeastern part of Ohio; it was all the territory between lat. 41° and 42° 2' N., and extending 120 miles from the western boundary of Pennsylvania. In 1795-6 Connecticut sold this land, except 500,000 acres, to a number of men who established what was known as the Connecticut Land Company. At first settlers hesitated about purchasing any of the land on the "Reserve," fearing the validity of the title, but when the State of Connecticut yielded all claim to the government, there was no longer any doubt about the titles. There were a large number of colonists from Connecticut who settled on this "Reserve," counties were organized, 13 in all, which were in whole or in part from lands of the "Reserve." (See NORWALK, OHIO.) The people were characterized by their thrift, industry, and the manner in which they established schools. A large part of the money received by Connecticut, for the sale of the lands, was set aside "as a perpetual fund, the interest of which should be appropriated to the support of schools." This school fund was the means of influencing in Ohio a unique system of education, in some respects different from that of any other State. Consult Matthews, 'Ohio and Her Western Reserve' (1902).

Western Reserve University, located at Cleveland, Ohio, includes the College for Women, the Graduate School, the Medical School, the Law School, the Dental School, and the Library School. As a working, though not a corporate, part of Western Reserve University is Adelbert College of Western Reserve University. Adelbert College of Western Reserve University was founded as Western Reserve College in Hudson, 26 miles from Cleveland, in 1826. As the territory formerly belonged to Connecticut, and derived its name from being territory in the West reserved for special pur-

poses, so also the influence of Connecticut's great college dominated in its establishment and during its first decades. In affiliation with the college at Hudson for many years was the Cleveland Medical School. Theological instruction was also given for many years, ceasing in 1853. In 1882 Western Reserve College was moved to Cleveland. Amasa Stone (q.v.) gave to the college the sum of \$600,000. In recognition of the gift the college took the name of a beloved son of Mr. Stone, who died while a student at Yale, becoming Adelbert College of Western Reserve University. Subsequent gifts and bequests, together with gifts made by members of his family, have amounted to more than \$1,100,000. In 1884 a university charter was obtained. The following departments, in addition to the Medical School, were established: In 1888 the College for Women, in 1892 the Dental School, the Law School and the Graduate School, and in 1903 the Library School. The Library School was endowed by a gift of \$100,000 made by Andrew Carnegie.

The college and the university have throughout their history been distinguished by a high type of scholarship. Among the professors have been Rev. Laurens Perseus Hickok, 1836-44; Rev. Clement Long, 1844-52; Nathan Perkins Seymour, 1840-70; Elias Loomis, 1836-44; Charles Augustus Young, 1856-66; Elijah Porter Barrows, 1837-52; Samuel St. John, 1838-52; Samuel Colcord Bartlett, 1846-52. Its presidents have been Charles Backus Storrs, 1830-33; George Edmond Pierce, 1834-55; Lawrence Hitchcock, 1855-71; Carroll Cutler, 1871-86; Hiram Collins Haydn, 1887-90; Charles Franklin Thwing, 1890—. The whole number of students in the different departments from the beginning has been as follows: Adelbert College, 2,091; College for Women, 750; the Graduate School, 150; the Medical School, 4,000; the Law School, 475; and the Dental School, 350. The buildings and equipment are valued at \$1,396,400 and the entire property at \$2,834,300.

In the general educational endeavor known as Western Reserve University are two administrative features of special significance. One lies in the co-ordinate method of education. A college for men, Adelbert College, and a college for women exist as essential members of the same university. Each has its own faculty and government. The two bodies of students are distinct. Each college has its endowment and buildings. The work in the sciences, however, is done in the same laboratories, but usually at different times. Professors in the same departments of the two institutions exchange courses of instruction to a certain extent. The co-ordinate method is in part a co-operative method. In a State and a part of the country noted for co-education, the method prevailing in Western Reserve University is conspicuously successful. A further significant method of administration relates to the co-operative course of study established between the Case School of Applied Science and Adelbert College. These two institutions are planted upon the same campus and each has its own board of trustees. But the two faculties have arranged a course of instruction covering five years, three of which are spent in pursuing the liberal studies of the undergraduate college (Adelbert College) and the last two years are spent in the technical school (Case School of Applied Science). At the conclusion

WESTERN UNIVERSITY OF PENNSYLVANIA—WESTFIELD

of the five-year course a bachelor of arts and a bachelor of science degree are given. Through this method the advantages of the liberal course of study are conserved and the efficiency of the specialized course also gained.

CHARLES F. THWING, D. D.,
President of Western Reserve University.

Western University of Pennsylvania, located at Allegheny, Pa., with its professional schools at Pittsburg. It was founded in 1786 and chartered in 1787, thus being the second oldest institution of learning west of the Appalachian Mountains. In 1819 its curriculum was extended, and the name changed to Western University of Pennsylvania. At first it was located at Pittsburg, and the building was destroyed in the fire of 1845; a new building was erected, but also destroyed by fire in 1849; and the university was compelled to suspend work for five years. Since that time, it has largely increased its endowment and has been uniformly prosperous. In 1895 all courses of the university were opened to women. The university now includes the following departments: (1) the Collegiate Department; (2) the Engineering Department; (3) the Western Pennsylvania School of Mines and Mining Engineering; (4) the Allegheny Observatory; (5) the Pittsburg Law School; (6) the Western Pennsylvania Medical College; (7) the Pittsburg College of Pharmacy; (8) the Pittsburg Dental College. The Collegiate Department offers three courses, the classical, the Latin-scientific, and the scientific; the degree of B.S. is conferred on the completion of the scientific course, the degree of A.B. for the other two courses. A considerable part of the work in the last two years of the classical and Latin-scientific courses is elective; the work of the regular scientific course is required, but a special course providing more thorough and continuous work in chemistry is open to scientific students. The degrees of A.M. and M.S. are conferred for graduate work. The Engineering Department offers three courses, civil, mechanical, and electrical engineering; the School of Mines offers a course in mining engineering; the degrees of civil engineer, mechanical engineer, electrical engineer, and mining engineer are conferred. The work of the first two years of the course in mining engineering is the same as that of the course in mechanical engineering. The School of Mines was established as a department of the university in 1895, when the State legislature appropriated \$50,000 for that purpose. The Allegheny Observatory was founded in 1859 by the Allegheny Astronomical Society; and in 1867 with the other property of that society was transferred to the University; its chief function is the promotion of original research, and the providing of graduate work. The Department of Law offers a three years' course, on the completion of which the degree of LL.B. is conferred. The Medical Department confers the degree of M.D. for a four years' course; the Reineman hospital is under university control, and other hospitals offer opportunities for clinical work. The College of Pharmacy offers a two years' course leading to the degree of graduate in pharmacy, and in addition an advanced third year course, graduates of which are entitled to the degree of doctor of pharmacy; the degree of pharmaceutical chemist is conferred for the completion

of three terms' work. The course in the Dental College is four years in length, and leads to the degree of D.D.S. There are several endowed scholarships in the Collegiate and Engineering departments, 12 of which are for colored students, and three for descendants of members of the Grand Army of the Republic; there are also a number of high school scholarships for honor students in accredited high schools. The students maintain a literary society, an athletic association, an electrical club, and glee and mandolin clubs. The Collegiate Department, the Engineering Department and School of Mines are located at Allegheny; the Observatory at Riverview Park, Allegheny, in buildings erected in 1902; the other departments are in the city of Pittsburg; the medical department has a clinical building, erected 1897, known as the Emma Kaufmann Clinic. The library in 1904 contained 20,000 volumes, including the Robert Watson Library, and the departmental libraries; in addition, the Carnegie libraries of Allegheny and Pittsburg are open to students, and the Allegheny County Law Library to law students. The students in 1904 numbered 916, of whom 300 were in the medical department; the faculty numbered 120.

Westfield, Mass., town in Hampden County; on the Westfield River, and on the Boston & A. and the New York, N. H. & H. R.R.'s; nine miles west of Springfield. It comprises the villages of Westfield Centre, West Farms, Middle Farms, East Farms, and Little River. The town is in an agricultural region, but it has extensive manufacturing interests. The chief manufacturing establishments are machine-shops, paper mills, thread mills, bicycle and whip factories, and cigar factories. In 1900 (government census) the town had 186 manufacturing concerns, capitalized for \$4,345,372 and employing 2,641 persons, to whom were paid annually \$1,229,643. The total cost of raw material used annually was \$2,401,460, and the value of the yearly products was \$5,072,074. From 1900 to 1904 there has been considerable increase in the amount of productions. The valley in which Westfield is located is noted for its beauty; the town has a park, Woronoco, an excellent water-supply, which is brought from Montgomery Mountain, seven miles distant, and a good sewerage system. The water plant, completed in 1874, cost nearly \$250,000. There are seven churches, the Massachusetts State Normal School, a public high school, established in 1855, public and parish elementary schools, kindergartens, and a public library, which contains nearly 20,000 volumes. There are four banks; the two national banks have a combined capital of \$400,000; the two savings banks have (1903) deposits amounting to \$3,600,890.

Westfield is on the site of an Indian village which was called Woronoco. Pop. (1890) 9,805; (1900) 12,310; (1904, est., Gov. report) 13,063.

Westfield, N. J., village in Union County; on the Central Railroad of New Jersey; about 20 miles southwest of New York. It is mainly a residential village, in a beautiful location, on an elevation. The roads leading out into the country places are excellent. There are six churches, public and private schools, and a national bank. Pop. (1890) 9,805; (1900) 12,310.

WESTFIELD — WESTMACOTT

Westfield, N. Y., village in Chautauqua County; on the Chautauqua Creek, and on the New York, C. & St. L. and the Lake Shore & M. S. R.R.'s; about 60 miles southwest of Buffalo, and 20 miles southwest of Dunkirk. It is in an agricultural and fruit region, in which the chief products are grapes, apples, peaches, and pears. It has railroad shops, a grist-mill, and fruit-basket and crate factories. There are six churches, a union school and academy, which has two endowed scholarships, and a public library, founded by Hannah Patterson by a gift of \$100,000. There is a national bank with a capital of \$50,000. Pop. (1890) 1,983; (1900) 2,430.

Westfield College, located at Westfield, Ill. It was founded in 1861 under the auspices of the United Brethren. It confers the degree of A.B. for the completion of the four years' college course. In addition to the degree course there are normal and business courses and a preparatory department. In 1903 the grounds and buildings were valued at over \$40,000. The income is derived mainly from tuition and incidental fees. In 1903 the library contained over 3,000 volumes, the students numbered 249, and the faculty 11.

Westford, Mass., town in Middlesex County; on the Boston & Maine Railway, 6 miles southwest of Lowell. It contains several villages, and has four churches and a public library. There are manufactures of woolen goods and machinery, and agriculture and granite-quarrying are carried on. Pop. (1890) 2,250; (1900) 2,624.

Westinghouse, George, American inventor: b. Central Bridge, N. Y., 6 Oct. 1846. He entered the machine shop of his father, a manufacturer of agricultural implements, when very young and early evinced an inventive genius, designing at 15 a rotary engine. He served in the Union army in 1863-4, and in 1864-5 was assistant engineer in the United States navy, after which he studied at Union College for two years. He continued his interest in mechanics, his first invention of importance being a railway frog. In 1868 he introduced the famous Westinghouse brake (see AIR-BRAKE), which he has since developed to a remarkable degree of efficiency, and which has come into international use. He was one of the pioneers in introducing alternating-current machinery, and he succeeded in securing the use of this method at the Chicago Exposition in 1893. He has also made numerous improvements in railroad signaling, and through his devices the safety of high-speed railway traveling has been greatly increased. He has erected extensive works in this country and abroad for the manufacture of his various inventions, and is president of numerous corporations. He received the Order of Leopold from the Belgian king in 1884, and in 1889 the Royal Order of the Crown from the king of Italy. He was also decorated with the French Legion of Honor.

Westlake, William, American inventor: b. Cornwall, England, 23 July 1831; d. Brooklyn, N. Y., 28 Dec. 1900. He came to the United States in 1847, settled in Milwaukee, Wis., and there was employed in a printing office. He was subsequently an apprentice to a tinsmith, and in 1853 made for Captain John Ericsson the models for his first hot-air engine. He entered the em-

ploy of the La Crosse & Milwaukee Railroad Company in 1857, and soon after began the series of inventions which made him famous. Among them are the Westlake car heater, the globe lantern, the first practical car lamp, the oil cook stove, the stoveboard, etc.

Westland, New Zealand, a provincial district in South Island, bounded north by Nelson district, south by Otago, west by the ocean, and east by Canterbury, from which it is separated by the chain of the Southern Alps. It is about 200 miles long and about 30 miles in average breadth, its area being about 4,642 square miles. It consists principally of hills branching off from the great alpine system, intersected by narrow bush-clad valleys, and merging coastward into undulating plateaus, river valleys, and shelving coasts. The rivers are numerous but short. Practically the whole of the district is covered with forest. Large tracts can be prepared easily for pastoral purposes, but there is little ground suitable for agriculture. Gold is found in the valleys of the rivers, especially in those of the Arahura and Waiho, and gold-bearing quartz is also worked in some places. Silver, copper, iron, and tin are among the other metallic treasures of the district, which has also yielded much coal, especially from the valley of the Grey. The climate is equable and temperate. This rainfall is heavy, and snow lies on the high mountains during much of the year. The capital is Hokitika, the other chief towns being Greymouth, Brunerton, Kumara, and Ross. Railways connect Greymouth with Hokitika, Jackson, and Reefton (in Nelson district). Westland was formerly part of Canterbury district. Pop. (1901) 14,466.

Westmacott, wĕst'ma-kōt, **Richard**, English sculptor, son of Sir Richard Westmacott (q.v.): b. London 1799; d. there 19 April 1872. He studied under his father, and also in Italy 1820-6, and after returning to England rose to prominence in his art. In 1857 he succeeded his father as professor of sculpture at the Royal Academy, having become associate member of the Academy in 1838 and a full member in 1840. His style resembled that of his father in many respects. He published a 'Handbook of Sculpture' (1864) and a pamphlet 'On Coloring Statues.'

Westmacott, **SIR RICHARD**, English sculptor: b. London 1775; d. there 1 Sept. 1856. He was the son of Richard Westmacott, also a sculptor, and was early trained to a knowledge of art by his father. In 1793 he was sent to Rome to study his profession under Canova, and there gained the annual gold medal for sculpture given by the pope at the Academy of St. Luke. He also obtained a first prize for sculpture at Florence, and was elected a member of the Academy there. In 1798 he returned to England, and rose rapidly into estimation as an artist. Many of the monuments in St. Paul's Cathedral are by him, and that building forms, in some respects, a gallery of his works. The figure of a Welsh girl in a monument to the memory of Lord Penrhyn, at Penrhyn, in North Wales, is considered by many as his best creation. He designed also the statue of Nelson in Birmingham, besides figures of Addison, Pitt, and many others. He became an associate of the Royal Academy in 1805, a full member in 1811, and in 1827 succeeded Flaxman as lecturer to the Academy on sculpture. He was knighted in 1837.

WESTMINSTER — WESTMINSTER ASSEMBLY OF DIVINES

Westminster, London, England, a metropolitan borough, formerly the ancient City and Liberty of Westminster, which still retains its civic title and certain privileges. Area, 2,502 acres. It is bounded on the south and east by the river Thames; east by the city of London, from which it was separated by the former Temple Bar; north by Holborn, Marylebone, and Paddington; and west by Kensington and Chelsea. It is connected with Lambeth by Vauxhall, Lambeth, Westminster, and Waterloo bridges. The parliamentary borough of Westminster created by the act of 1885 is practically coterminous with the parish of Saint Margaret and Saint John the Evangelist, the remainder of the city constituting the parliamentary boroughs of Saint George, Hanover Square, and the Strand. The city contains some of the finest and most imposing buildings in London, and teems with historical and literary associations. All the metropolitan royal palaces are within its limits, and also Westminster Abbey, the Houses of Parliament, a fine modern Roman Catholic cathedral, the principal government buildings, the headquarters of the London county council and the metropolitan police force, the National Gallery, and the Tate Gallery, Burlington House, Somerset House, and the new Caxton Hall, and the principal theatres and opera-houses.

The history of Westminster goes back to a very early period. It became a city when, in 1540, Henry VIII. made it the see of a bishop, and even though the see was suppressed ten years later it retained the right to the style of city. The only (Anglican) bishop of Westminster was Thomas Thirlby. Since 1831 a branch of the Grosvenor family has borne the title of marquis, and since 1874 of Duke of Westminster. In 1850 a Roman Catholic archiepiscopal see of Westminster was created by Pope Pius IX., the first occupant being Cardinal Wiseman. Pop. of city and metropolitan borough (1901) 183,011. See LONDON.

Westminster, Md., city, county-seat of Carroll County; on the Western Maryland Railroad (Wabash System) about 35 miles northwest of Baltimore. Two new (1904) railroads are under consideration. The city is in an agricultural section, but it has considerable manufacturing interests. The chief industrial establishments are flour mills, carriage factories, canneries, and cigar factories. In the canning season about 500 employees are engaged in the canning factories. There are nine churches. The educational institutions are the Western Maryland College (Methodist Protestant), opened in 1868; public and parish schools. The three national and two savings banks have a combined capital of \$400,000, and deposits of over \$2,000,000. The government is vested in a mayor and the common council of Westminster. The council consists of five members, elected annually, the first Monday in May.

The place was settled in 1724 by persons from the north of Ireland and a colony of English from Prince George County, of which at that time it was a part. Some Germans were also among the first settlers. The inhabitants at present are nearly all American born, descendants of Germans, Irish, English, Dutch, and French. Pop. (1890) 2,903; (1900) 3,190.

Editorial Department, 'Democratic Advocate.'

Westminster Abbey. See LONDON, *Church Buildings.*

Westminster Assembly of Divines, a celebrated assembly held in the middle of the 17th century for the settlement of a general creed and form of worship throughout Great Britain, at a time when Presbyterianism had gained a strong position in England as well as in Scotland. On the 23d of November, 1641, the House of Commons (Long Parliament) addressed to the king a remonstrance desiring a synod of the most learned and pious men throughout the island for the settling of the government of the church; but it was not till 1643, after the civil war had begun, that an ordinance was passed (on 12 June) convoking the long-proposed assembly of divines. By this act 121 clergymen, with 10 lords and 20 commoners as lay assessors, were nominated as constituents of the assembly. Among the first were—the bishops of Exeter and Worcester, Drs. George Morley, John Hacket, William Nicholson, Edward Reynolds, and Robert Sanderson, afterward bishops respectively of Winchester, Lichfield, Gloucester, Norwich, and Lincoln; Dr. James Ussher, archbishop of Armagh; Edmund Calamy, John Lightfoot, Cornelius Burges, Thomas Twisse (prolocutor), and numerous other distinguished divines of the Calvinistic or Puritan party. The lay members comprised John Selden, the two Sir Harry Vanes (father and son), Oliver Saint John, John Pym, and other noted adherents of the popular cause. The assembly commenced its sittings on 1 July 1643, in Henry VII.'s chapel, at Westminster Abbey, but in the meantime a proclamation forbidding the assembly to meet had been issued by the king on 2 June, which had the effect of inducing the greater part of the Episcopal members to absent themselves, and Episcopacy was thus almost entirely unrepresented. The majority of those who remained were Presbyterians, but there was a powerful and energetic minority of Independents. A deputation was now sent along with commissioners from the English Parliament to the general assembly of the Scottish Church and the Scottish Convention of Estates, soliciting their co-operation in the proceedings of the Westminster Assembly, and accordingly on 15 September four Scottish clergymen, Alexander Henderson, George Gillespie, Samuel Rutherford, and Robert Baillie, with two laymen, Lord Maitland and Sir Archibald Johnston of Warriston, were admitted to seats and votes by an act of the English legislature. The assembly continued to hold its sittings till 22 Feb. 1649. Among the results of its deliberations were the directory of public worship, which was presented to Parliament on 20 April and ratified on 2 Oct. 1644; the Confession of Faith presented to Parliament in October and November, 1646, and ratified, with a few verbal alterations, in March, 1648; the Shorter Catechism, presented to the House of Commons on 5 Nov. 1647, and the Longer Catechism on 15 Sept. 1648. In the latter period of the sittings of the assembly the growing power of the Independent party in Parliament presented a serious obstacle to the carrying into effect of its recommendations, though in 1648 an order of Parliament was pronounced declaring "all parishes and places whatsoever," with the exception of chapels for the king and peers, to be under the Presbyterian form of church government. The accession of

WESTMINSTER COLLEGE—WESTON

Cromwell to power destroyed the hopes of the Presbyterians, and on the Restoration the whole proceedings of the Westminster Assembly, with the ratifications of Parliament, were annulled as invalid.

While this celebrated convocation was thus allowed, as regards England, to remain almost inoperative, its deliberations have left on Scotland and on Presbyterianism as established in the United States, an impress which will never be effaced. The present standards of the Presbyterian churches are made up of the various formularies above enumerated. They were ratified by the Scottish General Assembly as follows: The Directory of Public Worship in February, 1645; the Confession of Faith in August, 1647; and the Longer and Shorter Catechism, in July, 1648. Consult: Hetherington's 'History of the Westminster Assembly' (1843; 6th ed., 1891); the 'Minutes of the Assembly,' edited by Mitchell and Struthers (1874); Mitchell's 'The Westminster Assembly' (1883); etc. See PRESBYTERIANISM.

Westminster College, located at Fulton, Mo. It was founded in 1853 by the Missouri Synod of the Presbyterian Church. Though badly crippled during the Civil War by reduction in numbers and loss of endowment, the college continued its work throughout the war. In 1892 a bequest of nearly \$120,000 for permanent endowment was received, and in 1897 the Alumni Association began a movement for further increase of this fund. In 1901 an amendment of the charter placed the college under the joint control of the Southern and the Northern synods of Missouri. The college formerly conferred the three degrees of A.B., B.L., and B.S. for the completion of the classical, literary, and scientific courses respectively; but recently arranged its course in three groups corresponding to the former three courses, and confers the single degree of A.B. Each group includes required and elective studies. Bible study is required, and Hebrew is among the electives. There is also an academy offering a classical and a literary and scientific course and commercial courses. The campus comprises 18 acres on a wooded slope bordering on Stinson Creek. There are four buildings (1904). In 1904 the library contained 7,000 volumes; the students numbered 141 and the faculty 11.

Westminster College, located at New Wilmington, Pa. It was chartered in 1852, as Westminster Collegiate Institute under the auspices of the United Presbyterian Church. The board of trustees now consists of 40 members, the majority of whom are elected by two synods of that church. The name was changed to Westminster College in 1892. The college offers two four years' courses leading to degrees, the classical and the scientific, and confers the degrees of A.B. and B.S. The work of the scientific course is mostly required; that of the classical course largely elective in the junior and senior years. Greek is required for the A.B. degree. There are also a three years' preparatory course, a department of music, and an art department. The students maintain four literary societies. Any student taking more than one study of the classical course is required to belong to one of these societies. There is no general athletic association, but a football association, baseball association, etc. The college has a pleasant situation on

elevated ground, some parts of the campus commanding a fine view. The buildings are the main building, science hall, the ladies' hall, and the gymnasium. In 1902 a commission was organized by the synods in control for the raising of a semi-centennial endowment fund. The students in 1903 numbered 289, of whom 173 were in the collegiate courses; the faculty numbered 13.

Westminster Hall. See LONDON, *Houses of Parliament*.

Westminster, Order of the Holy Cross of. See ORDERS, RELIGIOUS.

Westminster Palace, London, England, an alternative name for the Houses of Parliament, perpetuated from the ancient palace built by Edward the Confessor as a royal residence, and which contained the various national administrative and judicial offices. With the exception of the great hall, the building was destroyed by fire in 1834. The site is occupied by the new palace of Westminster or Houses of Parliament. See LONDON, *Houses of Parliament*.

Westminster School, an ancient English public school established in Westminster Abbey by Henry VIII., and refounded in 1560 as Saint Peter's College by Queen Elizabeth. The school buildings closely adjoin the abbey, several of them having once been a part of the domestic buildings of the abbey, the great schoolroom being originally the monks' dormitory; others, such as Ashburnham House, belonging to the Post Reformation period. The institution was reorganized in 1868 as one of the seven principal public schools of England. The Westminster play, for which this school is noted, is a yearly performance by the pupils of some Latin comedy. Many eminent Englishmen have been educated at this school. Consult: Forshall, 'Westminster School, Past and Present' (1884); Barker and Stenning, 'Westminster School Register' (1893).

Westminster Standards. See PRESBYTERIANISM.

Wes'ton, Edward, American electrician: b. London, England, 9 May 1850. He came to the United States in 1870 and engaged as chemist to a nickel-plating company. He devised various improvements in the process of nickel-plating, and invented several dynamo-electric machines, establishing at Newark, N. J., in 1875, the first factory in America devoted exclusively to the manufacture of the latter class of machines. After the consolidation of his plant with another company in 1881 he continued as its electrician until 1888. He has since devoted his attention to the improvement of appliances for lighting by electricity, and has introduced improvements in both arc and incandescent lighting. He was one of the founders of the American Institute of Electrical Engineers, of which he has been president since 1888.

Weston, W. Va., town, county-seat of Lewis County; on the West Fork of the Monongahela River, and on the West Virginia & Pittsburgh Railroad; about 78 miles south by east of Wheeling and 71 miles south by east of Parkersburg. It is in an agricultural region, in which considerable attention is given to stock-raising. It has a flour mill, lumber and planing mill, and machine shops. A State Hospital for the Insane is located here. The two banks have a combined capital of \$150,000. Pop. (1900) 2,560.

WESTPHALIA—WESTPORT

Westphalia, west-fā'li-ā, or **Westfalen**, vēst'fāl'en, Germany, a name originally given (1) to a large region of Germany; (2) to a duchy; (3) to an ancient imperial circle; (4) to a kingdom; (5) to a province of Prussia. These various divisions will be described in the above order.

1. The name of Westphalia was given from the second half of the 8th century to the western part of the ancient Duchy of Saxony incorporated by Charlemagne in the kingdom of the Franks, that is, to all the country between the Weser and Rhine, while the territory between the Elbe and Weser was called Eastphalia (Ostfalen). The latter name was lost after the dissolution of the Duchy of Saxony in 1180; the former was retained, and was applied in the first place to a newly erected duchy.

2. *Duchy of Westphalia*.—This was formed out of the part of the old Duchy of Saxony, then and still called Süderland or Sauerland, on the Upper Ruhr and Lenne. When Henry the Lion, the last of the old dukes of Saxony, was put under the ban of the empire, this territory was taken possession of by Philip of Heinsberg, archbishop of Cologne, who obtained the title of duke from Frederick Barbarossa. Cologne remained in possession of it until the dissolution of the archbishopric in 1801, upon which it was given, by way of indemnity, to Hesse-Darmstadt. In 1815 it was ceded by this power to Prussia, and was united with the Prussian province of Westphalia.

3. *Circle of Westphalia*, one of the ten circles into which the Empire of Germany was divided by Maximilian I. in 1512. It comprised the region between Lower Saxony, the Netherlands, Thuringia, and Hesse, as well as considerable tracts on the left bank of the Rhine; but the proper Duchy of Westphalia, as an appendage of Cologne, was considered as belonging to the electoral circle of the Rhine. Its total area was 22,175 square miles.

4. *Kingdom of Westphalia*.—The Peace of Tilsit (July, 1807) had made Napoleon master of all the Prussian territory west of the Elbe, and he also kept possession of the territories of the electors of Hesse and Hanover, and the Duke of Brunswick. Out of the countries just mentioned he created by decree of 18 August 1807 a kingdom of Westphalia, with an area of 14,712 square miles, and a population of nearly 2,000,000. Napoleon gave the kingdom to his youngest brother Jerome, and on 15 Nov. 1807 a constitution similar to the French was granted to it. The insurrections that broke out in several parts in 1809 occasioned the adoption of various severe measures, and the introduction of an oppressive system of police. At the same time the king was required to bring his army up to a strength of 30,000 men, which produced great disorder in the finances. In 1810 a part of Hanover was added to the kingdom, the whole area of which was now 17,540 square miles. After the battle of Leipsic (1813) the kingdom was dissolved. On 26 October Jerome was obliged to quit his capital (Cassel) and make his escape from the kingdom, whereupon the territories of which it was composed returned to their former possessors.

5. *The Prussian Province of Westphalia* was formed in 1815 out of some of the provinces which Prussia formerly possessed in the circle of Westphalia. It is bounded on the north by the province of Hanover; on the east by Hanover,

Schaumburg-Lippe, Lippe-Detmold, Brunswick, Hesse-Nassau, and the principality of Waldeck; south by the province of Hesse-Nassau; and west by the province of the Rhine and the kingdom of Holland. Its area is 7,800 square miles. The capital is Munster. The province in the south and northeast is generally mountainous, being traversed by the Westerwald, Rothhaar, Teutoburgerwald, and the Wesergebirge. The northwest spreads out into extensive and often marshy plains, and belongs to the basin of the Ems; the northeast and a small part of the east to the basin of the Weser; the remainder, constituting the far larger portion of the whole, belongs to the basin of the Rhine. The soil is in general far from fertile. Live-stock are numerous, particularly horned cattle, sheep, and swine; the hams made from the latter have long been famous. The staple manufacture is linen, but that of iron is also very extensive. Besides iron and coal in abundance the minerals include copper, lead, zinc, and salt. The province is divided into the three governments of Münster, Minden, and Arnsberg. Pop. (1900) 3,187,777.

Westphalia, Peace of, the treaty concluded in 1648 at Munster and Osnabrück, Westphalia (q.v.), which ended the Thirty Years' war, and established a new political system in Europe. After preliminaries had been settled at Hamburg toward the end of 1641 the actual negotiations were begun in 1644, at Osnabrück, between the empire, Sweden, and the Protestant states, at Munster between the empire, France, and other foreign powers. Two treaties were drawn up, one at Osnabrück, signed 6 Aug. 1648, and one at Munster, signed 24 Oct. 1648. Peace was restored with the signing of the latter. By this peace the religious and political state of Germany was settled. The sovereignty of the members of the empire was acknowledged. They received the right of concluding treaties among themselves and with foreign powers, only not against the emperor and empire. Their consent was made necessary to enable the emperor to put any of the members under the ban. The concessions that had been made to the Protestants since the religious peace in 1555 were confirmed. The form of public worship and the right to secularized ecclesiastical benefices were to return to what they were at the beginning of the so-called normal year 1624. The Calvinists (Reformierten) received equal rights with the adherents of the Augsburg Confession or the Lutherans. The elector-palatine had the palatinate of the Rhine and the electorate restored to him; Alsace was ceded to France; Sweden received Western Pomerania, Bremen, Verden, Wismar, and a sum equal to \$3,750,000; Brandenburg, Mecklenburg, Hanover, and Brunswick were compensated by the secularization of numerous ecclesiastical foundations. Germany lost altogether more than 40,000 square miles of territory, and about 4,500,000 inhabitants. The independence of the United Provinces was recognized by Spain, and that of Switzerland by the empire. The solemn protest of Pope Innocent X. against these terms, particularly in respect of the secularization of bishoprics and abbeys, etc., was not regarded; but the complete execution of the treaty was obstructed by many difficulties.

Westport, Conn., town in Fairfield County; on Long Island Sound at the mouth of the Saugatuck River, and on the New York, New

WESTWOOD — WEYDEN

Haven & Hartford Railroad. It was established from portions of the towns of Weston, Fairfield, and Norwalk. Westport contains three villages. It is in an agricultural region, and has a number of industrial establishments, chief of which are cotton-twine and button factories, machine shops, and manufactories of satchels and morocco. It has a high school, elementary schools, and a public library. There are two banks. The national bank has a capital of \$100,000, and the combined deposits are (1903) \$268,090. Pop. (1890) 3,715; (1900) 4,017.

Westwood, John Obadiah, English entomologist and archaeologist; b. Sheffield, England, 22 Dec. 1805; d. Oxford, England, 2 Jan. 1893. He devoted himself to sciences, making extensive researches in the fields of entomology and archaeology; was one of the founders of the Entomological Society of London in 1833, and from 1883 its honorary life president. From 1861 until his death he was professor of invertebrate zoology at Oxford. His works on both entomology and English archaeology are numerous and important. Among the former are: 'The Entomologists' Text-Book' (1838); 'Introduction to the Modern Classification of Insects' (1839-40); 'Arcana Entomologica' (1841-5); 'The Butterflies of Great Britain' (1855); 'Catalogue of Orthopterous Insects in the British Museum, Part I., Phasmidae' (1859); 'Thesaurus Entomologicus Oxoniensis' (1874); 'Revisio Insectorum Familiae Mantidorum' (1889); etc. His archaeological works, which are enriched by his excellent reproductions of manuscripts and illuminations and also by his drawings of inscribed stones and old ivories, are well known. Among them are 'Palaeographia Sacra Pictoria' (1843-5); 'Wood Carvings' (1864); 'The Utrecht Psalter' (1874); 'The Early Inscribed and Sculptured Stones of Wales' (1876-9); 'The Book of Kells: a Lecture' (1887); etc.

Wet Bulb Thermometer. See THERMOMETER.

Wetherell, wēth'ēr-ēl. Elizabeth. See WARNER, SUSAN.

Wethersfield, wēth'ēr-z-fēld, Conn., town Hartford County; on the Connecticut River, and on the New York, New Haven & Hartford Railroad; three miles south of Hartford. In the summer it has regular steamer connections with New York and intermediate ports, and it is connected with Hartford and other near-by places by electric railways. It has manufactories of mattresses, copying presses, and agricultural implements. Important industries of the town are connected with the cultivation of seeds and the packing and shipping of the same. A historic building is the Webb house, where, in 1781, Washington and Rochambeau met. A State prison is located here. The educational institutions are a high school, public and private schools and a public library. Pop. (1890) 2,271; (1900) 2,637.

Wetmore, Claude Hazeltime, American author; b. Cuyahoga Falls, Ohio, 1862. He was educated at Western Reserve University, Cleveland, Ohio, and the Ecole Polytechnique, Lausanne, Switzerland, and subsequently spent ten years in South American travel. He has published 'Sweepers of the Sea' (1900); 'Fighting under the Southern Cross' (1901); 'In Incal' (1902); 'In a Brazilian Jungle' (1903).

Wetter, vēt'tēr, Sweden, a lake about 24 miles southeast of Lake Wener, extending between the läns of Mariestad, Örebro, Linköping, and Jönköping; greatest length, 80 miles; medium breadth, about 15 miles; area, 715 square miles. Its height above the level of the Baltic is nearly 300 feet, but its depth is in some parts above 400 feet, or 120 feet below the Baltic level. Its water is very clear. It has periodic rises and falls independent of the wetness or dryness of the season, and is subject, even in the calmest weather, to violent underground swells. When these take place in winter the sounds emitted by the ice in cracking and breaking up are often tremendous. An underground ridge is traceable throughout the whole length of the lake from north to south, and its culminating points form the few islands which appear above its surface. The largest of these is the Visingsö, in the south. The Wetter forms part of a general line of navigation, which extends across the kingdom from east to west, and far into the interior. By the Gotha Canal it communicates with Lake Wener, and by the Motala Canal with the Baltic. The scenery of the lake is in many places magnificent; the chief town on its shore is Jönköping.

Wetterhorn, vēt'tür-hörn ('peak of tempests'), Switzerland, one of the most striking peaks of the Bernese Oberland; has three summits—the west, called by the natives Hasli-Jungfrau, 12,147 feet high; the middle, known as the Mittelhorn, 12,165 feet; and the east, the Rosenhorn, 12,110 feet. These were ascended first in 1844 and frequently since, the ascent being made from Grindelwald. The contrast between the bright fresh pastures and the black precipices and dazzling snow ridges of the Wetterhorn is particularly striking, making the valley of the Reichenbach a favorite resort of artists.

Wexford, wēks'fōrd, Ireland, a seaport town, capital of the county of the same name, at the mouth of the river Slaney. The town is irregularly built, and the streets narrow, but it contains some handsome buildings. It has a county court-house, town-hall, prison, theatre, barracks, etc.; three Roman Catholic churches, besides several Protestant places of worship, nunneries, a Roman Catholic college, and various schools. Above the town there is a bridge across the river 1,500 feet in length. Wexford was a Danish settlement of great strength; it was captured by Cromwell in 1649; remains of its ancient walls exist. The harbor is spacious, but has a bar across the mouth. There is a dockyard and patent slip. The herring and salmon fisheries employ many persons; malt, agricultural implements and machinery are manufactured, and distilling and brewing are carried on. The chief trade consists in the exportation of grain, cattle, poultry, butter, etc. In 1885 Wexford ceased to be a parliamentary borough. Pop. (1901), 11,168.

Weyden, vī'dēn, Rogier van der, Flemish painter; b. Tournay about 1400; d. Brussels 16 June 1464. In 1426 he was apprenticed to learn painting, in 1432 became master in the painters' guild of Tournay, and in 1436 was chosen town artist of Brussels. His four works illustrating justice, executed for the "golden chamber" of the Hôtel de Ville, were destroyed by fire in 1695. In 1449 he journeyed to Italy, where he worked at Ferrara for Leonello d'Este, and painted also

WEYER'S CAVE—WHALE

for the Medici and the Sforzas. He was the founder of the Brabant school. Among his principal extant works are: A triptych in the Belvedere of Vienna; a triptych, 'The Last Judgment,' in the Beaune Hospital; and 'The Descent from the Cross' (Madrid gallery). Consult the study by Wauters (1856); and Crowe and Cavalcaselle, 'Early Flemish Painters' (3d ed., 1879).

Weyer's (wí'érz) **Cave**, in Augusta County, Va., 11 miles northeast of Staunton. It is a large stalactitic cavern, in a spur of the Blue Ridge; and it contains a number of chambers, the largest of which is called Washington's Hall. This chamber is 250 feet long and nearly 100 feet high. This cave ranks next in importance to Mammoth and Wyandotte caves.

Weyler y Nicolau, wälér ē nē'kō-low, **Valeriano**, MARQUIS OF TENERIFFE, Spanish general: b. Palma, island of Majorca, 17 Dec. 1838. He was educated in Granada, entered the infantry school in 1853, and became under-lieutenant in the staff school in 1857. He was appointed lieutenant of the staff in 1860, and rose through higher ranks until in 1878 he became lieutenant-general. He was military attaché of the Spanish legation at Washington during the American Civil War, and in 1868 was ordered to Cuba, where he served under Balmaceda through the ten years' war. He was appointed governor-general of the Canaries in 1879, captain-general of the Philippines in 1889, and was afterward provincial governor of Catalonia. He succeeded Martínez Campos as captain-general of Cuba in 1896, and by the perpetration of many barbarities added to an already infamous record for cruelty in the conduct of the war then being waged on the island. His inhuman methods aroused the indignation of the people of the United States, where he became known as "Butcher Weyler," and in 1897, upon the change of cabinets in Spain, he was recalled. In 1901-2 he was minister of war in Sagasta's cabinet.

Weyman, wí'man, **Stanley John**, English novelist: b. Ludlow, Shropshire, 7 Aug. 1855. He was educated at Shrewsbury School and Christ Church, Oxford, studied law, and was called to the bar in 1881. For nine years he practised on the Oxford circuit, and then began a literary career in 1890 by publishing a romance entitled 'The House of the Wolf.' It was succeeded by 'The New Rector' (1891) and 'The Story of Francis Cludde' (1891), but it was his brilliant story, 'A Gentleman of France' (1893), that first brought him into prominence, and on his historical novels his reputation rests. His later works include 'Under the Red Robe' (1894); 'My Lady Rotha' (1894); 'The Red Cockade' (1895); 'The Man in Black' (1896); 'Shrewsbury' (1897); 'The Castle Inn' (1899); 'Sophia' (1900); and 'Count Hannibal' (1901). His tales are well constructed and written in a workmanlike manner, with plenty of incident and adventure, and the interest is well sustained.

Weymouth, wá'müth, England, seaport in Dorsetshire, on a beautiful semicircular bay, seven miles south-southwest of Dorchester. The borough comprises Melcombe-Regis, from which it is separated by the small river Wey. It is well built; has two parish churches, one of them in Melcombe-Regis; several other places of worship, a general and an eye infirmary, town-hall,

reading-room, Victoria jubilee hall, libraries, etc. There is a considerable coasting trade, and an active traffic, passenger and other, with the Channel Islands and France. There are ship-building, sail-making, and rope-making establishments. Portland stone is exported from the neighboring isle of Portland (q.v.). Both Weymouth and Melcombe-Regis, particularly the latter, from the beauty of the bay and its smooth, firm sands, attract numerous visitors. There is a fine esplanade about one mile in length. Pop. (1901) 19,831.

Weymouth, Mass., town in Norfolk County; on Boston Harbor, and on the New York, New Haven & Hartford Railroad; 12 miles southeast of Boston. Electric lines connect the town with Boston and the near-by towns. Weymouth contains seven villages, each one having a post-office. It has manufactories for boots and shoes, hammocks, fireworks, and machinery. It has car-repair shops and extensive wool-scouring yards. The educational institutions are grammar and primary schools, private schools, Tufts Library, which contains about 20,000 volumes, the Fogg Library, and a high school at Weymouth Centre. The town owns and operates the water-works.

The first permanent settlement was made in 1623 by Capt. Robert Georges, but the place had been visited often before this time, notably in 1622 by Thomas Weston. The place was first called by the Indian name Wessagusset, until it was incorporated 2 Sept. 1635, when the present name was adopted. Pop. (1890) 10,866; (1900) 11,324. Consult: Adams, 'Proceedings on the 250th Anniversary of the Permanent Settlement of Weymouth.'

Weyr, vír, **Rudolf**, Austrian sculptor: b. Vienna 22 March 1847. A pupil of Bauer and Cesar at the Vienna Academy, he won the Reichel prize with his 'Samson and Delilah' (1870), and in 1878 was commissioned to execute the decorations of the Grillparzer monument. His reliefs and experiments in polychrome sculpture won for him a considerable reputation. Besides numerous decorations for the university and museum buildings at Vienna, his works include the 'Triumphal Procession of Bacchus and Ariadne' for the pediment of the Burgtheater, and the great fountain before the Imperial palace.

Whale. Any large cetacean is called a whale, while any small representative of the order is usually called a porpoise or dolphin. This division of the group is unscientific, however, and breaks down when the moderate-sized forms are in question, the layman being always in doubt whether these are to be classified as whales or as porpoises.

It happens that all cetaceans having whalebone, instead of teeth, or those constituting the suborder *Mystacoceti*, are of large or huge size. These may be all quite properly called whales, but it will be necessary for the present purpose to add to this natural group the sperm whale, a representative of the toothed whales, or suborder *Odontoceti* and the bottlenosed, or ziphioid, whales, which constitute the family *Ziphiidae*, and also belong among the toothed whales. The order then stands as follows:

Order *Cetacea*. Cetaceans.

Suborder *Mystacoceti*. All cetaceans with whalebone.

Family *Balaenidae*. (Co-extensive with the suborder.)

Suborder *Odontoceti*. All cetaceans with teeth.

WHALE

Family *Physeteridae*. Sperm whales.
Family *Ziphiidae*. Bottlenosed whales.
Family *Delphinidae*. Porpoises or dolphins.
Family *Platanistidae*. River dolphins.

Whalebone Whales.—Whalers recognize several species or groups of whales with whalebone, to which they give the names of right whales, humpbacks, finbacks and sulphurbottoms. These correspond to natural groups or genera, except that the sulphurbottom is really a kind of finback. To these are to be added the California gray whale, or grayback, a very distinct genus, combining characters of right whales and finbacks, and the pygmy right whale of New Zealand. These various genera may be distinguished by the following external characters:

Humpbacks (genus *Megaptera*).—Form bulky and uncouth. Head broad and rounded in front, and flat on top, with rows of hemispherical tubercles. Belly with many broad longitudinal ridges and furrows. Pectoral fins very long (about one third the length of the body), with serrations corresponding to the joints of the index finger. A low, thick dorsal fin. Flukes with a serrated margin. Color black and white. Whalebone short, dull blackish.

Finbacks (genus *Balaenoptera*).—Form slender and graceful. Head broad and flattish, more or less pointed in front. Belly with very numerous narrow ridges and furrows. Pectoral fins short, with plain margins. A falcate dorsal fin. Color gray and white. Whalebone short, striped gray and white, or entirely black, or black with white bristles, or entirely white.

California Gray Whale (genus *Rhacianectes*).—Form rather slender. Head comparatively narrow, moderately arched and pointed. No abdominal ridges or furrows, but two short furrows on the throat. No dorsal fin. Pectorals short. Color mottled gray. Whalebone short, white.

Right Whales (genus *Balana*).—Form heavy and compact. Snout very narrow, and strongly arched. No ridges or furrows. No dorsal fin. Pectorals short and very broad. Color entirely black, or with a little white below. Whalebone very long, narrow, black.

Pygmy Right Whale of New Zealand (genus *Neobalana*).—Similar to *Balana*, but size small. A dorsal fin present. Whalebone white.

Humpbacks.—The humpback is in many respects the most remarkable of all whales. It reaches a length of about 50 feet. The anterior part of the body is very massive, but the posterior quite slender and at the same time so irregularly shaped and so awkwardly joined to the thorax that the animal appears misshapen. This effect is heightened by the dorsal fin, which is low and thick, with a concave anterior margin, and rounded tip. Not less striking are the immense crenate-margined pectoral fins, like the wings of a bird, and about one third as long as the body. The broad abdominal ridges nearest the median line join below on the throat, forming a chin-like protuberance. Humpbacks are infested by large barnacles of the genus *Coronula*, which fasten on the head, fins, flukes and abdominal ridges. Where they settle on the black skin but are afterward rubbed off, or otherwise got rid of, they leave behind distinct white marks, in the form of disks, circles, crescents, etc., which add to the singular appearance of these whales. Fastened to the large barnacles, are often bunches of

stalked barnacles, genus *Otion*, which hang down like fringes on the fins. Some nine or ten species of humpbacks have been described, but wherever observed they present characters so nearly alike that it is extremely probable that all belong to one widely-diffused species. The species of the Atlantic coast of North America and Europe is *Megaptera nodosa*. Humpbacks occur in all seas, from the Arctic to the Antarctic. They congregate in bands, or schools, which sometimes number hundreds or even thousands of individuals. They are very irregular in their movements and indulge in all manner of uncouth actions. When they dive or sound they throw the flukes out of the water. Like other cetaceans they engage in seasonal migrations northward and southward. In the North Atlantic they withdraw from the waters of Greenland, Newfoundland, Iceland, and Norway in fall and return in spring. They feed chiefly on fish.

Sulphurbottom, or Blue Whale (*Balaenoptera musculus*).—The sulphurbottom, as already stated, is a species of finback. Wherever finbacks are observed there are found to be four distinct forms. Each of these has been described from different localities under different names, but the variations are slight in each case, and have never been fully established, so that there is a strong probability that there are but four cosmopolitan species. These are the sulphurbottom, the common finback, the pollack whale, and the little piked whale. Each form will now be considered separately, beginning with the sulphurbottom. The sulphurbottom is the largest of whales and the largest of all animals now existing, and was probably not surpassed in size by any animal living in earlier geological times. The largest individual of which there are authentic measurements was 88½ feet long. The average length for adults is about 76 feet. The sulphurbottom has a massive head and broad snout, and the body tapers gradually to the flukes. The dorsal fin is falcate and less than a foot high, and is situated at a point a little more than three fourths the distance from the tip of the snout to the notch of the flukes. The pectoral fins are falcate and about 7½ feet long, from the axilla. In color the sulphurbottom is gray, nearly uniform on the head, but mottled on the back and sides. On the belly are numerous white spots. The pectoral fins are gray above and white below, the flukes gray on both sides, and the dorsal fin also gray, sometimes with a whitish centre. The abdominal ridges number 62 to 88. The whalebone is about three feet long, broad at the base, and black in color, both plates and bristles. These huge whales feed exclusively on small crustaceans, the species in the North Atlantic being the thysanopod *Euphausia inermis*. The sulphurbottoms congregate in the bays of southern Newfoundland, Iceland, and northern Norway in early spring and remain until about July. Some individuals, however, appear to remain throughout the year, and their migrations are irregular and not well understood. They rarely strand on the east coast of the United States, nearly all the individuals reported as such belonging to the next species, the common finback.

Common Finback (*Balaenoptera physalus*).—This is the most commonly observed and best known of the finbacks. In size it ranks next to

WHALE

the sulphurbottom. The form is exceedingly attenuated. Adult individuals reach an average length of 65 feet. The head is narrow anteriorly. The dorsal fin exceeds a foot in height and is situated as in the sulphurbottom. The pectoral fins are small, somewhat triangular, and about 5 feet long, from the axilla. This whale is gray on the back and upper surfaces of the pectoral fins and flukes, and white on the belly and the under surfaces of the pectoral fins and flukes. The whalebone as a whole is gray, striped longitudinally with white, but at the anterior end of the jaw on the right side the whalebone is all white. The outside of the right lower jaw is also white. These parts are dark on the left side. This singular asymmetry of coloration is peculiar to, and characteristic of, the species. The common finback feeds on various kinds of small fish, especially the capelin, herring, young cod, etc.

In the North Atlantic it appears in spring in Massachusetts Bay, the Gulf of Maine, about Newfoundland, and in Greenland waters, as well as on the coasts of northern Europe. In the fall it withdraws from these waters and is supposed to migrate southward. The large whales which strand on the east coast of the United States are almost invariably of this species. When swimming or rising to spout, this whale, like the sulphurbottom, shows the top of the head and back and the dorsal fin, but nothing beyond. The flukes are not thrown out of the water when it dives or sounds.

Pollack Whale, or Rudolphi's Rorqual (Balanoptera borealis).—This is a smaller whale than either of the preceding, adults reaching a length of about 45 feet. The form is more compact, the dorsal fin larger and more anteriorly placed. It is black on the back and sides, with a restricted gray or whitish area on the belly. The pectoral fins and flukes are dark gray, both above and below. The whalebone plates are black, but the bristles white. This whale, like the sulphurbottom, feeds on small crustaceans. Although large numbers of individuals were taken on the northern coast of Norway in some years when the fishery was at its height, it appears to be less abundant than the larger species. It was not positively known to occur on the east coast of North America until 1903, when four specimens were taken at the Newfoundland whaling stations. It cannot yet be considered more than a straggler in American waters. A similar, or identical, species has been observed in the Pacific Ocean, but little is known regarding it.

Little Piked Whale, or Lesser Finner (Balanoptera acuto-rostrata).—This is the smallest of the finbacks, and is not sought for by whalers. The form is thickset like that of a porpoise, and the head pointed. When adult, it is about 25 feet long, and the maximum length is about 28 feet. The dorsal fin is larger than in any of the other finbacks, and is situated farther forward, or at a point only about two thirds the distance from the tip of the snout to the notch of the flukes. It is very dark gray or blackish on the back and sides, and white on the belly, a little clouded with gray. The pectoral fins are blackish above, with a broad cross-band of white near the middle; below they are white. The flukes are blackish above and whitish below. In this species the abdominal ridges are very numerous and narrow. The whalebone

is very short and entirely white. The little piked whale feeds upon fish. It is found with the other species of finbacks in the North Atlantic, migrating northward and southward in the same manner, according to the season. A few specimens have been observed on the coast of New England, New York, and New Jersey, either stranded, or entangled in the nets of the fishermen. Whales of the same size and form, and with the same peculiar markings, have been observed on the coast of New Zealand, Argentina, Washington, Alaska, and in other widely separated localities.

California Gray Whale, Grayback or Devil-fish (Rhachianectes glaucus).—This remarkable whale is found only in the North Pacific. Its characters have been already enumerated above. When full-grown it has a length of about 40 feet. It is a restless and sagacious animal, and when wounded frequently attacks the boats sent out for its capture. In earlier days it was found abundantly in the winter months in the lagoons and bays of Lower California whither it repaired to breed. It is fond of playing in the surf and approaches close inshore to indulge in this recreation without fear of stranding. The gray whale is found as far northward as Bering Sea, and occurs also on the coast of Japan, but has no counterpart in other seas.

Greenland Right Whale, Arctic Right Whale, or Bowhead (Balana mysticetus).—In reviewing the observations of earlier zoologists, Cuvier came to the conclusion that but one species of right whale existed in the North Atlantic and Arctic oceans, an erroneous opinion, which nevertheless was accepted until the Danish cetologist Eschricht proved that the right whale of the Arctic was quite distinct from the species occurring farther south. This Arctic right whale, or bowhead, as it is called by American whalers, is most remarkable in appearance. The snout is narrow and arched like a bow. From the roof of the mouth depends the extraordinary, narrow black whalebone, which may be 12 feet long or even longer. This whalebone is enclosed and protected by the immense oblong lower lip, the curved upper edge of which fits against the side of the upper jaw when the mouth is shut. The back is without a fin, while the pectorals are short and broad. There are no ridges or furrows on the belly. Adults reach a length of about 60 feet. The bowhead rarely or never leaves the Arctic ice, but like other whales it migrates northward and southward with the changes of the seasons. On the east coast of America it is never seen as far south as the southern extremity of Greenland, though there is a tradition that at the time of the discovery of the country it ranged as far south as the Strait of Belle Isle in winter. It occurs in the Arctic Ocean north of Alaska and ranges southward into Bering Sea. Individuals are believed to pass back and forth through the channels between the islands north of the continent from the eastern to the western side. The bowhead feeds chiefly on small pteropod mollusks and crustaceans which occur in vast multitudes in the Arctic Ocean. It is the most valuable of whales from a commercial point of view, on account of the thickness of the blubber and the length and fine quality of the whalebone, which at present commands exceedingly high prices. Its constant pursuit for three cen-

WHALE

turies has now very greatly diminished its abundance.

Atlantic Right Whale, or Black Whale (*Balæna glacialis*).—This whale resembles the bowhead in general appearance, but the head is smaller and less arched, and the whalebone shorter, or only about seven feet long. Near the end of the snout is a low rounded protuberance, called the "bonnet" by whalers. This bonnet is covered with barnacles, which are not found adhering to the bowhead. The black whale, as its name implies, is usually entirely black, but some individuals have been reported as whitish or grayish on the throat and breast. When full-grown it reaches a length of about 50 feet. Like the bowhead it feeds upon crustaceans and pteropod mollusks. The species has been nearly exterminated, but in former days it appeared regularly in the bay of Biscay in winter and migrated northward to Iceland and northern Norway in spring. On the North American coast it ranges, or did range, as far south as Georgia in winter and toward the close of that season, or in early spring, appeared in Delaware Bay and off the coast of Long Island and Massachusetts, and later in the Gulf of Saint Lawrence. A few individuals still appear quite regularly off Long Island.

There is every reason to believe that this whale was the object of pursuit of the earliest whale fishers among the Basques in the Bay of Biscay in the Middle Ages. It was the species on which the American Colonial shore whale-fishery was based. So persistently was it pursued, however, that for many years it was supposed to be extinct and no remains which could be identified with it were to be found in any museum. Within the last 25 years, a few individuals have appeared every spring off the east coast of the United States, and a few have been captured, or have stranded, on the coasts of southern Europe and Iceland. As the right whale does not occur within the tropics, it has been questioned whether the large species observed about New Zealand, in the North Pacific and in other waters is the same as that of the North Atlantic. Opinion is at present divided on the subject, but it is generally conceded that the real differences between the right whales of the northern and southern temperate seas, if any, have yet to be pointed out. The Atlantic right whale, like the bowhead, feeds upon pteropod mollusks and crustaceans.

Pygmy Right Whale of New Zealand (*Neobalæna marginata*).—This is a remarkable little whale, resembling the large right whales, but reaching a length of only about 20 feet. It has a small dorsal fin, but no abdominal ridges or furrows. The whalebone is long and white. In color the whale is black, with a line of white along the belly. It has many osteological peculiarities, among which one of the most striking is the flatness and breadth of the ribs, of which there are 17 pairs. The lumbar vertebrae are only two in number. Little is known of the habits of this whale.

Sperm Whale (*Physeter macrocephalus*).—This whale, as already stated, belongs to the *Odontoceti*, or toothed whales, one of the two main divisions of the order Cetacea, which includes also the porpoises, river-dolphins, and bottlenosed or beaked whales. But one species of sperm whale is known. When full-grown the male reaches a length of 60 or 65 feet, but the

female is much smaller. The head is of immense size, and is shaped like an elongated wedge with the base uppermost, and the edges and free end rounded. The blowhole is single and situated at the end of the snout on the left side. The lower jaw is very narrow and much shorter than the upper, and the two sides are joined together anteriorly for about one half the length. In it are implanted about 44 large conical teeth which fit into pits in the upper jaw when the mouth is closed. There are no teeth in the upper jaw. The back is without a fin, but is raised into a number of low irregular humps posteriorly. The pectoral fins are broad and about six feet long. In color the sperm whale is blackish above and somewhat mottled with gray below. It occurs in all seas except the Arctic and Antarctic, but is essentially an animal of the tropics. The herds or schools are diversified in character, some comprising only young bulls, other females and young led by an old bull, etc. At times old bulls are encountered wandering singly or in small groups. These old males are ill-tempered and pugnacious, and do not hesitate to attack the boats of the whalers. The sperm whale feeds upon large cuttlefish, which its great strength and powerful under-teeth are supposed to enable it to dislodge from their rocky retreats at the bottom of the sea.

Bottlenosed Whales, or Beaked Whales (family *Ziphiidae*).—This family comprises four or five genera of small whales, none of them exceeding about 30 feet in length. Several species of each genus have been described, but many of them appear to be without a certain foundation. Like the sperm whale, they belong to the sub-order *Odontoceti*, or the toothed whales. They never have, however, more than four teeth regularly implanted in the jaws, but some species have numerous minute rudimentary teeth imbedded in the lips. The head of all the forms, at least in the young, is pointed, the dorsal fin low and placed far back toward the flukes, the pectoral fins narrow, and of moderate length. In the bottlenosed whale of the North Atlantic (*Hyperoodon rostratum*) the forehead gradually increases in size with age, until it is sharply marked off from the narrow beak, like the shoulder of a bottle. This species congregates in large herds and is eagerly sought by whalers for its oil. The beaked whales of the remaining genera, *Mesoplodon*, *Berardius*, and *Ziphius*, are far less abundant. They travel in pairs. *Hyperoodon* is peculiar to the North Atlantic, *Berardius* occurs only in Bering Sea and about New Zealand, while *Mesoplodon* and *Ziphius* appear to be cosmopolitan genera. The beaked whales subsist upon cuttlefish.

Spermaceti.—Spermaceti is the solid constituent of the crude oil of the sperm whale and some other cetaceans. The head of the sperm whale, between the skull and the integuments, is a kind of large reservoir of a semi-solid "head-matter" rich in spermaceti, but the substance is also contained in the oil of other parts of the body and especially the dorsal humps. To extract the spermaceti, the oil is boiled, chilled and afterward submitted to a heavy pressure. The crude brown spermaceti is refined by heating and bleaching with alkali. Spermaceti is a whitish, translucent substance, a little lighter than water, and soluble in chloroform, ether and carbon bisulphid. It melts at

WHALE-BIRD — WHALING

about 125° F. Though an excellent substance for candles, it has been very largely supplanted for that purpose by paraffin and other low-priced materials. The production in the United States in 1901 amounted to 400,000 pounds, valued at \$100,000.

Whalebone.—Whalebone is the outgrowth of horny substance from the epidermis of the upper jaw in whales of the family *Balanida*. It takes the form of triangular plates, which differ greatly in size, proportions and color in different species. Plates to the number of 200 or 300 are attached by their bases transversely to the roof of the mouth on each side. They are longest in the middle of the series and at the ends become mere bundles of fibres. The plates are smooth and straight on the outer edge, but the inner edge is fringed with coarse bristles. The bristles of adjoining plates become matted together, forming a strainer by which the whale is enabled to retain in its mouth the fish or small crustaceans, etc., on which it feeds, while the water is squeezed out through the plates by the action of the tongue. In the right whales, the humpback and the sulphurbottom, the whalebone is black or blackish; in the common finback striped gray and white; in the pollack whale, black with white bristles; and in the little piked whale, the California gray whale and the pygmy right whale of New Zealand, yellowish-white. The most valuable whalebone commercially is that of the right whales, and especially that of the bowhead, which may have a length of from 10 to 12 or even 15 feet, and is very flexible. A single bowhead yields 2,000 pounds of whalebone, valued at from \$5 to \$7 a pound.

Whalebone from the humpback, sulphurbottom and finback is short, coarse and brittle, but also enters into commerce. Whalebone is used in the manufacture of corsets, in stiffening and adding gloss to certain kinds of cloth, for surgical instruments, whips, etc.

F. W. TRUE,
United States National Museum.

Whale-bird. See FULMAR.

Whale-head, a stork. See BALENICEPS.

Whale-louse, any of various small crustaceans parasitic on whales. (See FISH-LICE.) These crustaceans have a rudimentary abdomen, and have the limbs of the first joint of the thorax or chest inserted beneath the throat. The body is flattened and of oval shape, and the legs are all prehensile. They burrow deeply into the skin of their hosts.

Whale Oil. The use of whale oil appears to be of ancient origin. It was doubtless first obtained from whales accidentally stranded on the shores, a more frequent occurrence during the early abundance of the cetaceans than at present, when their numbers have been so greatly reduced by excessive fisheries. As the demand for the oil increased beyond the supply available from stranded whales, individuals sighted from the shore were attacked and beached. Owing to the frailty of the boats and equipment, this was a more daring attempt than might be supposed. Just prior to the Revolutionary War there were 183 American vessels in the right-whale fishery of the North Atlantic waters, and 125 were engaged in cruising for sperm whales from Newfoundland to the coast of Brazil. The Revolutionary War and the War of 1812 interfered with the fisheries;

but during the period of peace following 1815 they increased greatly in extent until 1846, when the fleet numbered 678 ships and barks, 35 brigs, and 22 schooners, a total of 735 vessels, with an aggregate tonnage of 233,189 tons, and a value of \$21,075,000, exclusive of outfits and supplies. The entire capital invested in the fishery and its associated industries at that time approximated \$40,000,000, and 40,000 persons derived from it their chief support. During the same year the whaling fleet of all Europe numbered but 230 vessels. The crude value of the American catch from 1840 to 1860 averaged about \$8,000,000 annually. The greatest value was in 1854, when 2,315,924 gallons of sperm oil worth \$1.48¾ per gallon, 10,074,866 gallons of whale oil worth 59½ cents per gallon, and 3,445,200 pounds of whalebone worth 30 1-5 cents per pound were secured, the total value being \$10,802,594. In the preceding year, 1853, the total product was 3,246,925 gallons of sperm oil 8,193,591 gallons of whale oil, and 5,652,300 pounds of whalebone, the whole valued at \$10,766,521. Sperm oil and whale oil then served nearly all the diversified uses for which oil was required, the chief exception being leather-dressing, for which neatsfoot and cod oils were largely employed. The principal uses were as illuminant, lubricator, in cordage manufacture, screw-cutting, and steel-tempering. The streets of the principal cities were lighted with the oil, and theatres and public buildings were lighted with gas made from the foets.

In 1902 the whaling fleet of the United States consisted of 8 steamers, 18 barks and brigs, and 12 schooners, aggregating 8,366 tons. Of these, 11 barks and 10 schooners were sperm-whale fishing in the Atlantic Ocean, 8 steamers in the Arctic, 6 barks in Okhotsk Sea and off the coast of Japan, 2 schooners in Hudson Bay, and 1 brig at Desolation Island. The total whale-oil product of the world at present approximates 3,000,000 gallons yearly, of which 750,000 gallons are produced by the United States fisheries, 900,000 by those of Norway, and the remainder by Scotland, Russia, Japan, Newfoundland, etc.

The following tabulated statement of the yield of oil from the several species of cetaceans has been prepared after consultation with the most experienced whalers of various ports:

	Yield of oil in barrels of 31½ gallons	
	Variations	Average
Right whale, Pacific.....	25 to 250	90

Whalebone. See WHALING

Whaling, or the pursuit of whales as an industry, originated in Europe at a remote period. There are obscure references to it

WHALLEY

among the Norwegians and English as early as the beginning of the 10th century. As early as the 11th century the Basques pursued the North Atlantic right whale, or black whale, (*Balana glacialis*), with harpoons, in open boats. It is even asserted that they crossed the Atlantic in pursuit of their quarry before the time of Columbus, but this has not been substantiated. Certain it is, however, that they visited Newfoundland immediately after the discovery of America and captured the same species of right whale in those waters. They are supposed also to have first seen the Arctic right whale, or bowhead (*Balana mysticetus*), in the Strait of Belle Isle. In 1607 Henry Hudson encountered the bowhead in the vicinity of Spitzbergen. The Spitzbergen fishery developed rapidly on account of the large amount of oil yielded by this species, and was extensively engaged in by various European nations, especially the Dutch who in 1680 employed 260 vessels and about 14,000 men in the industry. During the decade beginning 1679, the Dutch took an average of about 1,000 whales annually. As the bowheads decreased about Spitzbergen, they were sought for to the westward, and in 1719 a Dutch vessel first entered Davis Strait. This fishery was developed chiefly by the British, Danes, and Americans. In 1780 there were 255 British vessels engaged in it. The first American vessel visited Davis Strait in 1732. The number increased rapidly and at the height of the fishery, just before the Revolutionary War, Massachusetts alone sent 183 vessels to the strait.

About 1670, the American colonists succeeded in establishing a boat shore-fishery for the Atlantic right whale, which in those days was abundant on the coast, especially off Long Island and in Delaware Bay, and was well known from a much earlier date through stranded individuals. Later the colonists pursued it in sailing vessels farther from shore and in the Gulf of Saint Lawrence, but finally turned their attention to the Arctic right whale, or bowhead, in Davis Strait, as already mentioned.

About 1712 the first sperm whale was captured at sea by a Nantucket whaler. This fishery rapidly rose in importance and was pursued in all quarters of the globe, especially by the Americans. The British did not apply themselves to it until 1775, but in 1700 a British whaling vessel rounded Cape Horn and opened up the Pacific fishery, which immediately grew to enormous proportions, and was at its height in 1837. The American whaling fleet in 1839 comprised 555 vessels, of which the majority were engaged in the Pacific sperm-whale fishery. In 1847 the number rose to 504, while the foreign whaling fleet numbered 230 vessels. The size of the American fleet reached its maximum in 1846, when 720 vessels were employed.

While a large part of the American fleet was engaged in the pursuit of the sperm whale, the remaining vessels were chiefly employed in hunting right whales, especially in the North Pacific. As the sperm-whale fishery declined, this branch increased in importance. In 1835 the famous Kadiak ground was discovered. A new epoch opened in 1843 when bowhead whales were first taken off the Kamchatka coast. In 1848 the first vessel passed through Bering Strait to pursue these large whales in the Arctic Ocean. The fishery in the North Pacific and adjoining Arctic was at its height in 1852, when 278 vessels were

employed. In 1866 the first American steam whaling-vessel was brought into use, and in 1880 two steamers were added to the Pacific-Arctic fleet.

The introduction of mineral oils for illuminating and other purposes, and the decrease in the abundance of whales, gradually broke down the fishery for right and sperm whales and at the present time the number of vessels engaged in the industry is but a handful compared with the fleets of former days. A few sailing vessels still pursue the sperm whale, but in 1902 only five British vessels (steamers from Dundee, Scotland), entered Davis Strait in pursuit of the bowhead. The American whaling fleet in 1902 comprised 38 vessels, including eight steamers engaged in the Pacific-Arctic bowhead fishery. Of the remaining 30 sailing vessels, 21 engaged in sperm whaling in the Atlantic; six visited Okhotsk Sea and the coast of Japan, two entered Hudson Bay, and one remained about Desolation Island. Whale-oil has greatly declined in value, but the whalebone of the bowhead, which in earlier days was worth only a few shillings a pound, now brings from five to seven dollars a pound. As a single bowhead yields 2,000 pounds or more, the profit from even a single whale is large.

The humpback whale was always pursued to some extent by right whale whalers, but the finbacks and sulphurbottoms, besides furnishing a relatively small amount of oil, were too swift to be attacked successfully with hand-harpoons. About 1805, however, Svend Foyn, a Norwegian fisherman, invented a method of shooting them with a combined harpoon and bomb fired from a swivel gun mounted at the bow of a small steamer, and for 30 years large numbers of sulphurbottoms, finbacks, and humpbacks were killed annually at stations established on the coast of Finnmark. Later the same method was employed at Iceland, The Faroe and Shetland Islands, and also about Japan. In 1808 this mode of whaling was introduced into Newfoundland, where several hundred sulphurbottoms, common finbacks and humpbacks are now killed annually.

A considerable number of common finbacks and humpbacks have been killed in Massachusetts Bay and the Gulf of Maine during the last 25 years by means of explosive bombs attached to a special form of hand-harpoon, called a "darting gun." A boat-fishery of limited extent has been in existence for many years on the coast of California. It has for its object the capture of the California gray whale, and the humpback, which are killed by harpoons fired from a swivel gun mounted at the bow of a whale boat. Similar boat-fisheries exist on the coast of New Zealand, in the West Indies, and in other parts of the world.

United States National Museum.

Whalley, hwŏl'i, **Edward**, English regicide: b. England about 1620; d. Hadley, Mass., about 1675. He was in trade, probably that of woolen-draper, at the outbreak of the Civil War, when he enlisted for Parliament. In 1643 he became major in Cromwell's regiment of horse, and in 1644 after having fought at Gainsborough and Marston Moor, appears as a lieutenant-colonel. He was made colonel of one of the two parts into which Cromwell's regiment was di-

WHARTON — WHARVES AND WHARF CONSTRUCTION

vided, and with this force took Banbury and Worcester. Later, he was superseded. After Charles I. was seized, Whalley was ordered to take charge of the king, and in that post displayed much tact. He sat for Nottinghamshire in the two parliaments assembled by Cromwell, and in 1657 was made a member of the new House of Lords. He went to Scotland as agent of the army to mediate with General Monk, but had no success. On the Restoration he did not obey the summons of surrender of the king's judges, and was therefore excluded from the indemnity. He sailed with William Goffe (q.v.) for New England, arrived at Boston 27 July 1660, resided for a time in Cambridge, but when the act of indemnity reached Boston in November and the town council met (February 1661) to consult regarding the refugees, went with Goffe to New Haven, where they arrived 7 March. He was associated with Goffe in the subsequent wanderings and concealments which have lent such interest to their history. Consult: Stiles, 'History of Three of the Judges of Charles I.' (1794); Noble, 'Lives of the Regicides' (1798); Hutchinson, 'History of Massachusetts' (3d ed. 1795); and the 'Collections' of the Massachusetts Historical Society, 3d ser. l. 60, 4th ser. VIII. 122. Mrs. H. M. Lothrop's romance 'The Judges' Cave' (1901) is founded on incidents in the New England career of Goffe and Whalley.

Wharton, hwâr'tôn, Anne Hollingsworth, American author: b. Southampton Furnace, Pa., 15 Dec. 1845. She has written mainly though not entirely upon colonial themes and among her books are: 'The Wharton Family' (1880); 'Through Colonial Doorways' (1893); 'Colonial Days and Dames' (1894); 'A Last Century Maid' (1895); 'Martha Washington: A Biography' (1897); 'Heirlooms in Miniature' (1897); 'Salons Colonial and Republican' (1900); and 'Social Life in the Early Republic' (1902).

Wharton, Edith Jones, American novelist: b. New York 1862. She was privately educated and was married to Edward Wharton in 1885. She has since resided much abroad, and has published 'The Greater Inclination' (1899); 'The Touchstone' (1900); 'Crucial Instances' (1901); 'The Valley of Decision' (1902); and 'Sanctuary' (1903), which have been greatly commended for subtle analysis and finished style; besides 'The Decoration of Houses' (with O. Codman 1897), a rendering of Sudermann's 'Es Lebe das Leben' as 'The Joy of Living' (1902), and some uncollected stories, articles, and verse.

Wharton, Francis, American jurist: b. Philadelphia, Pa., 7 March 1820; d. Washington, D. C., 21 Feb. 1889. He was graduated at Yale in 1839, studied law, and was admitted to the bar in 1843. He was professor of logic and rhetoric in Kenyon College, Ohio, 1856-63; in 1863 took orders in the Episcopal Church and became rector of Saint Paul's, Brookline, Mass. In 1866 he became a professor in the Episcopal Divinity School at Cambridge, Mass., and also held the chair of international law in the Boston Law School. In 1885 he was appointed counsel for the State Department at Washington, and under a resolution of Congress (1888) was made editor of the Revolutionary diplomatic correspondence of the United States. His best known work is a 'Treatise on the Criminal Law of the

United States' (1846), which is accepted as a standard and has passed through many editions. Other works of his are: 'Precedents of Indictments and Pleas' (1849); a 'Treatise on Medical Jurisprudence'; 'The Conflict of Laws' (1872); 'The Law of Agency and Agents' (1876); 'Commentary on the Law of Contracts' (1882); 'Treatise on the Law of Evidence and Criminal Issues.'

Wharton, Philip, Duke of, English politician: b. December 1608; d. Tarragona, Spain, 31 May 1731. At 16 he married clandestinely and in 1716 traveled on the continent, and visited the Pretender at Avignon. That prince, gratified by his attentions, gave him the title of Duke of Northumberland. About the end of 1716 he returned to England, and thence to Ireland, where he possessed a peerage, and was allowed, although not yet 19, to take his seat in the Irish House of Peers. He obtained a British dukedom in 1718 and on attaining his majority made his appearance in the English Parliament, where he distinguished himself as the defender of Bishop Atterbury, impeached as an adherent to the House of Stuart. He also published a virulent opposition paper called 'The True Briton.' He later entered the Spanish service and in 1727 served against the British at the siege of Gibraltar, for which he was in the following year attainted. His Life and Writings appeared in 1732. Consult Robinson, 'Philip, Duke of Wharton' (1896).

Wharton, Thomas, American journalist: b. Philadelphia, Pa., 1 Aug. 1859; d. there 6 April 1896. He was graduated from the University of Pennsylvania in 1879, joined the editorial staff of the Philadelphia *Times* in 1888 and at the time of his death was Sunday editor of that journal. He published 'A Latter-Day Saint' (1884); 'Hannibal of New York' (1886). His short story 'Bobbo' enjoyed wide popularity and was republished, prefixed by a biographical sketch of the author by Owen Wister as 'Bobbo' and Other Fancies' (1897). 'Bobbo' was dramatized and successfully played in England.

Wharves and Wharf Construction, the modern methods of wharf construction vary but little (except as to minor details) from the methods of the ancients. The process of constructing timber piers or wharves as practised in all of the ports of the Atlantic and Pacific seaboard is as follows: Piles of the best obtainable timber (generally pine or oak) are first driven to a solid foundation into the material forming the bottom of the harbor; these are designated as standard piles and are spaced from 6 to 10 feet from centres longitudinally and transversely (see Fig. 1), according to the desired carrying capacity of the wharf. These piles are then sawed off at the proper height above the tide level and on their tops (and fastened thereto with wrought iron drift bolts) are placed timbers of yellow pine (generally 12 inches square. These timbers are known as the caps of the wharf. On these caps are placed what are generally designated as stringers or floor beams. They are generally four inches thick and vary from 12 to 16 inches in depth, according to the load to be sustained. They are fastened to the caps of the wharf with spike-pointed wrought iron drift bolts. The stringer system is placed about 2 feet on centres on this

WHARVES AND WHARF CONSTRUCTION

superstructure; the covering planks from 3 to 6 inches in thickness being fastened with the ordinary commercial spike of requisite length. After this portion of the wharf is finished nothing remains but to protect the same, either with a system of piles driven along the side used for mooring vessels (usually called fender piles and which are fastened to the superstructure of the wharf) and are sometimes additionally protected by wearing strips of timber and plank. (See Fig. 1.) A wharf projecting out from the water front line of the harbor is generally reinforced or braced by means of brace or batter piles driven on both sides of the wharf (see Fig. 1) at an angle of about 35° with the perpendicular and they are fastened to the outside stringer as shown. The above describes more particularly, the wharves as constructed on the Pacific coast and in use in San Francisco since 1880. These wharves are 100 feet in width and about 600 feet in length.

New York Wharves.—In New York city, in wharves of the same area, contractors use about double the number of standard or bearing piles (with the exception of the four outer bents) as were used in those of San Francisco. The piles are driven 10 feet from centre to centre

tened to the before mentioned sub-caps and the other to the backing block; between these vertical fenders there are placed intermediate fenders of the same material but reaching merely between the two longitudinal fenders. In place of mooring piles there is used a cast iron mooring bit. The four outer bents of the wharves are spaced about 20 feet from centre to centre. They consist of a double row of piles, each row containing the same number of piles as are under the regular caps, or making this row of double the carrying capacity of those caps. The end piles in each of these bents and the sheathing are so arranged that they present a rounded edge to the current. This is covered for a distance of 4 feet with an armature of boiler steel one half inch in thickness and 6 feet in height, securely fastened to piles and sheathing. The wider spacing of the outer bent, the additional bracing and armature plates are for protection against floating ice. The timber for superstructure used there is what is known as hard yellow pine. The standard piles are generally of spruce and vary from 50 to 60 feet in length. The wharf timbers rarely exceed 30 feet in length.

Boston Wharves.—The ordinary wooden

FIG. 1.— Cross Section through Ordinary Wharf.

longitudinally and about 5 feet transversely; the outer pile in each bent is cut off one foot below the grade of the balance and is capped with a longitudinal sub-cap 12 inches square. The balance of the standard piles in each bent are cut off to conform with a crown of four inches in a 60-foot wharf and are capped transversely with 12×12 -inch timbers. The piles after being stayed into position, are mortised into caps having tenons $7\frac{1}{2}$ inches wide longitudinally with the caps, $3\frac{1}{2}$ inches thick and 3 inches long; the caps are also drift bolted to each standard pile with a wrought iron bolt 1 inch square. (In San Francisco, the caps are merely drift bolted to each pile with a 1-inch round iron drift bolt; no tenons are used.) The stringer system, or as they call it there, rangers, are 12×12 -inch timbers, spaced 5 feet apart, or so as to come directly over each standard pile, the outside stringers being composed of two pieces. The covering of the wharf is of two thicknesses of 4 inches each. In place of fender piles, the outside standard piles are utilized for fastening vertical fenders of 8×12 -inch white oak timbers, extending from the sub-caps to the line of low water; there are also two lines of horizontal fenders of 8×12 -inch white oak extending the entire length of the wharf (with the exception of the four outer bents); one of these is fas-

wharves of Boston are constructed as follows: Standard piles, generally of oak, are driven 9 feet transversely and 10 feet longitudinally. They are bound together transversely on top with two girder caps of 6×10 -inch hard pine and fastened to piles with 1-inch screw bolts; the girder caps are let into the piles so that the same are spaced 3 inches apart. The outside stringers are of 10×12 -inch and all inside stringers of 6×12 -inch hard pine, spaced 2 feet from centre to centre. The wharves are covered with 3-inch hard pine planks. The wharves are braced by brace piles called there spur-shores; they are of oak and are shouldered against the outer standard pile at about one foot below mean high water and fastened thereto with $1\frac{1}{4}$ inch screw bolts. In addition to bracing with piles, each bent has a set of cross-braces of 4×8 -inch oak, running from a point about 2 feet above mean low water to the underside of the girder caps. These braces are fastened to each standard pile at each intersection with 1-inch screw bolts; a horizontal tie of 4×8 -inch oak is also placed 1 foot above mean low water and fastened to each pile with 1-inch screw bolts. Fender piles of oak are driven in transverse lines with standard piles close up against the outer ones, and fastened thereto just below the girder cap with $1\frac{1}{4}$ inch screw bolts. The fender piles are cut off 9 inches

WHARVES AND WHARF CONSTRUCTION

below the top of the planking and are capped with 12 x 12-inch hard pine caps running longitudinally. These caps answer as longitudinal fenders and projecting 3 inches above the planking also as a curb or backing block. Mooring piles of oak are driven just inside of outer stringers and are held in place by 4-inch planks fitted down into adjoining stringers and around mooring piles. The corners of these wharves are similarly piled and finished as are the wharves of Philadelphia and New York. A safe load for these wharves would be about 300 pounds to the square foot.

Philadelphia Wharves.—These wharves, with the exception of two outer bents, are constructed as follows: Standard piles are, as prescribed by the rules of the Board of Port Wardens, driven in bents located longitudinally, 10 feet from centre to centre. The piles in these bents are 5 feet apart from centres transversely and before being cut off at the proper level, they are straightened and stay lathed into position. They are then bound together transversely with girder plank of 6 x 12-inch, gained into piles, equally on each side, leaving a tenon of 4 inches thick, 12 inches long and the width

stringer of 12 x 14 inches and intermediates of 6 x 14 inches laid 2 feet 6 inches from centres. They are dapped or gained out at caps 1 inch. The floor is composed of two layers of 3-inch plank, dressed to a uniform thickness; the first is laid at right angles to the axis of the wharf, and the planks are placed 6 inches apart, these spaces over the stringers being filled solid for the full width of the same. The planks in the outer section of this layer, about 12 feet in length, are creosoted with 14 pounds of dead oil to the cubic foot; they are fastened to the stringers with wrought spikes one half inch square and 7 inches long. The sheathing plank or upper layer are laid close and at an angle of 45 degrees with the axis of the wharf and are spiked to the lower plank with 5-inch wire nails averaging 3 feet apart. The backing log or curb is a 10 x 12-inch white oak timber, raised above the planking of the wharf and supported on blocking of 2 x 12 inches, laid 5 feet apart. Fender and brace piles are used only on the outer bents. The usual system of fenders is a series of 6 x 8-inch white oak timbers placed horizontally around the wharf between the top and the line of mean low water.

FIG. 2.—Cross Section through Wooden Cylinder Pier.

being the full diameter of the pile. They are fastened to each pile with two screw bolts. The cap proper is a single piece of 8 x 16 inches laid on its flat, covering the pile and being flush on each edge with the girders; they are drift-bolted to the piles and well spiked to the girder planks or clamps as they are called. The wharf is braced in the following manner: At the line of mean low water two girders of 5 x 10 inches are fastened to each pile in each bent, one on either side of the pile; the spaces between these planks and the four outer piles on each side are chocked with 12 x 12-inch timbers securely bolted to the girder plank. The bents are then diagonally braced with "A" braces of 5 x 10 on each side, making four in number, dividing the said bent into two panels, that is, a set of braces extend from the girder either way from the centre of the wharf to a point at the underside of the deck line, distant from the outside of wharf one fourth of its entire width. From the outside of wharf, at this same lower girder, another set extends to the bottom deck, and, meeting the first set, they are bolted to each pile at each intersection with galvanized screw bolts. The stringer system is composed of an outside

They are placed about 6 inches apart and are fastened to vertical furring pieces of 8 x 12-inch yellow pine which are bolted to the front row of standard piles in each bent, these piles being surfaced off to receive them. The two outer bents are constructed as to spacing, protection, number of piles and braces as are the New York wharves. They have rounded corners, white oak fender piles, and in addition, fender piles at the ends of these two outer bents; they have also brace piles and corner bands and chocks connecting fender piles.

Comparisons.—Comparing the construction of eastern wharves with those of San Francisco, leaving aside those parts in the eastern wharves which are designed to resist the floating ice, the details of the construction of the San Francisco wharves are simpler; having no gains or tenons, they are not so apt to suffer from dry rot; and the fact of having but few joints in caps and stringers, they are, consequently, in this respect superior to the eastern structures. The construction of the San Francisco wharves is, however, greatly owing to the better materials at their disposal, and for which the coast is famous. The length of timbers for wharf con-

WHARVES AND WHARF CONSTRUCTION

struction in the East very rarely exceeds 40 feet, but generally timbers up to 30 feet in length only, are specified and used. In San Francisco wharves, timbers of from 60 to 100 feet and over in length are frequently employed and are to be had with only a very small additional cost. With piles it is the same, in Eastern wharf construction; a pile 60 feet long is considered a very long pile, whereas on the Pacific coast, piles from 100 to 130 feet in length can be had at any time. The life of the superstructure of the above described wharves, especially if covered with sheds and buildings, is from 15 to 25 years, aside from the actual wear of the planking, but in sea water the life of an unprotected pile is from six months to three years owing to the ravages of the marine pests.

Marine Pests.—The most destructive of these are the *Teredo Navalis* or ship worm and

although they are sometimes less than 1-32 of an inch apart, or from the surface. The teredo enters the timber at the ground level and works upward, generally about 2 feet above low water although it will attack floating timber and I have found the wooden floats or buckets of a ferry steamer making half hour trips for 18 hours at a stretch and almost constantly in motion, completely destroyed by the teredo. It was a theory at one time that the bark on a pile was a protection against the Teredo. While this is true to a certain extent, I have seen piles taken from some of the old wharves in San Francisco Bay that were badly eaten by these worms, the bark being otherwise intact. The *limnoria terebrans* resembles a wood louse in appearance. It is about the form and size of a grain of wheat; it works between high and low water and is very destructive. It completely destroys the pile between the tide lines avoiding all metal fastenings and knots in the wood. The borings are so close together that the wood is completely disintegrated; ends and joints of timbers seem to be the most favorable points of attack. The protection of piles and timbers from these marine pests has been the study of engineers and scientists for many years and millions have been expended on experiments with varying success. In the direct preservation of piles proper, two methods have been followed. The first and longest in use is impregnating it with chemicals that are destructive to animal life and the second is by covering the pile with an insoluble armor or artificial bark impervious to the worms.

Creosoting.—Without doubt the creosoting process is the most valuable and efficient of all processes known for prolonging the life of timber. The process was invented in England about the same time that kyanizing and the other metallic salt antiseptics came into use; it has survived all other processes and is used to a greater extent than any other method both in Europe and this country. The creosote is derived from the destructive distillation of wood and coal and consists of oil products designated as dead oil when derived from the distillation of coal or coal tar and wood creosote oil when derived from the distillation of wood or wood tar. The dead oil contains naphthaline, phenic or carbolic acid and other powerful antiseptics which change the chemical nature of the sap by forming therewith soluble compounds while the naphthaline rendered sufficiently fluid by preliminary heating, enters the wood cells, solidifies and becomes permanently fixed, mechanically coating and protecting the fibres against formation of fungi. The wood creosote contains paraffine, pyroligneous acid and other antiseptics. Advantages claimed for this oil are that its penetrating power is much greater and less expensive than dead oil and that it is equally insoluble in water. The limited use of this oil seems to confirm these claimed advantages but cannot be considered conclusive until more definitely established by further experience and the test of time. All experts on preservation of timber agree on one point and that is that the density of timber must be favorable to impregnation; in other words, only open pored timbers should be used for treatment with creosote, this having the least liquidity and therefore the hardest of all preservative chemicals to force into and

FIG. 3.—Detail of Wooden Cylinder.

the *Limnoria Terebrans*. The *teredo navalis* is worm-shaped being from 6 inches to 14 inches in length and one fourth of an inch in diameter. It is of gelatinous nature and translucent. Its head is provided with calcareous substance or shell in two parts working on a hinge which performs the office of an auger. The head, like the body, completely fills the cavity bored and the outward appearance of the pile attacked shows no indication of the destruction going on within. Having once entered the timber it never works out nor will one cross another hole

WHARF CONSTRUCTION.

Views of new Howard Street Wharf, San Francisco, Cal., showing the wooden cylinder pier system of construction.

WHARVES AND WHARF CONSTRUCTION

thoroughly impregnate the wood. The Oregon pine or yellow fir used on the Pacific coast is considered too dense to permit a thorough impregnation and if treated with creosote requires a longer steaming and a greater heat to extract the sap and open the pores and also a greater pressure to force the material into the wood. The consequences therefrom have been checking and cracking the timber making it brittle and when used for piles has checked them so extensively that the limnoria has found in and behind these cracks sheltered places in which it has done its destructive work under cover and more rapidly than when exposed to swell and current. It has also made examination of those piles more difficult as the outer shell of the pile was apparently unattacked while the inner portion of the same was entered and destroyed by the limnoria. All authorities in writing on the preservation of piles for marine work seem to ignore the existence of the limnoria terebrans. In my opinion it is much more destructive on the Pacific coast than is the teredo and while a pile that has been thoroughly creosoted will resist the teredo, even if somewhat checked, the limnoria will find the slightest opening and destroy the pile. There have

substantial. Another protection against these marine pests is what is known as the built pile; it consists of a pile built up from a core of 6x6 with 1-inch boards until the same forms a pile 12 inches square, each layer being tarred and sanded. It is built on the theory that the teredo is loath to cross a scam and the test pile taken from Section I. of the seawall, a particular feeding ground of the teredo, after 10 years' immersion, verified this theory. But this was a case of again ignoring the ever active limnoria and piles built since have shown that the limnoria found a home in the seams of the boards of which the pile was constructed. However, an improvement was made in the details of construction, at my suggestion, which has resulted in keeping the limnoria out, and that was the placing of ship felt between the last two layers of boards from high water to 2 feet below low water (limnoria working only between high and low water). The result has been quite satisfactory, although I think that a time test of a large quantity of piles is the only satisfactory one. In many of the government piers where the teredo and limnoria are particularly active, numerous iron piles have been used, both wrought and cast. These are

FIG. 4.—Side Elevation.

been several methods for the preservation of piles in San Francisco harbor by means of an exterior covering or artificial bark, some of which have been more or less successful, the success depending upon the durability of the covering, or, in other words, the life of the pile is the life of the artificial bark. The one making the best showing, from the fact that it has been the longest in use, is what is known as the Paraffine Paint Company's method. It consists of a covering of P. & B. pile covering, covered with battens which have been treated with P. & B. paint. I think the secret of the success of this process is the fact that it is applied cold. Previous coverings of this character having been applied hot to a wet pile, no adhesion was obtained between covering and the pile for the reason that the hot material draws the moisture to the surface. This difficulty claims to have been avoided by the parties using what is known as the Perfection Process, by kiln-drying the piles before covering. Said process consists in covering the piles spirally with a double thickness of burlap treated with asphalt, the application or winding of the burlap being done by means of a large lathe in which the piles are turned. This covering has not had sufficient time test to pass on its merit, although it looks

prohibitory in many places for the reason of the excessive cost of the material and construction, most of the piles having either to be screwed into the bottom or driven with a water jet. Another objection is the rapid destruction by oxidization of the joints in the bracing system.

Cylinder Construction.—A mode of construction which has been very successful on the Pacific coast was invented by the writer and has been in use in the San Francisco harbor for the past ten years and has not as yet shown any latent defects. It is what is known as the wooden cylinder pier construction. (See Fig. 2.) The foundation proper consists of cylinders of concrete and piles placed about 15 feet on centres. The details of construction are as follows: The core consists of one or more piles, generally three; these are driven to a firm foundation and are left at different heights from the finished top of the proposed wharf, for example, say one pile is 50 feet in length, one 55 feet and one 60; this is for two reasons: first, for economy, as in the San Francisco Bay most of the piles depend absolutely on the friction of the mud for sustaining purposes (there being no known bottom) and it will readily be seen that the 50-foot piles will be as deep in the mud as the 60; secondly, it admits of a larger body of

WHAT CHEER—WHATELY

concrete at the top of the cylinder where required. After this cluster of piles is driven, there is then driven over and encircling same a wooden stave cylinder, generally four feet inside diameter; these staves are from 3 to 4 inches thick and bound together with wrought iron hoops having adjustable lugs; these hoops are placed about 2 feet on centres and the cylinder is made perfectly water tight. It is driven with an ordinary pile driving machine to from 10 to 15 feet into the mud. The water and mud in the interior is then pumped out to a depth of from 2 feet to 5 feet below the mud on the outside; then inside of this cylinder of wood, between it and the piles, is placed an interior cylinder of expanded metal or similar metallic interstitial web about 1 foot less in diameter than the interior of the wooden cylinder. The interior is then filled with a rich concrete of hydraulic cement and broken rock. The cylinder pier is complete and forms a teredo proof concrete pier, having a wooden core reinforced with an interstitial web of expanded metal and protected for at least four years with an iron bound wooden jacket. (See Fig. 3.) These cylinders are then capped with caps of structural steel, generally two 15-inch I beams and the balance of the superstructure is as in the ordinary wharf. The fender system is somewhat different from that in general use and is as follows: The fender piles are driven in pairs about 10 feet apart and about 1 foot away from the wharf proper; they are connected together longitudinally with a ribbing composed of three timbers both at the surface and below the top of wharf. (See Fig. 4.) Between these fender piles and the outside stringer are placed a nest of heavy spiral springs similar to those used on a buffer in a freight car. This is the only direct connection between the wharf proper and the fenders; the upper ribbing at the surface of the wharf acts in the dual capacity of a curb for the wharf and a support for the fender line. This spring fender line saves the jar to both vessel and wharf and in ordinary choppy weather there is not the slightest motion to the wharf; it also saves the wear on the fender piles as these last but from one to two years, due to wear and breakage. For example, in pier No. 12, San Francisco, used by the United States transport steamers, the fender piles with the spring system have been in use since 1896 without a single renewal, while at pier No. 4 used by steamers of half the tonnage, all the fenders have been renewed twice in that period of time. There are at present constructed in San Francisco harbor and in course of construction, seven of these wharves 100 feet wide, 600 feet long, and six wharves 120 feet wide and 800 feet long, aggregating a cost of \$1,000,000, and also at Long Beach, Cal., near Los Angeles, a double deck pleasure wharf costing \$100,000. The cylinder pier system construction has been used by the Santa Fe System, the North Shore Railroad Company, and the San Francisco, Oakland and San Jose Railway Company, and is to be used by the Pacific Mail Steamship Company in the construction of four new piers. See Dock; Pier.

HOWARD C. HOLMES,
Chief Engineer, San Francisco Dry Dock Co.

What Cheer, Iowa, city in Keokuk County; on Coal Creek, and on the Chicago & N., and the Burlington, C. R. & N. R.R.'s; about 70

miles southeast of Des Moines. It is in an agricultural and coal mining region, and has several industries connected with farm and dairy products. It has six churches. The two banks have a combined capital of \$80,000. Pop. (1880) 719; (1890) 3,246; (1900) 2,746.

What-cheer, in Rhode Island, a watchword or shibboleth, derived from the fact that the Indians of the colony thus greeted Roger Williams and his companions, when they first landed on the Sekonk River near the present site of Providence.

Whatcom, hwōt'kōm, Wash., city, county-seat of Whatcom County; on Bellingham Bay, and on the Great Northern, the Northern P., and the Bellingham Bay & B. C. R.R.'s; about 79 miles north of Seattle. It has an excellent harbor, and steamer communications with the Puget Sound and the Pacific ports. A State road extends over the Cascade Mountains, across the Mount Baker Pass, to the gold and silver mines and to the grazing lands on the Columbia River. Four miles from the city is the Corn-wall coal mine. The water-supply (gravity system) is obtained from Lake Whatcom, four miles distant. The city has a good sewerage system, electric-light plant, and electric railway. The court-house, city hall, schools, and churches are the principal buildings. It has the State Normal School, a high school, graded elementary schools, and a library. The three banks have a combined capital of \$215,000 and deposits (1903) amounting to \$1,251,280.

In December 1890 the old city of Whatcom and the town of Sehome were consolidated and called New Whatcom. In 1901 the name was changed to Whatcom. Pop. (1890) Whatcom, 4,059; Sehome, 2,700; total, 6,759; (1900) 6,834; (1904) est. about 9,000.

Whately, hwāt'li, Richard, English prelate, Archbishop of Dublin: b. London 1 Feb. 1787; d. Dublin 8 Oct. 1863. He was educated at Oriel College, Oxford, and in 1819 made his first appearance as an author by publishing his since famous 'Historic Doubts relative to Napoleon Bonaparte.' This pamphlet is among the most popular of the author's writings, more than 12 editions of it having been published. Its object is to show that objections of the same kind as those brought forward by skeptical writers of the truth of the gospel narratives, founded on apparent inconsistencies and absurdities in these narratives, may be brought against any well known and incontrovertible piece of history, such as that of Napoleon Bonaparte. In 1822 Whately delivered the Bampton lectures at Oxford, 'On the Use and Abuse of Party Feeling in Matters of Religion.' The same year he received the living of Halesworth in Suffolk, and was appointed principal of Saint Alban's Hall, Oxford, in 1825. In 1825 he published 'Essays on Some of the Peculiarities of the Christian Religion' (7th ed. 1860). A second series of essays 'On Some Difficulties in the Writings of Saint Paul and in Other Parts of the New Testament' appeared in 1828 (6th ed. 1849); and a third series, 'The Errors of Romanism traced to their Origin in Human Nature,' in 1830 (5th ed. 1856). In 1825 was published perhaps the most widely known of his works, 'The Elements of Logic,' and the scarcely less popular 'Elements of Rhetoric' in 1828. Both have passed through many editions, and like all his

WHEAT

writings are marked by force of style, clearness of arrangement, and homely yet felicitous illustration. Whately was appointed professor of political economy in 1830. The lectures he then delivered were afterward published under the title of 'Introductory Lectures on Political Economy.' In Oxford Whately stood in the front rank of those who held liberal views in ecclesiastical and social matters, and among these his earnest love of truth, his contempt for arguments resting solely on tradition, and the keenness of his logic, gave him great influence. By his theological and other writings, and by the part he had taken in political affairs, especially the support he had given to the Catholic Emancipation measure, his name and abilities became well known, and 1831 he was appointed archbishop of Dublin and bishop of Glendalough. The cause of national education in Ireland he warmly embraced, and for 20 years was an active and influential member of the board. But in 1853, Dr. Cullen and the Roman Catholic party having objected to a treatise on the 'Evidences of Christianity,' composed by Whately, and used in the schools, and having procured its withdrawal, the prelate resigned his seat at the board. Whately was distinguished by honesty, love of truth, and princely liberality. In manner he was somewhat rough and careless—the reaction, as he said, from the painful sensitiveness with which he had been troubled in his youth. His conversation was rich in joke, and pun, and witty repartee; and he was fond of trapping and puzzling his opponents by logical quibbles, though no man could be sharper in detecting a fallacy in another's reasoning. Consult 'Life and Correspondence of R. Whately, D.D.,' by his daughter, E. J. Whately (1866).

Wheat. Wheat belongs to the Hordeæ tribe of the Graminea or grass family. There are four principal kinds or sub-races: common wheat (*Triticum sativum vulgare*), Egyptian and English wheat (*Triticum sativum turgidum*), flint wheat (*Triticum sativum durum*), to which the durum and macaroni varieties belong, and a dwarf variety (*Triticum sativum compactum*), supposed to have been the kind produced in ancient times. Each sub-race is in turn divided into many varieties. The wheat most generally cultivated and in most common use for bread purposes is *Triticum sativum vulgare*, although varieties of durum and spelt are extensively grown in some localities.

Wheat is of ancient origin and was cultivated by prehistoric races, as the Swiss Lake-Dwellers. In the earliest writings it is mentioned, and samples which are not materially different from similar modern varieties have been found in a fair state of preservation in ancient tombs. Attempts have been made to germinate this "mummy wheat," but without success. The Chinese claim that wheat was used by them as food 2,700 years before the Christian era and in Egypt its use as food appears even to ante-date this period. A number of varieties have been cultivated from early times, as spelt, durum, and winter and spring varieties of *Triticum sativum vulgare*. Wheats produced in different countries have been subject to different climatic and soil conditions as well as to different methods of cultivation until material changes have taken place and numerous hard and soft varieties have been produced. There

appears to be no authentic record of wheat growing wild and sowing itself without the help of man.

The world's wheat crop normally amounts to about 2,720,000,000 bushels, of which the European countries produce a little more than half. At present the United States is the greatest wheat growing country. In 1901 the yield was over 720,000,000 bushels. There are large wheat areas in the northwestern possessions of British North America which have not yet been brought under full cultivation. This will increase the wheat producing belt of North America by adding a strip about 1,500 miles long by 300 miles broad. There also are large undeveloped wheat regions in South America, particularly in the Argentine Republic, and it is claimed that some parts of Siberia are suitable for wheat production. Thus it is evident that there are vast areas of fertile virgin soil yet to be brought under wheat cultivation.

Wheat can be grown on a variety of soils. It thrives best, however, and produces largest yields upon rich alluvium, and soils formed from different kinds of rock thoroughly disintegrated and mixed with vegetable mold. The wheat soils of the northwestern wheat region of the United States are largely of glacial formation and composed of clay and silt with small amounts of fine sand and containing liberal amounts of alkaline matter, particularly disintegrated limestone. The best wheat soils are rich in humus (decaying vegetable matter), which through decay supplies nitrogen, one of the principal elements used by the wheat plant for the formation of gluten. The chemical composition of a wheat soil of high productiveness from the Red River Valley of the North is as follows:

	Surface per cent	Sub soil per cent
Insoluble matter	47.64	41.21
Soluble silica	15.43	8.37
Potash	0.54	0.25
Soda	0.45	0.48
Lime	2.44	7.45
Magnesia	1.85	4.48
Iron oxid	4.18	3.48
Alumina	7.89	10.72
Phosphoric anhydrid	0.38	0.17
Sulphuric anhydrid	0.11	0.10
Carbonic anhydrid	2.42	14.26
Volatile matter	15.55	6.22
Humus and volatile matter..	5.34	0.89
Nitrogen in volatile matter..	0.38	0.11

The tendency in wheat farming upon new soils has been to grow the crop for a number of years without practising rotation or using fertilizers. After a time this results in reduced yields and an inferior crop, due in part to the loss of nitrogen from the land. Wheat does not remove a large amount of gross fertility from the soil, but exclusive wheat culture on virgin soil causes a rapid decay of the humus and a consequent loss of nitrogen, one of the elements of which humus is composed. When wheat is grown along with other farm crops in a good rotation and manures are intelligently used the wheat does not have an exhausting effect upon the soil.

The yield of wheat ranges from 10 bushels and less to 30 bushels and more per acre. In countries where land is expensive, and intensified farming is practised, the yield per acre is

WHEAT

generally larger than in new regions where more land is available. The yield per acre of wheat in the United States is much less than the soils are capable of producing.

Formerly plowing was done with a bent stick or wooden plow, the wheat was sown broadcast by hand, the crop was cut with the cradle and bound in sheaves by hand, and finally thrashed with the flail or by the trampling of horses. Improvements in machinery, as steam and gang plows, seeders, reapers, self-binders, and thrashers, have greatly reduced the cost of production and increased the world's supply of wheat. Equally as great have been the advances in transportation, storage and milling facilities. Wheat is now transported in specially constructed freight cars and boats, and stored in large elevators in which 120,000 bushels are placed in one compartment, when formerly it was often transported on horse or mule back in bags, loaded and unloaded by hand and stored in small bins in granaries. The milling process has developed from crushing between two stones to reduction by steel rolls.

Wheat is subject to a number of diseases, as rusts, smut, and other vegetable parasitic diseases, many of which have been studied and are now in part capable of being controlled. The smuts are destroyed by treating the seed wheat with chemicals which kill the smut spores, while the rusts are held in check by destroying the host plants, as the barberry, upon which the parasite spends part of its cycle of life. There are a number of insect pests which often cause great destruction of the crop, as grasshoppers, frit flies, Hessian flies, and chinch bugs. Economic entomologists have done much to save the wheat crop from insect ravages.

The wheat kernel is surrounded by a seed pod composed of cellulose which constitutes the outer layer and is called the pericarp. The second covering or epispem, which is just within the pericarp, consists of the outer and inner integuments. The perispem or third bran layer is a thin mass of collapsed cells. The aleurone layer—so-called gluten cells—is composed mainly of nitrogenous matter and lies within the three-bran layers. The endosperm or floury portion constitutes about 80 per cent of the wheat kernel and is within the three-bran layers and aleurone cells. The germ or embryo plant is stored in the lower part of the kernel where its outline can be traced by the indentations. The germ makes up about 6 per cent of the kernel, the bran layers about 10, while about 86 per cent is present in the aleurone and endosperm. The relation of the different parts, one to the other, as bran to endosperm, varies in different kinds and varieties of wheat, some producing a larger amount of flour than others and some more bran.

The character of the wheat, as starchy or glutinous, is determined largely by soil and climate. A short, forcing growing season and a fertile soil have a tendency to produce glutinous wheat, while the opposite conditions produce starchy wheat. When hard glutinous seed wheat is sown in regions which produce starchy soft wheats, the hard wheat gradually changes its character and in about two years becomes starchy. Whether a wheat is hard or soft depends upon the amount and character of its gluten. Hard wheats usually contain over 12 per cent gluten, of which 55 to 65 per cent is in

the form of gliadin, an alcohol soluble proteid, while soft wheats contain less gluten, but gluten of a higher gliadin content. See article on BREAD AND BREAD MAKING for influence of gluten on quality of bread.

Extensive experiments have been performed by Lawes and Gilbert of Rothamsted, England, to determine the influence which different kinds of fertilizers have upon the wheat crop. They have shown that fertilizers influence the yield more than the composition of wheats and that it is not possible by means of fertilizers alone to materially increase the amount of starch or gluten. Climatic conditions effect the composition to a greater extent than do fertilizers. Wheats grown upon the same soil in different years show greater variations in composition than wheats grown the same year but differently fertilized.

Different varieties of wheat when grown under the same conditions are fairly constant in composition. In protein content, wheats range from 8 to 18 per cent. The most nitrogenous wheats do not necessarily make the most glutenous flours, as frequently a large portion of the nitrogen is in the germ and offals.

The grading of wheat is based entirely upon the physical qualities as weight per bushel, color, and plumpness. Smut and blemishes, caused by unfavorable climatic conditions, are also considered in grading wheat. When new wheat is stored in elevators, a slight fermentation change takes place known as "sweating." If the wheat is sound this change is slightly beneficial for flour production, as it increases the keeping qualities of the flour. Unsound wheats, as those which are bleached, frosted, immature and sprouted, usually have a somewhat different composition from fully matured wheat. Such wheats usually contain a larger amount of soluble proteids, soluble carbohydrates, and organic acids than normal wheats. Damaged wheats generally yield a smaller amount of flour as well as flour of poor keeping qualities.

It is not possible to make accurate comparisons as to composition of wheats grown in different countries. It will frequently be found that wheats grown in different localities of the same country vary as much in composition as do wheats grown in different countries.

Wheat contains slightly more protein and less starch than corn, oats, rye, or barley. Oats from which the hulls have been removed contain more protein and fat than wheat. The difference in composition between wheat and the other cereals is not large and occasionally individual samples of corn or rye will be found containing more protein than individual samples of wheat. Wheat differs in composition from all other cereals in that its gluten is composed of the two proteids, gliadin and glutenin. This gives flour its bread-making value. No other cereal except rye contains a gluten that is capable of expanding and forming a light porous loaf. Because of its unique composition no other cereal can take the place of wheat for bread-making purposes.

Numerous experiments have been made to improve the quality of wheat by selection of seed, and by breeding and crossing of standard varieties. Wheat responds readily to such tests, but unless great care is taken it as readily reverts to its original condition. In the United States two main classes of wheat are produced,

WHEAT PRODUCT OF THE UNITED STATES, BY STATES (MILLIONS OF BUSHEL)

WHEATEAR—WHEAT INSECT PESTS

namely: winter and spring wheat, of which there are a number of varieties, as white and red winter wheat, Oregon Club, Blue Stem, Scotch Fife, etc. Minnesota, North and South Dakota, and northern Iowa constitute the main spring wheat region; spring wheat is, however, grown in other localities.

The wheat plant assimilates its mineral food and nitrogen from the soil at a rapid rate. In the case of spring wheat, by the time the crop is half grown, over three fourths of the mineral food and nitrogen needed for construction purposes have been taken from the soil. Wheat is not a strong feeding plant and taking its food from the soil in so comparatively short a time, the soil must be in a high state of productiveness in order to yield a good crop. The wheat plant needs greatest assistance in securing its nitrogen, hence fertilizers for wheat should be nitrogenous in character. Wheat also needs a good supply of available mineral food as phosphoric acid and potash, but is better able to secure these elements from the soil than it is nitrogen.

The flour yield of wheat is determined approximately from the size and weight of the kernels. According to Foster, the weight of 100 average kernels can be taken as the basis for estimating the flour yield:

WHEAT KERNELS	Weight troy grains	Contains per cent of flour
100	46	74.1
100	44	73.6
100	42	73.2
100	40	72.6
100	38	71.8
100	36	71.0
100	34	70.3
100	32	69.6
100	30	68.7
100	28	67.6
100	26	66.8
100	24	66.0

Because of its usually high price, wheat has never been extensively used as animal food, but at times when it has been cheap and abundant, it has been used for the feeding of all farm animals and has proven equally as valuable as other grains for the production of beef, pork, mutton, and milk. In the feeding of wheat to farm animals, the best results are secured by coarsely grinding or pulverizing the grain instead of feeding it whole. The main use of wheat, however, is to manufacture flour for human food. It is used more extensively as human food than any other cereal.

HARRY SNYDER,
Professor of Agricultural Chemistry, University
of Minnesota.

Wheatear, or Fallow-chat (*Saxicola ananthe*), an European terrestrial warbler, allied to the stonechat. Its average length is 6½ inches, and its color is gray above, the wings being tipped with black; a black streak encloses the eye and ear-coverts. The breast is brown and the under parts white. The wheatear is much sought after when in good condition as a table bird, its flesh being very delicate and is usually caught in traps. By the British peasants the wheatear's presence is regarded as a sign of ominous and unfavorable kind; and probably the fact of the nest being often found in collections of old stones in burial-places has tended to in-

crease the superstitious feeling. The nest is buried deeply among stones or in rock-clefts, the eggs being of pale-blue color, and numbering from four to six.

Wheat Insect Pests, insects injurious to growing wheat-crops. These number from 50 to 100 different kinds in the United States alone, many of which have been imported from the Old World; and they represent a wide variety of forms and classes. The most important, probably, are flies, more or less closely related to the house fly and mosquito; and of these the Hessian fly is the most dreaded and widespread. This is a small fly (*Cecidomyia destructor*) of the family *Cecidomyiæ*, the larva of which is very destructive to wheat, barley, and rye, but does not attack oats. It is named from the unfounded belief, that it was brought to America from Europe (where it is native, and has been a pest for centuries) in the baggage of the Hessian mercenaries employed against the Americans in the war of independence. The female fly is about a tenth of an inch in length. Its body is brown, with the upper parts, the thorax, and the head of a darker shade, approaching to black. The wings are dusky gray, and are surrounded with fringes. The male is somewhat smaller than the female, and has longer antennæ. The female flies usually lay their eggs on the young plants twice in the year, in May and September, the maggots being hatched in from 4 to 14 days. These work themselves in between the leaf-sheath and the stem, and fix themselves near the lowest joints, often near the root, and suck the juices of the stem, so that the ear falls down at a sharp angle. These maggots turn to pupæ ("flaxseed") from which the flies develop in about ten days; those of the fall brood hibernate in the pupa state, and are ready to begin their depredations with the early sprouting of the spring crop. In view of these habits, wherever the presence of these insects is known or suspected, the winter wheat should be planted as late as possible, or the early planting of a "trap" strip at one side of the field. In this the flies will lay their eggs, after which the strip may be plowed under and the young destroyed; volunteer wheat should be destroyed and stubble burned.

Other true flies attacking wheat and other grain-crops are mainly of the family *Oscinidæ* which contains a large number of species of variable habits, those of interest in the present connection mainly inhabiting the stems of grains and grasses. Here belongs the frit-fly of Europe, so terribly destructive both in Great Britain and on the Continent, and many species in this country whose depredations are insignificant or local or obscure. That one of most consequence, and most thoroughly studied is the "wheat hulk-worm" or "wheat stem-maggot" (*Meromyz americana*), which has been a constant evil ever since civilized agriculture began here. It is a native of the whole of North America, apparently, originally feeding on the wild grasses. In the middle latitudes of the United States three annual broods develop; there are more farther south, but only two in Canada. The life-cycle of this insect within the wheat-belt of the United States, according to Webster, is as follows: The winter is passed in the larval stage, and the short pupal stage coming in May brings the emerging of the adults

WHEAT STARCH

at the time when the female is able to place her eggs on the plants where the young, on hatching will make their way to the tender and succulent stem just above the upper joint. By the time the straw has ripened the larvæ have ceased to require food, and pass through the pupal stage, the adults of this brood appearing in July. Eggs are now deposited in volunteer wheat and grass, and, owing either to the retarding effects of meteorological influences or a diversity of food of the larvæ or both, perhaps, the emerging of the adults is prolonged throughout a period extending from late August through September until late October. At this period the fall wheat offers a decidedly inviting plant to the female fly on which to place her eggs with a prospect of her progeny having an abundant food supply. It is the larvæ from eggs deposited during this period that winter over in the plants and give rise to the May-June generation of flies. It is this last brood that is of more especial interest to the farmer, as it is very seldom that the pest does serious injury to grain except in fall and early spring. The effect on the plant is this: in young plants the central spindle-shaped enfolded leaf is killed, the detached portion turning first yellow and later brown, then shriveling up and dying, leaving the outer lower leaves uninjured. In Hessian-fly attacks this spindle-shaped leaf is absorbed and does not appear at all in young wheat in autumn, so that there need never be any confusion of the work of these two insects in fall wheat, and the effect on the full-grown straws is even more easily distinguishable. When attacked by the maggots of this species the fully grown straw withers at the upper joint, and all that portion of the stem including the head, the sheath excepted, changes to a whitish color, the remainder of the plant, including the upper sheath, continuing uninjured and of the usual green color. The Hessian fly never affects the full-grown straws in this manner and the lesser wheat stem-maggot (*Oscinis carbonaria*) does so but rarely, so that the presence of these maggots in the straw can be easily detected shortly prior to harvest by their whitened color from the upper joint upward. The larvæ are within the stem and not outside and under the sheath, as with the Hessian fly; they are larger and of a more glassy green color than those of the lesser wheat stem-maggot, and it is only when still very young that the ordinary farmer need ever mistake them for any of the others mentioned in this article. The liability of attack from this insect is not sufficiently great to warrant expensive preventive measures. It occasionally comes in vast numbers, but no way is yet known of foretelling these epidemics. The same precautions and methods as those taken against the Hessian fly are recommended. Several other species of *Oscinis* are known, among which the American frit-fly (*O. soror*) may prove formidable hereafter, as it has already committed extensive depredations in Minnesota. The more careful and cleanly the method of farming, the less are these and other insect pests to be dreaded.

The chinch-bug is another far too prevalent plague of grain-fields; it is, indeed, regarded as the most destructive insect in the country. It is a small blackish plant-bug (*Blissus cucumerus*), with white wing-covers each marked with a dark line like a figure 6. Arising from her winter sleep in the old grass and rubbish of the

fields and fence-corners, the female lays several hundred eggs on the stems and roots of the sprouting grasses and grains near her. The young hatch quickly, and in a crowd of reddish dots suck out the juices of the growing plants, causing them to wither and die. There is another brood in the fall. Severe winters and wet and cold springs reduce the numbers of this pest, and certain diseases are known which spread among the bugs and destroy them. Infected bugs have been sent from diseased districts to other regions and imparted to the bugs there with good effect. There seems to be no preventive, however, except great care in burning stubble and rubbish, keeping the fields clean, and planting as late as possible.

Another group of highly injurious insects is found in the family *Chalcididae* (q.v.),—a family of gall-flies with one genus (*Isosoma*), whose species prey upon growing plants of this kind and are called "straw-worms" or "joint-worms," because their larvæ attack the nodes or "joints" of the grain-stem. The species of special interest as affecting wheat is *I. grande* (or *I. tritici*). This gall-fly is about an eighth of an inch long and black, with a body shaped much like that of an ant and four dark wings. When, in the spring, the young wheat plants are only starting to throw the stem upward, the females (at that time minute and wingless) push their ovipositors through the stem until they penetrate the head of the embryo plant within and leave an egg there. The larva soon hatching devours this vital part of the plant and kills it, though the stem may continue to grow for some time. By the middle of June the young have developed and cut their way out to appear as the adult summer form, which wander widely. These mature, winged females now deposit eggs within the stems of wheat just above the uppermost joint, where a hardy woody gall forms about the larva, within which it transforms into the pupa stage and stays on, inert, through the winter. The best preventive measure is an annual rotation of crops; next to that the burning of the stubble, purposely left long, but this must be done not later than early September. Various other species of *Isosoma* attack other grains, especially barley and rye, and some others also injure wheat.

Purples, ear-cockle or peppercorn is a disease of British wheat, produced by a minute nematoid worm called "wheat-eel" (*Vibrio tritici*), which are placed by their parents in the germ of the seed, and cause the formation of the purplish-black galls or "cockles" which are a feature of the disease, and in which the worms are contained. When fully grown they may attain a length of a quarter of an inch.

The Department of Agriculture has issued a large number of special illustrated publications upon the insects injurious to wheat and other grains, which should be consulted. Prominent among them are Marlatt, 'The Principal Enemies of Growing Wheat' (1901); Webster, 'Insects Attacking the Stems of Growing Wheat,' etc. (1903); Osborn, 'The Hessian Fly in the United States' (1898); Webster, 'The Chinch-bug' (1898).

Wheat Starch. The history of wheat starch dates back to the ancient Greeks and Egyptians. They evidently understood its qualities and experimented with various kinds of

BREEDING NEW WHEATS.

TESTING NEW WHEATS IN THE LABORATORY

WHEAT STARCH

wheat. Pliny speaks of starch made by the inhabitants of the Island of Chios with the remark that starch made from summer wheat was preferred. They used it for medicinal purposes and for food. In Continental Europe wheat constituted the principal source of starch for centuries. It was heard of in England as early as 1511, but not much used until about 1564. In Queen Elizabeth's time its use was made popular for stiffening those enormous ruffs so much worn at that time, and as a powder for the hair. According to Planche, "Mistress Bingham Vandt Plasse, a Fleming, came to London and publicly taught the art of starching"—Stubbs falls foul of this "liquid matter which they call starch, wherein the devil hath learned them to wash and dive their ruffs, which being dry will then stand stiff and inflexible about their necks." During the reigns of Queen Anne, and the Georges I., II. and III. and until 1833, to use any other substance was prohibited under severe penalties, restrictions and taxes. As the cotton factories of England and France were built, the demand for wheat starch accordingly grew.

In the United States small factories sprung up in different places about the beginning of the last century. In 1803 a patent was granted to J. Naylor, by which he made spirits from the wash-water obtained as a by-product in the manufacture of wheat starch. Another patent was granted in 1810 to E. Perkins of Shrewsbury, N. J., on a process for making starch from wheat, and spirits from the residuum. In 1829 Stephen Liversidge purchased a water power mill at Dorchester, Mass., and made wheat starch for the New England cotton mills. He was prosperous, and in 1841 added steam power. He continued until 1855, when his factory was destroyed by fire and was never rebuilt. Other factories were built at Roxbury and at Watertown, Mass. At the latter place it was made mostly for family use, and put up in boxes holding 48 pounds each. This is the only one of the early factories still in existence, and is conducted by the firm, H. Barker & Co., of Boston, Mass. In 1842 Thomas Kingsford was the superintendent of a wheat starch factory belonging to W. Colgate & Co. of Jersey City, N. J., and experimented with corn as a material for making starch. His success led to his establishing the first corn starch factory at Oswego, N. Y., in 1848. Up to this time wheat starch was the principal kind sold by grocers. At present the various brands sold for family use are all made from corn, although starch made from wheat is superior both for culinary and for laundry purposes. At normal conditions of the market wheat starch costs about twice as much as corn starch. Being considered expensive its use is therefore confined to doing the best quality of work, and is used by experts who understand its superior qualities. For the finishing of cotton and linen textiles and as a carrier of colors in printing cotton goods, the best results and the finest effects are obtained by its use.

When examined under a microscope the granules are small and are found to differ greatly in size, varying from 0.05 to 0.01 m.m. in diameter, actually showing two classes of granules both of them shaped like circular disks. It is characterized by certain qualities which do not belong to either corn or potato starch. It enters the fabric and forms a body within instead of a coating on the outside, thus mak-

ing it possible to get a better finish and show the clean, clear texture of the goods. It adds weight by filling the meshes, and is tough and flexible. It better resists moisture and perspiration. Being possessed of these qualities it is thoroughly adapted to doing fine laundry work, and is in fact indispensable to the manufacturers of collars, cuffs, and shirts in laundering their goods which is more difficult the first time. Many laundrymen try to cheapen the cost by using other starch. This is readily detected by observing that the collars and cuffs break to form joints and do not possess the qualities mentioned above. The modern laundry industry is a growing one and the foundation for its finest work is wheat starch. In 1891 the Crystal Springs Company of Watertown, Mass., discovered that the penetrating quality of starch could be increased by partially dextrinizing it. This was the first of the "thin boiling" starches, which have been in considerable demand since.

The consumption has gradually increased from year to year until the amount used in this country is about 18,000,000 pounds, requiring annually about 700,000 bushels of wheat for its production. None is exported. The factories are scattered through the East and Middle West.

In the manufacture of starch from wheat as well as from other cereals, it is necessary to loosen the particles of the grain by disintegration so as to break up the cellular tissues. When this is accomplished it is not difficult to separate most of the granules which are thus laid bare by simply washing them out with water and breaking them loose from the other substances. A part of the starch in wheat is in a very close mechanical combination with some of the gluten, and is not easily separated. This glutinous starch is considered to be a compound of the unripe or undeveloped starch and gluten substance. If the process is complete, the three principal products obtained are starch, gluten, and gluten starch. There are three processes in use in this country: By acidulous fermentation of the wheat, by the fermentation of flour and by treating flour mechanically, in which the gluten is separated without either chemicals or fermentation. Most manufacturers employ the old fermentation process, which is cheaper and enables them to use unsound or weak flour, which can be purchased at low prices. The gluten is washed away as it ferments, leaving the starch at the bottom of the tanks. By repeated washings it becomes freed from other substances and is allowed to settle. It is then cut into cakes and placed into drying chambers to crystallize and dry. For the past years the writer has been making wheat starch by a process in which all the products are saved. The flour is placed in machines which wash out the starch and gluten starch together under a constant flow of water leaving strong, elastic gluten (q.v.) by itself. This being perfectly fresh and sweet, is dried by a special process, ground into flour, and put on the market as Gum Gluten. An average of only 16 pounds of dry gluten is retained from a barrel of flour. The demand is mostly from those suffering from diabetes mellitus and such as are selecting a vegetable protein instead of too much meat. The dietetic value of gluten has been recognized by scientists for years, and it is to be regretted that a loss of such a valuable food

WHEATLAND — WHEATON

substance has been going on for centuries. The gluten starch together with the starch runs from the washing machinery as a milky liquid into wooden tanks, where it is allowed to settle. The heavy starch particles go to the bottom, while the gluten, having less specific gravity, forms a layer on top, and the water which forms the greatest bulk can be drawn off. In appearance the gluten starch is gelatinous and somewhat darker than the starch. It has not been considered of any great commercial value and has been allowed to run away with the water. In 1902 the writer took out patents for making it into a dry powder that turns to a wet adhesive paste by mixing with cold water. It is known on the market as "Jellitac," and is used for sticking on labels, for hanging wall-paper, for bill-posting and wherever wet paste is used. In thus making use of the by-products, especially when they have a superior value, is in a national economical sense, an attainment of the highest importance. For references read the United States Census Bulletin (198), published in 1902, United States Patent Reports and Histories of Manufacturers by Clapp and by Bishop. See STARCH.

ARTHUR S. HOYT,

Manufacturer of Wheat Starch, New York.

Wheatland, a famous estate and former residence of President James Buchanan, located a mile from Lancaster, Pa.

Wheatley, hwē'tlī, **Francis**, English painter: b. Wild Court, Covent Garden, London, 1747; d. London 28 June 1801. In early life he carried off several premiums given by the Society of Arts and was employed by Mortimer in decorating the ceilings at Broomfield Hall. He set up as a portrait painter at Dublin, and was much employed on small whole-lengths, among his sitters numbering many members of the Irish House of Commons. Becoming involved in a scandal he left the Irish capital for London and between 1765 and 1783 exhibited many pictures classed as "domestic," but his works also included the 'Riots of 1780,' the original of which perished in a fire, although Heath's engraving of it gives a good idea of the work. As a contemporary of Morland he was superior to that painter in the refinement both of his subjects and his treatment of them, and was really masterly in his handling of equestrian portraits, such as 'The Second Duke of Newcastle and a Shooting Party.' He was elected R.A. in 1791. He is an important figure as being one of the founders of English rural genre, and painted pretty and graceful rustic figures of women and children, while his sense of landscape coloring was really exquisite.

Wheatley, Henry Benjamin, English philologist and bibliographer: b. Chelsea 2 May 1838. He was clerk to the Royal Society 1861-79, honorary secretary to the early English Text Society 1864-72 and its treasurer 1872-1901. Besides editing for the Text Society 'The Romance of Merlin' (1865-99) and other works he is the author of 'Anagrams' (1862); 'What is an Index?' (1879); 'Samuel Pepys and the World he Lived In' (1880); 'How to Form a Library' (1886); 'London Past and Present' (1891); 'Literary Blunders' (1893); 'Historical Portraits' (1897); etc.

Wheatley, Phillis, American-African verse writer: b. Africa about 1753; d. Boston 5 Dec.

1794. She was brought to Boston in 1761, was purchased by Mrs. Wheatley, and, exhibiting a fondness for books, was instructed by her mistress and her daughters, and acquired for the time a superior education, reading Latin with facility. At an early age she began to express her thoughts in verse, and some of her poems written at 14 give evidence of poetic ability. At 19 she visited England, where she attracted much attention. A volume of her poems dedicated to the countess of Huntingdon was published there, containing her portrait, and bearing the title, 'Poems on various Subjects, Religious and Moral, by Phillis Wheatley, Negro Servant to Mr. John Wheatley of Boston, in New England.' After her return from England she published several poems, among others an address to Gen. Washington. Her book was reprinted in Boston and passed through several editions. The family of Mr. Wheatley being broken up by death soon after her return, she married a negro named Peters, and her last days were spent in extreme want.

Wheatley, Richard, American Methodist clergyman: b. near York, England, 14 July 1831. He received an academic education, was ordained in the ministry and since his removal to the United States has been engaged extensively in literary work. His writings include: 'Cathedrals and Abbeys in Great Britain'; 'Biographic Encyclopedia of the New England States in the XIXth Century' (5 vols.); 'History of the World from the Middle Ages'; etc.

Wheaton, hwē'tōn, **Frank**, American military officer: b. Providence, R. I., 8 May 1833; d. Washington, D. C., 18 June 1903. He was educated at Brown University, went to California in 1862, and studied law at Poitiers, France; lieutenant in the United States cavalry, subsequently participated in various Indian campaigns, and at the outbreak of the Civil War was promoted captain. He served with the Army of the Potomac through the war, was promoted brigadier-general of volunteers in 1862, commanded a division at Gettysburg and in the Shenandoah, and was engaged in other famous movements. He was made colonel in 1874, brigadier-general in 1892, and major-general in 1897. He was retired in the year last named.

Wheaton, Henry, American jurist: b. Providence, R. I., 27 Nov. 1785; d. Dorchester, Mass., 11 March 1848. He was graduated from Rhode Island College (now Brown University) in 1802, and studied law at Poitiers, France; he then took up the practice of law in Providence, and later (1812) moved to New York, where he was editor of the 'National Advocate,' until his increasing law practice caused him to give up that position in 1815. He was for a time one of the justices of the marine court in New York; and in 1816 became reporter for the United States Supreme Court; his reports, which were published in 12 volumes, are exceptionally complete and valuable. In 1821 he was a delegate to the New York State Constitutional Convention; and in 1825 was one of a commission for revising the statute law of New York. In 1827 he was appointed *chargé d'affaires* to Denmark, being the first regular diplomatic agent from the United States to that country, and resided at Copenhagen until 1835, when he was appointed minister resident to the court of Prussia. Two years later he was made minister

WHEATON — WHEEL AND AXLE

plenipotentiary by President Van Buren, which office he retained until 1846. His diplomatic work was most successful; in 1844 he negotiated a treaty with Germany, which, though rejected by the United States Senate, served as a basis for subsequent treaties. In 1843 he was elected a corresponding member of the French Institute, and in the following year a foreign member of the Royal Academy of Science of Berlin. He returned to the United States in 1847. His most important work is his 'Elements of International Law,' published in 1836, which has always been regarded as a standard authority on the subject; numerous editions have appeared in the United States, including one by Lawrence (1855), and one by Dana (1866); there is also an English edition and a French translation. His other writings include 'Digest of the Law of Maritime Captures or Prizes' (1815); 'Life of William Pinkney' (1826); 'History of the Northmen' (1831); 'Histoire du Droit du Gens en Europe, depuis la Paix de Westphalie jusqu'au Congrès de Vienne' (1841), translated into English in 1846; and 'An Inquiry into the British Claim of a Right of Search of American Vessels' (1842).

Wheaton, Lloyd, American military officer: b. Fairfield, Mich., 15 July 1838. He entered the Union army at the outbreak of the Civil War with rank as sergeant and served through the war, receiving promotion to captain of volunteers in 1862, major in 1863, and lieutenant-colonel in 1864. In 1866 he was appointed captain in the regular army, was subsequently employed on frontier duty, and on the outbreak of the Spanish-American war in 1898 he was appointed brigadier-general of volunteers, was assigned to duty in the Philippines in 1899, and in 1900 received rank as major-general of volunteers. He was engaged in all the important engagements in the Philippines, and in 1900-2 was in command of the departments of North Luzon and the Northern Philippines. He was promoted brigadier- and major-general in the regular army in 1901 and in 1902 was retired.

Wheaton, Ill., city, county-seat of Du Page County, on the Chicago & Northwestern Railroad; 25 miles west of Chicago. It is in an agricultural and stock-raising region. It has industrial establishments connected with farm and dairy products, and ships annually considerable hay, vegetables, wheat, flour, live-stock, and dairy products. The water-works plant cost originally \$60,000. The city has eight churches, Wheaton College (Congregationalist), a high school, opened in 1874, public and parish schools, a public library presented by J. Q. Adams, and a college library. Pop. (1890) 1,622; (1900) 2,345.

Wheaton College, located at Wheaton, Ill., 25 miles from the centre of Chicago. It had its beginnings in Illinois Institute, founded by the Wesleyan Methodists in 1856. In 1860 the Institute was sold to a board of trustees affiliated with the Congregationalists, and was chartered under the name of Wheaton College. The organization includes in addition to the regular collegiate department, an Academy, a Business Department, a Conservatory of Music, and an Art Department. Women are admitted to all courses. There are four collegiate courses offered, the classical, the literary, the Latin scien-

tific, and the English scientific; the degree of A.B. is conferred for the completion of any of these courses; before 1903, the three degrees of A.B., B.L. and B.S. were conferred. Certain studies are required of all students; and each course has in addition other required studies; the rest of the work is elective, the scientific courses having the least elective work. The academy offers four corresponding courses, and a teachers' course. The Business Department offers a business course, a shorthand course, and a course combining the two. An arrangement has been made with the American Sunday School Union of the Northwestern district by which a three years' scholarship is given to a young man who will spend six months each year in college, and six months in the missionary work of the Union. The college has a campus of 13 acres on a slight elevation in the city; the buildings are the main buildings, the Woman's Building, and the gymnasium. The library in 1904 contained 4,000 volumes; the Adams Memorial Library, a short distance from the College, is also open to students. The students in 1904 numbered 253, of whom 61 were in the collegiate department, 76 in the Conservatory of Music, and 112 in the Academy.

Wheatstone, hwēt'stōn, **SIR Charles**, English physicist: b. Gloucester February 1802; d. Paris 19 Oct. 1875. He commenced business for himself in London as a maker of musical instruments, and in 1823 attracted the attention of scientists by the publication in 'Thomson's Annals of Philosophy' of a paper entitled 'New Experiments on Sound.' In 1834 he was appointed professor of experimental philosophy in King's College, London, and in 1836 exhibited at King's College experiments showing the velocity of electricity. For this purpose he used a circuit of four miles of copper wire. These experiments suggested to him the idea of applying his apparatus to telegraphing. In 1837 with W. F. Cooke, he took out the first patent for magnetic telegraph, but no practical application of this was made till after the Morse telegraph had been operated. Another subject that engaged much of his attention was vision, on which he published various papers, among them a memoir contributed to the 'Philosophical Transactions' in 1848, 'On some Remarkable and Hitherto Unobserved Phenomena of Binocular Vision.' He was knighted in 1868; was a fellow of the Royal Society from the year 1836, and was also a corresponding member of the French Institute and honorary member of the principal academies of science in Europe. He wrote no considerable work, but was the author of numerous papers chiefly contributed to the 'Philosophical Magazine' and the 'Journal of the Royal Institution.'

Wheatstone's Bridge, in electricity, a well known form of the electrical bridge or balance for testing electrical resistance.

Wheel, The, in the southwestern United States, an agricultural league or guild, similar to the Granger movement. The first Wheel was founded in Prairie County, Ark., in 1880, and for some years the order increased rapidly.

Wheel and Axle, one of the mechanical powers, which consists of a wheel round the circumference of which a string may be wound, having a small weight attached to its free end,

WHEEL — WHEEL-GEARING

and an axle whose circumference, being smaller than that of the wheel, will sustain a heavier weight at the end of a string which is wound upon it in the opposite direction to that of the string on the wheel. The wheel and axle is merely a case of the lever; the small weight in ounces or other measure of weight multiplied by the radius of the wheel is equal to the balancing weight on the axle multiplied by the radius of the axle. The wheel is grooved, and carries a coil of rope; another rope is secured to the axis; and when the power is in motion every revolution of the wheel raises the weight to a height equal to the circumference of the axis or cylinder. The power is increased by enlarging the wheel or diminishing the diameter of the cylinder; but there is a limit beyond which the increase cannot be obtained with safety. The common winch, the windlass, the capstan, and the tread-mill are so many applications of the wheel and axle; and the same principle may be adapted to a train of wheel-work wherein motion is regulated and power acquired.

Wheel, Breaking on the, a horrible mode of punishment formerly in use in Europe. The condemned criminal was first fastened to two pieces of wood, in the form of a Saint Andrew's cross, with his legs and arms extended, and had the bones of his shins and thighs, and of the fore and upper arms, broken by blows with a bar of iron. After that he was attached to a small carriage wheel balanced on a stake, and allowed to suffer in this position till he died, sometimes several days after the breaking of his limbs. Later the punishment was so far mitigated that the criminal was put to death by a final blow on the breast, spine, or neck, before being exposed on the wheel, and sometimes he was strangled before even the breaking of his limbs took place. This punishment was abolished in France at the Revolution, and is now disused everywhere.

Wheel-bug, any of several species of cone-nose (q.v.).

Wheel-Gearing, a general term applicable to all forms of mechanical devices by which motion is transmitted by means of toothed or cog wheels. The different parts of a machine may transmit motion to each other by "direct contact," or by means of an "intermediate connector," in the latter case the motion of the connecting part being usually of no importance since the desired object is simply the proper

nism consists of a series of such elementary combinations, the motion being transmitted to each piece from the one immediately preceding it,

Skew Gearing.

and so on throughout the entire series; therefore, in order to ascertain the action of a complete machine, the "velocity ratio," and the "directional relation," of each combination of the series has to be determined. These factors depend upon the mechanical connection of the two parts, forming the combination, and are

Screw or Worm Gearing.

Bevel Gearing.

relative motion of the two parts thus connected. In elementary combinations of either kind, the part receiving the motion from the source of power is termed the "driver," and the part to which that motion is transmitted by the driver is termed the "follower." A train of mecha-

absolutely independent of the true velocities or directions of the parts themselves, which may or may not be liable to continual variation. For example, in two circular wheels, in contact with each other, and rotating upon fixed axes, the velocity ratio is constant. If the diameter of one is twice that of the other, the angular velocity of the larger will be one half that of the

WHEEL-GEARING

smaller, but during any changes of velocity whatsoever since the length of the respective radii of the wheels remains unchanged, the velocity ratio at any instant is the same. As to the directional relation: if the wheels are in internal contact, they will rotate in the same direction, and if in external contact, in opposite directions; but in both cases the directional relations will remain unchanged regardless of any change of the absolute direction of the driver. On the other hand, if the wheels are elliptical,

while the larger is commonly known as the "wheel." When the teeth are formed on the inner side of the wheel, or convergent to its centre, it is called an "annular" or internal wheel. Wheels in external contact rotate in opposite directions, but wheels in internal contact rotate in the same direction. As the diameter of the pitch circle of a "wheel" is increased, its curvature decreases and finally becomes a straight line, and results in a "rack and pinion" combination.

Face Gearing.

while the directional relation will remain constant, the velocity ratio will be subject to variation according to varying lengths of the contact radii. All elementary combinations may be divided into four classes — rolling contact, sliding contact, link work, and wrapping connections. The first two are direct methods, while the two last named communicate the motion through intermediate connectors.

The theoretical forms required to transmit motion by rolling contact are cylinders, cones, and hyperboloids of revolution. In the various forms of "friction gearing," employed to drive light machinery, the rolling pieces are made of different materials, one of wood and the other of iron, or one of them is covered with leather or rubber, and the necessary amount of adhesive contact is secured by adjusting the bearings of the pieces, or by the application of weights or springs. It is, however, impossible to transmit motion against any considerable amount of resistance by means of smooth surfaces, and various methods are resorted to, in order to secure the necessary resistance to slipping. Of these, the one most extensively used consists in the employment of teeth constructed upon the contact surface of the rotating pieces, and known under the general term of "gearing," which may be conveniently divided into five classes, according to the form of the pitch or contact surfaces of the equivalent toothed wheels, and designated as "spur" gears, "bevel" gears, "skew" gears, "screw" or "worm" gears, and "face" gears.

In spur gearing the wheels act upon each other in the same plane; the pitch surfaces are cylinders, and the teeth engage along straight lines parallel to the sides of the cylinders. The smaller wheel is usually termed the "pinion,"

Spur Gearing.

- (a) External Contact.
- (b) Internal Contact (annular).
- (c) Rack and Pinion.

In bevel gearing the wheels act upon each other at an angle; the pitch surfaces are cones, and the teeth engage along straight lines which pass through the common vertex of the two cones. When the angle of contact is equal to 45° they are called "mitre gears." In skew gearing the axles are neither parallel nor intersecting, the pitch surfaces are hyperboloids of revolution, and the teeth engage in lines approximating to the general direction of the common

WHEEL WINDOW — WHEELER

element of the hyperboloids. Owing to the difficulty of constructing the teeth, this class of gearing is not much used, and where the conditions require their application, two pairs of cone wheels are generally employed.

In screw gearing the axles of the cylinders are neither parallel nor intersecting, and the pitch surfaces are in contact only at one point. In its practical form it is known as "endless screw" or "worm gear," and is commonly employed to convert rapid into slow motion. The mounting of the screw prevents any other motion except that of rotation, so that at each complete turn of the screw, a tooth of the engaging wheel passes across the line of centres, and there being no limit to this action, the wheel continues to rotate so long as the screw is turned around its axis.

In face gearing, the teeth consist of pins arranged in a circle, and fastened to a flat circular plate attached to an axis. The wheels act at right angles to each other, and the points of contact are situated only upon the surfaces of the pins. Prior to the introduction of bevel gears, it was the method usually employed to transmit motion between axes that were not parallel, but at the present time it is almost exclusively used in connection with wooden mill machinery.

There are a great many other forms of gearing which are adapted for various purposes. Of them the stepped, twisted, spiral, and differential gearing are the most important. The particular advantage of the last named over ordinary spur gearing being the almost entire absence of friction and the consequent wear of the teeth. Bevel gears of this type have been used with great advantage in mowing machines. By the substitution of epicycloidal and hypocycloidal curves and involutes for the circular arcs in the forms of the teeth, the rolling contact action of the circles, in its relation to the production of a constant velocity ratio, is replaced exactly by a sliding contact action. The teeth of all gear wheels are designed upon the principles of these curves, so that when running together their action is smooth and free from vibration and shock.

Bibliography.—For specific information relative to the application and design of gearing, consult Rankine, 'Machinery and Millwork'; Grant, 'Teeth of Gears'; Kent, 'Mechanical Engineer's Pocket Book' (1903); and Stahl and Woods, 'Elementary Mechanism' (1903).

W. MOREY, JR.,
Consulting Civil Engineer.

Wheel Window, in architecture, a circular window with radiating mullions resembling the spokes of a wheel.

Wheeler, hwē'lér, Andrew Carpenter, American journalist and author: b. New York 4 July 1835; d. Monsey, Rockland County, N. Y., 10 March 1903. He began newspaper work on the *New York Times*, and later became city editor of the Milwaukee (Wis.) *Sentinel*. Soon after the outbreak of the Civil War, he went with the Federal army as correspondent for several eastern and western papers; and afterward, following two years of incidental writing for the Chicago press, joined the *New York Leader* staff, then numbering many prominent names. For a time he wrote for the *Leader* dramatic critiques over the signature "Trin-

culo." Then he became dramatic and musical critic of the *World*, and began writing the articles signed "Nym Crinkle." Later still he was on the staff of the *Sun*. As "Nym Crinkle" he published 'The Chronicles of Milwaukee' (1861); 'The Toltec Cup'; 'The Primrose Path of Dalliance'; 'The Iron Trail,' and other books. Latterly, having withdrawn from journalistic work, he published under the new pseudonym "J. P. Mowbray" (or J. P. M.), two series of essays and two books of fiction—'A Journey to Nature' (1901); 'The Making of a Country Home' (1902); 'Tangled Up in Beulah' (1902), and 'The Conquering of Kate' (1903). His authorship of these later works was not known until after his death.

Wheeler, Benjamin Ide, American college president: b. Randolph, Mass., 15 July 1854. He was graduated from Brown University in 1875, and afterward studied for four years in Germany, traveling also in Greece. He was subsequently engaged as an instructor at Brown, Harvard, and Cornell, and in 1886 was appointed professor of philology at the last named university, receiving the chair of Greek in 1888. In 1896 he accepted the directorship of the American School of Classical Studies, at Athens, Greece, and since 1899 has been president of the University of California. He was editor of the department of philology in Johnson's 'Universal Cyclopædia' and in Macmillan's 'Dictionary of Philosophy and Psychology,' and has written: 'The Greek-Noun Accent' (1885); 'Analogy and the Scope of its Influence in Language' (1887); 'Introduction to the History of Language,' joint author (1890); 'Organization of Higher Education in the United States' (1896); 'Life of Alexander the Great' (1900); etc.

Wheeler, Crosby Howard, American missionary: b. Hampden, Maine, 8 Sept. 1823; d. Auburndale, Mass., 11 Oct. 1896. He was graduated from Bowdoin in 1847, from the Bangor Theological Seminary in 1851 and in 1852 he was ordained in the ministry. He went to Smyrna in 1857, and in company with his wife labored as a missionary there for 39 years. He founded the Euphrates College in Harpoot and was its first president. During the great Armenian massacres in Harpoot in 1896 his home was destroyed and he was compelled to return to the United States. He survived the strain to which he had been subjected only about three months. He wrote: 'Letters From Eden' (1868); 'Ten Years on the Euphrates' (1868); 'Odds and Ends'; etc.

Wheeler, Joseph, American soldier and legislator: b. Augusta, Ga., 10 Sept. 1836. He was graduated at West Point in 1859, in the same year was ordered to duty at the Cavalry School in Carlisle, Pa., in 1860 was stationed at various posts in New Mexico, and engaged in scouting against the Indians. In April 1861 he resigned from the United States army, entered the Confederate service as 1st lieutenant of artillery, and was assigned to duty at Pensacola, Fla. In September of that year he was commissioned colonel and placed in command of the 19th Alabama infantry, with which he participated in the first campaigns in Kentucky and Tennessee. At the battle of Shiloh, in April 1862, he and his men were in the foremost rank, winning special commendation on the field

BENJAMIN IDE WHEELER.

PRESIDENT OF THE UNIVERSITY OF CALIFORNIA.

WHEELER

and in official reports. On the second day he took command of a brigade, and subsequently with the same command performed efficient services in the operations around Corinth. In July 1862 he was assigned to command of the cavalry division of the army of Mississippi, and immediately made a successful raid in west Tennessee. Later he was active in many of the operations of Bragg's Kentucky campaign, holding General Buell at bay while General Bragg took Mumfordsville, and further distinguishing himself in the battle of Perryville. In October 1862 he was made chief of cavalry in Bragg's army, and on the 30th of that month was promoted brigadier-general. He covered Bragg's southward retreat, greatly retarding Buell's advance. Commanding the cavalry in middle Tennessee, he took part in many engagements around Nashville, rendered effective service at Stone River, and then attacked the Federal lines of communication. In January 1863 he was made major-general. For many weeks he guarded Bragg's front, and when covering the retreat from Tennessee engaged in numerous actions. At Chickamauga and Chattanooga he commanded the cavalry, and on 21 September won a brilliant victory in Chattanooga Valley. In the retreat from Missionary Ridge he again covered the Confederate rear. Continuing his activity in east Tennessee, he raided the enemy's territory, fought sharp engagements, and in 1864 hovered on Sherman's flank during the great seaward march, annoying the Federals and covering many Confederate movements. Throughout the summer he was busy at various points, in July checked the raids of Stoneman and other Union generals, and in August operated with great success in the rear of Sherman, raiding to the Kentucky line and inflicting heavy damage. Then throwing his mobile forces in front of Sherman, he seriously interfered with the advance upon Savannah, the final evacuation of which was accomplished under Wheeler's protection. Raised to the rank of lieutenant-general in February 1865, he commanded the cavalry in General J. E. Johnston's army until the end of the war.

After the close of the conflict Wheeler practised law, and also became a cotton-planter; as a Democrat served in Congress from 1881 to 1889; was appointed (May 1898) by President McKinley a major-general of volunteers and placed in command of the cavalry division of the Army of Santiago in the war with Spain; commanded the troops at Las Guasimas; was senior field officer at San Juan Hill; and acted as one of the American commissioners in arranging for the surrender of Santiago. In 1899-1900 he commanded a brigade in the Philippines, and took part in several engagements. In February 1900, by order of the President, he inspected the island of Guam. In June of that year he was commissioned brigadier-general in the United States army, and he commanded the Department of the Lakes until September, when he was retired. He has published an 'Account of the Kentucky Campaign' (1862); 'Cavalry Tactics' (1863); 'Military History of Alabama'; 'History of the Santiago Campaign' (1898); 'History of Cuba, 1496 to 1899' (1899); 'History of the Effect upon Civilization of the Wars of the 19th Century'; and monographs on the lives of Admiral Dewey, William McKin-

ley, "Stonewall" Jackson, and Theodore Roosevelt.

JOHN H. CLIFFORD,

Editorial Staff, 'Encyclopedia Americana.'

Wheeler, Nathaniel, American inventor: b. Watertown, Conn., 7 Sept. 1820; d. Bridgeport, Conn., 31 Dec. 1893. He was engaged with his father in the manufacture of carriages, but about 1848 joined Allan B. Wilson in manufacturing sewing machines. In 1852, on the establishment of the Wheeler and Wilson Manufacturing Company, he became its president, and by his practical knowledge of machinery and ability as an organizer soon built up what was then the largest sewing machine factory in the world. Subsequently he served for six sessions in the Connecticut legislature; and invented and patented various improvements in sewing machines, railway cars, heating and ventilating apparatus, and wood finishing processes.

Wheeler, William Adolphus, American lexicographer: b. Leicester, Mass., 14 Nov. 1833; d. Roxbury, Mass., 28 Oct. 1874. He was graduated from Bowdoin in 1853, was engaged in teaching for several years, and subsequently assisted Joseph E. Worcester (q.v.) in the preparation of his 'Dictionary' (1856-9). He was afterward occupied with the revised edition of Webster's 'Dictionary' (1864) for which he compiled 'Explanatory and Pronouncing Vocabulary of the Names of Noted Fictitious Persons and Places, including Familiar Pseudonyms, Surnames, etc.,' which was issued separately in 1865. In 1867 he was appointed assistant superintendent of the Boston Public Library. He left unfinished an encyclopedia of Shakespearian literature and an index to anonymous literature entitled 'Who Wrote it?' The latter, completed by C. G. Wheeler, was published in 1881. He edited Hole's 'Brief Biographical Dictionary' (1866); a 'Dickens Dictionary' (1873); and also 'Familiar Allusions' (1882).

Wheeler, William Almon, American legislator: b. Malone, N. Y., 30 June 1819; d. there 4 June 1887. He was educated at the University of Vermont, was admitted to the bar in 1845, and engaged in practice in Franklin County, N. Y. He was United States district-attorney of that county in 1847-9 and in the last named year was elected as a Whig to the State assembly, but in 1856 he joined the ranks of the then newly organized Republican party. From 1851 to 1866 he was connected with a bank in Malone, but was a member of the New York assembly in 1858-9, serving as president *pro tempore*. In 1860 he was elected to Congress for one term, and in 1867 was president of the State constitutional convention. He was re-elected to Congress in 1869 and served until 1877, taking a prominent part in the adjustment of Southern affairs under the Reconstruction act and settling the political difficulties in Louisiana by the well known "Wheeler Compromise." He was vice-president of the United States under Hayes in 1877-81 and thereafter lived in retirement.

Wheeler, Post, American author: b. Owego, N. Y., 6 Oct. 1860. He was graduated from Princeton in 1891, and subsequently spent much time with the Tlukudh Indians in the Arctic region. He has published 'The Writer' (1893); 'Reflections of a Bachelor' (1897); 'Love-in-a-Mist' (1901).

WHEELING—WHELOCK

Wheeling, hwē'ling, W. Va., city, county-seat of Ohio County; on the Ohio River, and on the Pittsburg, C., C. & St. L., the Wheeling & L. E., the Pennsylvania, the Cleveland, L. & W., and the Baltimore & O. R.R.'s; about 60 miles southwest of Pittsburg, Pa. It is the largest city in West Virginia. The land area is 2,050 acres. Part of the city is on Zane's island, which is over a mile long and contains 400 acres. A suspension bridge, over 1,000 feet long, and a steel bridge, over which are electric-car lines, connect Zane's island, or the seventh ward, with the main part of the city. The city has steamer connections with all the Ohio and Mississippi ports. The main streets run parallel with the river, and the cross streets extend back from the river to the hills in the eastern part. Among the features of interest are the courthouse, city-hall, government building, the site of old Fort Henry, the Krugar Monument, the parks, and the squares.

Business Interests.—The excellent transportation facilities of the city make it the commercial centre of the northwest part of the State, and also of parts of Pennsylvania and Ohio. The coal fields of the vicinity and the abundance of raw material near by make it an important manufacturing centre. In 1900 (government census) Wheeling had 406 manufacturing establishments, which were capitalized for \$13,224,577 and in which were employed 7,219 persons, who received, annually, wages to the amount of \$3,096,730. The raw material used cost each year \$9,076,978 and the finished products were valued at \$16,747,544. From 1890 to 1900 there had been a slight decrease in the number of manufacturing, but there had been an increase of 18.2 per cent in the number of wage-earners, and of 28.2 per cent in the value of the products. Some of the coal used in the factories is mined within the city limits. The chief manufactures are iron and steel products, pottery, glass, tobacco products, leather, lumber products, canned goods, beer, wagons, and carriages.

Churches, Schools and Charities.—There are about 45 churches. The schools are Linsley Institute, Mount de Chantal Academy (R. C.), Saint Joseph's Academy (R. C.), Wheeling Female Academy, Wheeling Business College, a high school, opened in 1897, public and parish elementary schools, several private schools, a public library which contains about 18,000 volumes, and school libraries. The city has Has-kin's Hospital, North Wheeling Hospital, Saint Alphonsus Orphanage, a day nursery, and homes for the aged and friendless.

Banks and Finances.—There are 15 banks, two of which are national. The combined capital, in 1903, was nearly \$2,000,000, and the deposits, nearly \$10,000,000. The city spends annually for maintenance and operation about \$440,000. The chief items of expenses are for schools, \$93,500; for gas plant, \$80,000; water-works, \$50,000; fire department, \$41,500; police department, \$36,000; interest on debt, \$25,000.

Government.—The government is vested in a mayor, who holds office two years, and a city council. The board of education is chosen by popular vote; the board of public works, the water board, and the municipal light board are chosen by the council. Other administrative officials are appointed by the mayor, usually subject to the approval of the council.

History.—Wheeling was the first town founded on the Ohio River. The first settlement was made in 1769 by Ebenezer Zane. In 1774 a stockade fort—Fort Henry, named in honor of Patrick Henry—was built here as a defense against the Indians. On 1 Sept. 1777, this fort was attacked by an Indian force, 300 in number, who were repulsed, but 15 of the settlers were killed. In 1781 another attack was made. On 11 Sept. 1782 the fort was again attacked, this time by a force of 40 British soldiers and 260 Indians. They continued the attack for two days, but were forced to abandon their project, so well was the defense maintained by Colonel Zane and his small garrison. In 1793 the town was laid out by Colonel Zane, and in 1806 it was incorporated. In 1836 it was chartered as a city. In 1861 it was made the capital of the "restored government of Virginia" by the people of Virginia who were opposed to secession. The Constitutional Convention of West Virginia met here in 1861-2, and it was the meeting place of the convention which, in 1863, formed the State of West Virginia. It was the capital of the State in 1863-70 and again in 1875-85.

Population.—(1880) 30,757; (1890) 34,522; (1900) 38,878; (1903, est. Gov. Report) 40,186.

Wheelock, hwē'lōk, **Eleazar**, American clergyman: b. Windham, Conn., 22 April 1711; d. Hanover, N. H., 24 April 1779. He was graduated at Yale in 1733, and in 1735 was ordained pastor of the 2d Congregational society in Lebanon, near Columbia, Conn., where he remained until 1770. In 1754 he opened a missionary school for Indians, known from Joshua Moor, who gave for its use a building and two acres of ground, as Moor's Indian Charity School. This he removed in August 1770 to Dresden (now Hanover), N. H., founding Dartmouth College, to which a charter had been granted in 1769. Among Wheelock's Indian pupils were Sampson Occum (q.v.) and Joseph Brant (q.v.). (See also DARTMOUTH COLLEGE.) Consult the 'Memoir' by McClure and Parish (1811).

Wheelock, **John**, American educator: b. Lebanon, Conn., 28 Jan. 1754; d. Hanover, N. H., 4 April 1817. He was son of Eleazar Wheelock (q.v.). He entered Yale in 1767, but became a member of the new Dartmouth College at Hanover, N. H., and was graduated with the first class in 1771. He was a tutor there 1772-4, in 1775 was elected a member of the provincial assembly, in 1777 was appointed a major in the New York forces, and soon after lieutenant-colonel in the Continental army. In 1778 he was selected by General John Stark to lead an expedition against the Indians, and within a year was called to a position on General Gates' staff, in which he remained till the death of his father, when he was elected his successor as president of the college (1779). In 1783 the trustees sent him to Europe to secure books and money for the institution. On his return the vessel in which he had embarked was wrecked off Cape Cod, and the money, books, and papers lost. He continued in the presidency 36 years, till, in consequence of some ecclesiastical controversy among the trustees, he was removed in 1815. In 1817 a new board of trustees restored him to office, but his death occurred a few weeks after. He bequeathed half his large estate to Princeton Theological

WHEELWORK—WHEWELL

Seminary. He published 'Essay on the Beauties and Excellencies of Painting, Music, and Poetry' (1774) 'Sketches of the History of Dartmouth College' (1816); etc.

Wheelwork. See CLOCKWORK.

Wheelwright, hwēl'rit, John, American Puritan clergyman: b. Lincolnshire, England, about 1592; d. Salisbury, N. H., 15 Nov. 1679. He was a graduate of Cambridge, and vicar of Bilsby, near Alford, Lincolnshire; but in 1636, being driven from his church by Archbishop Laud, he emigrated to Boston, Mass., where the same year he was chosen pastor of a branch of the Boston church at Mount Wollaston, in what is now Quincy. The celebrated Anne Hutchinson (q.v.) was his sister-in-law, and he partook of her views. Differences of opinion led to personal animosities between him and John Wilson, the pastor of the Boston church; and the general court appointed a fast in January 1637, partly to heal these dissensions. On this occasion Wheelwright preached in Boston, and as his enemies asserted, denounced the ministers and magistrates. The general court pronounced him guilty of sedition and contempt, for which in November 1637 he was banished from the colony. In 1638 he formed a settlement on the banks of the Piscataqua, which he called Exeter. After a residence of five years here, the town was declared to be within the limits of Massachusetts, and he removed with a part of his church to Wells in the district of Maine. In 1644 his sentence of banishment was revoked, in consequence of some acknowledgments on his part, and he returned to that colony in 1646, and settled in Hampton. In 1654 he published his 'Vindication.' About 1657 he went to England, where Cromwell, who had been his college classmate, received him cordially; but he returned in 1660, and in 1662 settled as pastor in Salisbury, N. H. His 'Writings,' edited, with a memoir, by C. H. Bell, were published by the Prince Society in 1876.

Wheelwright, John Tyler, American author: b. Roxbury, Mass., 26 Feb. 1856. He was graduated at Harvard College in 1876, studied law and was admitted to the Suffolk bar in 1879. He was acting park commissioner of Boston in 1897. He has published 'Rollo's Journey to Cambridge' (1880, with F. J. Stimson); 'A Child of the Century' (1887); 'A Bad Penny' (1895); etc.

Whelan, hwē'lan, Richard Vincent, American Roman Catholic prelate: b. Baltimore, Md., 28 Jan. 1809; d. there 7 July 1874. He was educated at Mount Saint Mary's College, Emmitsburg, Md., and at the Seminary of Saint Sulpice, Paris, where he was graduated in 1831. He was ordained to the priesthood in 1832, returned to the United States, and in 1832-5 was a professor at Mount Saint Mary's. He was engaged in missionary work at Harper's Ferry and other towns in Virginia and Maryland in 1835-40, and in the latter year was consecrated bishop of Richmond. He built a theological seminary near Richmond, founded schools and academies, built a cathedral at Wheeling, and in various ways greatly improved the condition of his diocese. When the diocese was divided in 1850 he became bishop of Wheeling. The Wheeling diocese then contained but two churches and two priests, with no supplementary institutions of any kind. At his death it

possessed 48 churches, 40 stations for religious services, 29 priests, six academies, four convents, a hospital, an orphan asylum, and a college. He was present at the Vatican Council of 1869-70 and opposed the definition of the dogma of papal infallibility, considering the time inopportune for its definition, but upon its declaration he submitted promptly to the decision of the council.

Whelk, a gastropod mollusk of the genus *Buccinum* and order *Ctenobranchiata*. The large or common whelk (*B. undatum*) is of common occurrence on both sides of the North Atlantic, and is distinguished by the shell having its canal notched, and the mouth or aperture of large size. The whorls of the shell, which has a thick horny epidermis, are few and rounded. In England these animals are largely used for food and bait, and are caught in "creels" baited with garbage, but in America they are not eaten. The eggs are contained in egg-cases, bundles of which are common on the sea-coasts; each capsule contains several eggs, some of which develop and devour the others. The red whelk, or "roaring buckie" of the Scotch (*Fusus antiquus*), belongs to the family *Fusida* (q.v.). The tulip whelk (*Fasciolaria tulipa*) is very richly colored and inhabits the tropical seas. The purple whelk (*Purpura lapillus*) is so named from its affording a part of the dye which made Tyre of old so famous.

Wherry, hwēr'ī, William Macky, American soldier: b. Saint Louis, Mo., 13 Sept. 1836. He was educated at the University of Missouri and studied law; served through the Civil War; and was present at the battles of Wilson's Creek, Dallas, Kencasaw Mountain, Atlanta, Jonesboro, Nashville, and at the surrender of Gen. J. E. Johnston. He was brevetted brigadier-general of volunteers in 1865, mustered out of the volunteer service in 1866, and appointed captain in the regular army and subsequently served on frontier duty. In the war with Spain in 1898 he took part in the battle of San Juan Hill, and in the capture of Santiago. He was promoted brigadier-general, U. S. A., 7 Jan. 1899, and was retired the same month. He has published 'Battles and Leaders of the Civil War' (1888-9).

Wherry, a light, shallow boat, for plying on rivers; also a light, half-decked fishing vessel, used in different parts of Great Britain and Ireland.

Whetstone, any stone used for sharpening tools. Sandstones and fine mica schists form the coarser kinds. Silicious clay rocks (lutites) and particularly the fine compact rocks made of quartz-mud (silicilutites), such as the Arkansas stone or novaculite, form the more desirable varieties for oil-stones and delicate hones. See SEDIMENTARY ROCKS; SCHISTS.

Whewell, hu'ēl, William, English scholar: b. Lancaster 24 May 1794; d. Cambridge 6 March 1866. He was graduated from Trinity College, Cambridge, in 1816, and in due course became fellow and tutor of his college. He labored with Herschel, Babbage, and Peacock to raise the standard of mathematics in the university, and wrote text-books which were justly celebrated. From 1828 till 1832 he was professor of mineralogy, and in 1838 was elected

WHICHCOTE—WHIN

to the Knightbridge chair of moral philosophy, which he held till 1855. In 1841 he became master of Trinity and in this position labored earnestly and successfully to obtain for the natural and moral sciences a better recognized position among the studies of the university. He became fellow of the Royal Society in 1820, and was one of the first members of the British Association, of which he was president in 1841. Whewell was a strong, healthy, clear-headed man, possessed of a vigorous and capacious intellect, and endowed with extraordinary powers of acquiring and retaining knowledge. The extent and variety of his attainments were something wonderful. Yet there was nothing superficial about his learning, notwithstanding the well-known *mot* of Sydney Smith, that "science was his forte and omniscience his foible." Besides other gifts, he built at his own expense, and presented to his college, a *hostel*, or collection of chambers for undergraduates. His principal writings include: 'The Bridgewater treatise 'Astronomy and General Physics, considered with reference to Natural Theology' (1833); 'History of the Inductive Sciences' (1837); 'Philosophy of the Inductive Sciences' (1840); 'Novum Organum Renovatum'; 'Indications of the Creator'; 'History of Scientific Ideas'; 'Elements of Morality, including Polity'; 'Lectures on Systematic Morality'; 'Architectural Notes on German Churches'; 'On Liberal Education in General'; 'Lectures on the History of Moral Philosophy in England'; 'Philosophy of Discovery'; 'History of Moral Philosophy'; 'Platonic Dialogues for English Readers.' He was the author of the well-known anonymous essay, 'The Plurality of Worlds.' Consult: Todhunter, 'Whewell: an Account of His Writings' (1876); 'Life' by Mrs. Stair Douglas (1881); Clark, 'Old Friends at Cambridge and Elsewhere' (1900).

Whichcote, hwich'köt, **Benjamin**, English Anglican clergyman: b. Stoke, Shropshire, 11 March 1610; d. Cambridge May 1683. He was educated at Emmanuel College, Cambridge, took orders in the English Church in 1636, held the living of North Cadbury, Somerset in 1643, and the next year was appointed provost of King's College, Cambridge. He was a leader of the latitudinarian school of English divines; a famous preacher, and one of the Cambridge Platonists. His works, published posthumously, include: 'Observations and Aphorisms' (1688); 'Moral and Religious Aphorisms' (1703); 'Sermons' (1698-1707); etc. Consult: Tulloch, 'Rational Theology,' Vol. II. (1872); Westcott, 'Essays in the History of Religious Thought' (1891); Mullinger, 'History of the University of Cambridge' (1892).

Whigs, a word of British origin, used for many years to designate an American political party. It had previously been used in America in colonial and revolutionary times to indicate those who were opposed to the attempts of the British Crown to deprive the Americans of their political and commercial rights. It disappeared with the close of the Revolution, and did not appear again until the National Republicans, successors to the Federalists (q.v.), adopted the name of Whigs. Those Whigs who considered the slavery question settled by the compromise of 1850 were called in Massachusetts "Cotton Whigs," and in New York "Silver Grays." The

Whigs continued to exist as one of the two great parties until the election of 1852, which was followed by a division on the slavery issue, the anti-slavery Whigs joining the Republican party, and the others making common cause with the Democracy.

The term was prominent in British political history for nearly two centuries to designate the political party which advocates such changes in the constitution as tend in the direction of democracy. Defoe thus accounts for the origin of the name: "The use of it began then when the western men (the peasantry of the West Lowlands of Scotland), called Cameronians, took arms frequently for their religion. Whig is a word used in those parts for a liquor (*whig*, Scotch for *whisky*), which the men used to drink . . . and so became common to the people who drank it. It afterward became a denomination of the poor harassed people of that part of the country, who, being unmercifully persecuted by the government, against all law and justice, thought they had a civil right to their religious liberties, and therefore resisted the power of the prince (Charles II.)." Monmouth was sent to quell the insurrection, and "at his return he found himself ill-treated for having used the rebels too mercifully; and Lauderdale told Charles, with an oath, that the duke had been so civil to the Whigs because he was a Whig himself in his heart. This made it a court word, and in a little time the friends and followers of the duke began to be called Whigs."

A different origin is, however, assigned to the term. Sir James Balfour, in writing of an outbreak which occurred in 1648, in his own day, calls the enthusiasts "whigamores," and Burnet, who was then five years old, offers the following explanation: "The southwest counties of Scotland have seldom corn enough to serve them throughout the year, and the northern parts producing more than they need, those in the west come in the summer to buy at Leith the stores that come from the north; and from a word, whiggam, used in driving their horses, all that drove were called the whigamors, and shorter, the whiggs. After the news come of Duke Hamilton's defeat (in 1648), the ministers animated their people to rise and march to Edinburgh; and they came up, marching at the head of their parishes, with an unheard-of fury, preaching and praying as they came. . . . This was called the whiggamors' inroad, and ever after that all that opposed the court came in derision to be called whiggs; and from Scotland the word passed to England." The Whigs brought about the revolution of 1688-9, and established the Protestant succession; they were chiefly instrumental in obtaining the abolition of the slave-trade and slavery, the repeal of the Test and Corporation Acts, Catholic emancipation, parliamentary and municipal reform, the repeal of the corn-laws, and similar measures. The term Liberals is now generally applied to the representatives of this party; the extreme section of the party, who agitate for sweeping innovations, usually have a more or less close connection with the Whigs, and have adopted the name of Radicals. See **POLITICAL PARTIES**.

Whin. See **FURZE**.

WHIN — WHIPPLE

Whin, **Whinstone**, a mining term for intruded igneous or basaltic rocks generally of a firm texture and resistant character. The great Whin Sill of Northumberland is a typical example.

Whin-chat, an European warbler (*Pratincola rubetra*), allied to the stonechat, and is named from its frequenting the neighborhood of whin and furze bushes. It possesses a long white streak, passing across the sides of the head, which, as well as all the upper parts of the body, is colored brown. The lower parts are yellowish. Its song is very sweet, and it has been known to imitate the song of other birds.

Whip or **Coach-whip Snake**, a light brown harmless snake (*Zameus flagelliformis*) with whitish tail, closely related to the blacksnake. It is found in the southern United States and Mexico, and is especially abundant in Texas. Its name is given it on account of its general appearance; and the more ignorant Indians and negroes believe it will whip or lash its adversary with its tail. It runs with the utmost swiftness, and has the general habits of a blacksnake (q.v.). A group of very slender poisonous African and Asiatic tree-snakes, the *Dipsadina*, are called whip-snakes in some books. They are elapine and poisonous, and conceal themselves aided by their leaf-green color, in bushes where they dart upon birds, lizards, insects, etc., unsuspecting of their presence.

Whipping Post, a punishment inflicted by the law of England, and also in the State of Delaware, chiefly for minor offences. The criminal law in England enumerates several offences for which the punishment may be inflicted on males under 16. A subsequent act enacts that when the offender is under 14 the number of strokes is not to exceed 12. In Scotland no person above 16 is to be whipped for theft or crime committed against person or property. In Delaware robbery, theft, and other crimes are punished by whipping. See also **FLAGELLATION**.

Whipple, hwīp'l, **Abraham**, American naval officer: b. Providence, R. I., 1733; d. near Marietta, Ohio, 29 May 1819. In the French and Indian war he commanded the privateer Gamecock and on one cruise alone captured 23 prizes. He was in charge of the expedition which on 8-9 June 1772 destroyed the British armed schooner Gaspee, commanded successively the Columbus, the schooner Providence, and the frigate Providence, and from 1775-9 with the schooner Providence took more prizes and destroyed more vessels than any other commander in the colonial service. With the frigate Providence he evaded British surveillance and succeeded in getting to sea with important despatches for France, and in 1779 performed the daring exploit of capturing 10 vessels from a merchant fleet of nearly 150 sail, eight of which reached Boston safely, and brought \$1,000,000. He commanded the naval forces at Charleston, S. C., in 1780, but was captured and held a prisoner until the close of the war. He commanded the vessel which in 1784 unfurled the first American flag on the river Thames.

Whipple, **Edwin Percy**, American author and critic: b. Gloucester, Mass., 8 March 1819; d. Boston 16 June 1886. After a secondary education, he began writing for newspapers, in

1837 became a clerk in a Boston brokerage office, and from 1837 to 1860 was superintendent of the reading-room of the Merchants' Exchange. In 1843 he first attracted attention by a critical panegyric on Macaulay in the Boston 'Miscellany,' and in October of that year entered upon his successful career as a lecturer, chiefly on literary topics. He contributed much to reviews and journals, publishing in 1848-9 two volumes of 'Essays and Reviews,' including discussions of 'English Poets of the 19th Century,' 'Byron,' 'Rufus Choate,' and 'Henry Fielding.' In 1872-3 he was literary editor of the Boston *Globe*, a newly-established daily. The greater part of his work is composed of essays on literature and authors, though he treated of other subjects with an almost equal discrimination. His 'Literature of the Age of Elizabeth' (1876) probably shows him to best advantage, though his estimates of the moderns are also painstaking and for the most part just. His characterizations were penetrative, and at times very effectively expressed. He lacked, however, to a large extent, originality and power, and Whittier's declaration that "with the possible exception of Lowell and Matthew Arnold, he was the ablest critical essayist of his time" cannot now be accepted. Among his further publications are: 'Literature and Life' (1849), a small volume of lectures; 'Character and Characteristic Men' (1866); 'Success and its Conditions' (1871). Three books appeared posthumously, 'Recollections of Eminent Men, with Other Papers' (1887), with an introduction by C. A. Bartol; 'American Literature and Other Papers' (1887), with a brief introduction by Whittier, and containing the centennial review of American literature written in 1876 for 'Harper's Magazine'; and 'Outlooks on Society, Literature and Politics' (1888). Consult papers by T. W. Higginson in the 'Atlantic,' Vol. lvi. 345, and by T. W. Hunt in the 'Bibliotheca Sacra,' l. 30.

Whipple, **Henry Benjamin**, American Protestant Episcopal bishop: b. Adams, Jefferson County, N. Y., 15 Feb. 1822; d. Faribault, Minn., 16 Sept. 1901. Ill health prevented his entering college, for which he had prepared, and he engaged in business for several years. In 1847 he began a theological course privately, took priest's orders in the Episcopal Church in 1850 and was rector of Zion Church, Rome, N. Y., 1850-7 and of the Church of the Holy Communion, Chicago, 1857-9. In October 1859 he was consecrated first bishop of Minnesota. He very soon afterward organized the Seabury Mission at Faribault, out of which have since been developed the cathedral of Our Merciful Saviour, Seabury Divinity School, the Shattuck School for boys, and Saint Mary's Hall, a school for girls. Bishop Whipple was widely known as "the apostle to the Indians" on account of his labors among them both for their material as well as spiritual welfare. By the Indians themselves he was called "Straight Tongue." He thoroughly understood the Indian character and at the time of the Sioux massacre in 1862 insisted that the trouble came directly from the false dealing of the whites with the Indians. In 1876 he secured the Sioux treaty, opening up the best portions of Dakota to white settlement, and his advice in regard to Indian affairs was sought by every President from Lincoln to McKinley. In his 'Lights and Shadows

WHIPPLE—WHISKY

of a Long Episcopate' (1899) the character of the Indian problem will be found very fully treated. Bishop Whipple traveled extensively and was well known and highly regarded in England, while in his own country he was beloved and respected by men of every creed.

Whipple, Squire, American civil engineer: b. Hardwick, Mass., 24 March 1804; d. Albany, N. Y., 15 March 1888. He was graduated from Union College in 1830 and engaged in canal and railway surveying. He patented in 1840 an iron bridge truss of the bowstring type, several of which were built over the Erie Canal. After 1852 he built several bridges known as the "Whipple trapezoidal type," and in 1872 took out a patent for a lift drawbridge, one of which was built over the Erie Canal at Utica. He wrote: 'The Way to Happiness' (1847); 'Treatise on Bridge Building' (1847); and 'The Doctrine of Central Forces' (1866).

Whipple, William, American soldier and politician: b. Kittery, Me., 14 Jan. 1730; d. Portsmouth 28 Nov. 1785. Before 1751 he was captain of a merchantman trading with the West Indies and making voyages to Africa for slaves. But in 1759 he set up as a merchant at Portsmouth, and in 1775 was chosen a delegate to the New Hampshire provincial congress. He was also made a member of the provincial council of safety. In January 1776 he was elected to the Continental Congress, continuing to hold his seat until September 1779, and signing the Declaration of Independence. As brigadier-general of New Hampshire troops, he commanded a brigade in the operations against Burgoyne in 1777, and assisted in negotiating the terms of the surrender of the British general. Commanding the New Hampshire forces, he co-operated with Sullivan in the campaign against the British in Rhode Island in 1778. From 1782 to 1784 he was superintendent of finance for New Hampshire, and from 1782 until his death a judge of the superior court. He was president of the commission for the adjustment of the dispute between Connecticut and Pennsylvania regarding the Wyoming Valley region.

Whip'poorwill, a North American night-jar (*Antrostomus vociferus*). In this genus the rictal bristles are greatly developed and reach far beyond the tip of the small, weak bill, and sometimes they are fringed. The nostrils are not tubular as in *Nyctidromus*. The whip-poorwill is 10 inches long with a spread of wings of about 18 inches, the rictal bristles are simple, the tail long and rounded, and the soft lax plumage closely and delicately mottled with gray, black, white, and yellowish brown, the female with the tips of the outer tail-feathers tawny, the same parts in the male white. These birds inhabit the United States and British provinces east of the plains, and breed, chiefly northward, throughout most of this area. Being migratory they reach the Middle and New England States in May. The whip-poorwill is a strictly nocturnal bird, but usually becomes quiet by midnight except on moonlight nights when they continue active till dawn; but at all times they are most vociferous during the early evening. The song is a clear, energetic whistle, aptly syllabified in the name, strongly accented on the last syllable, and is repeated many times; then, after a short pause, begins anew. They fly noiselessly in pursuit of flying in-

sects, skimming low over stone walls and bushes or even alight on the ground to pick up a beetle or other insect. Large moths, night-flying beetles, and insects frequenting forest borders are their chief food. As they pass close to a person at night they are heard to utter a low murmuring sound. Unlike the great majority of birds they always perch along and not across a bough, a peculiarity which they share with other weak-footed birds. Whip-poorwills do not fly abroad during cloudy days like the night hawk, and as a consequence their appearance is unknown to many persons to whom the song is quite familiar. No nest is made and the two elliptical creamy white eggs marked with brown and lavender are laid in a depression on the bare ground or a log. When danger threatens, the old birds often carry the eggs or young in their mouths to a place of safety. A much larger species of similar colors and habits, but more southern in its range, is the chuck-will's-widow (*A. carolinensis*) (q.v.). In this species the rictal bristles are provided with lateral filaments.

Whiptail Scorpion. See SCORPION.

Whirligig Beetle. See WATER-BEETLE.

Whirlpool, a circular eddy or current in a stream or the sea, produced by the configuration of the channel, by meeting currents, by winds meeting tides, etc. There are some very celebrated whirlpools, such as Charybdis, in the strait between Sicily and Italy; and the Malström, off the coast of Norway. When agitated by tides or winds they sometimes become dangerous to navigators. These are not, however, whirlpools in the strict sense, which are indeed very rare, but merely superficial commotions created by winds meeting tides, and in calm weather are free from all danger.

Whirlwind. See CYCLONE; SIMOON; WATER-SPOUT.

Whisky, the name applied to a well known liquor distilled from barley, wheat, oats, and other grains; potatoes, beet, and other roots. It is much used in England by rectifiers, who convert it into British gin, and in its simple form is in great repute both in Scotland and Ireland. It may, indeed, be considered the national beverage of both these countries and of the United States. Whisky from malt alone is made in the Scotch distilleries as follows: The malt is bruised upon cylinders, and the quantity intended to be mashed is put into the mash pan, water at a temperature of about 170° F. being then added. After two or three hours' agitation the whole is left to repose for an hour and a half, and then the worts are drawn off to about one third of the water employed. About two thirds of the first quantity of water of a somewhat higher temperature is put into the pan, and the agitation is renewed for about half an hour. After a second period of repose these second worts are drawn off. Both infusions are now cooled down as quickly as possible to the temperature of 80° or 70° to prevent souring; the wort is cooled down by being exposed in shallow coolers to currents of air, or by being passed through serpentine tubes surrounded with cold water. More water may be let into the pan, and a third wort drawn off, which may be mixed with the other worts, or used instead of water for the first infusion of malt. The quantity of saccharine matter con-

THE LATE BISHOP HENRY BENJAMIN WHIPPLE.

WHISKY

verted into alcohol depends upon the proportion of ferment or yeast introduced into the worts; if too little be used, a portion of the sugar will remain undecomposed; if too much, the spirits will have an unpleasant taste. Generally the worts are let down at the specific gravity of 1.050 or 1.060, and at a temperature of 60° to 50°. For every 100 gallons a gallon of good porter yeast is added and thoroughly incorporated by agitation. An hour after the addition of the yeast fermentation begins to show itself by a ring of froth round the edges of the vat, and in about five hours frothy bubbles cover its whole surface. Large vats generally afford a better result than small ones, owing to the equality of the fermenting process. It is considered good work when the specific gravity comes down to that of water and superior work when it falls to 0.995. In about 48 to 60 hours the wash begins to get clear and comparatively tranquil, and is then ready for distillation. In its simplest form the still consists of a copper boiler into which the wash is poured. This vessel is furnished with a close head terminating in a bent tube which passes in a spiral form through a vessel filled with cold water. (See DISTILLATION.) On the application of heat to the still the spirit begins to rise in vapor at 175°, along with more or less steam. These vapors are condensed in passing through the spiral tube, and trickle in fluid form into a receiver. The product of this first distillation is called low wines. This is again distilled at a lower temperature, which gets rid of part of the water and of the fetid oils that had come over with the alcohol. Great purity and strength can only be obtained by repeated distillation.

In the United States, Kentucky whiskies, or those represented to be such, constitute the majority of those consumed for drinking purposes, either medicinal or otherwise. At the head of the various processes of distillation, for excellence of quality of the spirit produced thereby, stands that known in Kentucky as "sour mash, fire copper," which is the method that originally established the high reputation of Kentucky whisky; those since employed, while giving a larger yield of spirit to the bushel of grain, procure it at the expense of the quality and flavor thereof. In this process the corn and rye meals are scalded or mashed with hot spent beer, which is the liquid residue of the previous distillation. The mash is then allowed to cool to the proper temperature, when malt is added, and the mash, diluted with a sufficient quantity of water, is left to ferment the time established by law. The diluted mash when fermented is called beer. The beer is distilled in three different ways. In the very smallest distilleries, it is sometimes boiled in copper stills, over wood fires; the vapor, passing through a copper coil or worm, immersed in cold water, is condensed and delivered into a receiver. The condensed liquid is called low wines, or singlings. Singlings contain only a small amount of spirit. This manner of boiling the beer is seldom used, as the large quantity of grain contained in the beer makes it apt to cake in the still; and, becoming scorched, it gives the whisky a strong, smoky flavor, a very little of which, however, is not considered objectionable. The singlings are doubled or again distilled in small copper stills, or doublers, over wood fires, and the vapor again condensed in a

copper worm, whence it is delivered into the whisky cistern. The usual way of distilling sour mash whisky is to boil the beer in a wooden still by admitting steam, the vapor being condensed into singlings; the singlings are doubled as above. In the third way, the beer is boiled in a copper still, by steam confined in a copper pipe, placed inside of the still. The singlings are doubled in small copper stills, over wood fires, in the same manner described. This latter way is considered a great improvement, as it avoids both the scorching of the grain in distilling the beer and the admission of live steam, while it preserves all the characteristics so highly prized in "sour-mash, fire copper" whiskies. The yield by the sour-mash process is from two to three gallons to the bushel of grain.

Most whisky is made by the process known as "steam." In this the corn and rye meals and malt are mixed with water in the mash-tub, where they are scalded with direct or live steam, introduced by means of a perforated pipe at the bottom of the tub. When fully scalded, the mash is cooled down and run into the fermenting tubs. Fresh yeast is used in fermenting, which gives the name of "sweet mash." The still is made of wood and divided into two or three compartments. When the still is charged, a certain amount of beer is placed in each compartment, live steam is admitted into the lower, which boils the beer, and the vapor from it ascends through a curved pipe into the compartment above, where its continued reception boils the charge therein contained; the vapor from this again ascends into the next compartment above, where the same process is repeated. The vapor then passes through a pipe into a wooden doubler, where it boils the low wines; and the vapor arising thence passes into a copper worm, where it is condensed and then run into the whisky cistern. Only one worm is used and one condensation made. Highwines, as well as whisky, are manufactured by this process. The yield is from three and a half to four and a half gallons. In making whisky by the "steam copper" process, the mash is made and fermented and the beer boiled, in the same manner as for the "steam" process. The same wooden still is used; but, instead of the vapor from the upper compartment passing directly into a wooden doubler, it is run through a worm and condensed into singlings, which are doubled in a copper still by live steam, or by steam confined in a jacket around the still, or sometimes by fire underneath.

In locating a distillery a full supply of clear, bright water, that contains the proper chemical qualities, is the first consideration. It is well known to both chemists and practical distillers that water containing a large quantity of sulphate of lime, earthy carbonates, and no organic matter, is best adapted to distilling. The lime and carbonates being dissolved in the acid generated during the fermentation of the mash, mostly pass off in the form of carbonic acid gas, and leave the water soft and best suited for extracting the active properties of the malt and grain. Great care has to be taken in the selection of the grain to have it well developed and sound. Musty or unsound grain is fatal to the production of fine whisky, and its defects become more prominent as the whisky increases in age. Those distillers most careful to manu-

WHISKY FRAUDS—WHIST

facture only fine goods use the grain that is grown in their own section of the country, in order to have both the grain and water spring from the same kind of soil. Successful fermentation requires of the distiller not only constant attention, but also extensive knowledge both of the principles of chemistry and of practical results. It is exceedingly injurious to allow the fermentation to be prematurely concluded or to proceed too long. As a general rule, the slower the fermentation and lower the heat at which the distillation is carried on, the finer and purer will be the spirit. The mash being made and fermented, and the beer distilled by whatever process, the whisky is collected in the cistern, and thence run into barrels, under the control of the United States inspector, and in the custody of the United States storekeeper, who has also charge of it while in the bonded warehouse, till the tax is paid. It may be well to mention that from the weighing of the grain when put in the mash tub till the final tax is paid on the whisky in the bonded warehouse, every part of the process of manufacture, as well as manufactured whisky, is under the entire control and supervision of the United States government officials. Barrels, and the cooperage thereof, require much attention, and must be made of well-seasoned oak. For highwines they are not charred, but for whisky they should be well charred, as the char has some peculiar chemical effect on the character and ripening of the whisky that is very desirable.

In 1902 grain to the amount of 27,320,857 bushels was consumed in the manufacture of whisky, the product of which for the year 1902 in the United States amounted to 123,847,304 gallons.

Whisky Frauds, The, in American civil history, a national internal revenue scandal, which reached its climax in 1874 through the efforts of Secretary of the Treasury D. H. Bristow. Statistics showed that for some years prior to 1874 the United States had, in St. Louis alone, lost at least \$1,200,000 of revenue which it should have received from whisky, yet special agents of the Treasury set to work from time to time had failed to do more than cause an occasional flurry among the thieves. The Whisky Ring was organized in St. Louis when the Liberal Republicans there achieved their first success. It occurred to certain politicians to have the revenue officers raise a campaign fund among the distillers. This idea the officers modified later, raising money in the same way for themselves, and in return conniving at the grossest thievery. As it became necessary to hide the frauds, newspapers and higher officials were hushed, till the ring assumed national dimensions. Its headquarters were at St. Louis, but it had branches at Milwaukee, Chicago, Peoria, Cincinnati, and New Orleans, and an agent at Washington. A huge corruption fund was distributed among gaugers, storekeepers, collectors, and other officials, according to a fixed schedule of prices. As a result of the investigation by Secretary Bristow arrests were made in nearly every leading city. Indictments were found against 152 liquor men and other private parties, and against 86 government officials, notably the chief clerk in the Treasury Department, and Gen. Grant's private secretary, Gen. O. E. Babcock.

Whisky Insurrection, a popular name given to a local outbreak in opposition to the excise laws passed by Congress 3 March 1791. General objections were urged against the measure and in western Pennsylvania the inhabitants considered the tax an unfair discrimination against their particular region and raised an insurrection. It became necessary for President Washington to call out an army of 15,000 militia to subdue the rebels, who dispersed without bloodshed.

Whispering Gallery, a gallery or dome of an elliptical or circular form, in which faint sounds conveyed around the interior wall may be readily heard, while the same are inaudible elsewhere in the interior. Thus, in an elliptical chamber, if a person standing in one of the foci speak in a whisper, he will be heard distinctly by a person standing in the other focus, though the same sound would not be audible at the same distance under any other circumstances, or at any other place in the chamber. There is a whispering gallery in the Capitol at Washington, one at Saint Paul's Cathedral, London, and another at Gloucester Cathedral, England.

Whist, a well-known game at cards, first clearly described by Edmond Hoyle (q.v.) in his 'Short Treatise on the Game of Whist' (1743). The game is played with the full pack of 52 cards by four persons, two being partners against the other two, each player receiving 13 cards dealt out one by one in rotation. The last card dealt is turned face up, and is called the trump card; it gives a special power to the suit to which it belongs. The cards rank as follows: ace (highest), king, queen, knave, and the others according to their number of pips. Play is commenced by the person on the left hand of the dealer laying down a card face up on the table, the other players following in succession with cards of the same suit if they have them. When all have played the player who has the highest card takes the four cards laid down, which constitute a trick. The winner of the trick then leads, as the first of a new trick, the winner of which becomes the leader, and so on. When a player cannot play a card of the same suit, he may play one of the trump suit, and take the trick, or lay one of a different suit, which gives him no chance of winning the trick. When the hand is played out the score is taken as follows: the partners who conjointly gain the majority of tricks score one point for every trick taken above six. The ace, king, queen, and knave of the trump suit are called honors, and count one each for the side which holds them; if one side hold three honors, they count two by honors, as the opposite side can have but one; if one side hold all the honors, four by honors is counted; should the honors be equally divided neither side counts, the honors being then said to cancel each other. In long whist, an obsolescent form of the game, 10 of these points made a game. In short whist, the game now generally played, the number has been reduced to five, and in this form it is common to count by tricks alone. A rubber consists of a series of three games, and is won by the side that secures two of them. Should one party gain two games in succession, the third of the rubber is not played. In duplicate whist the hands played are preserved and replayed by the opposing side.

WHISTLE-WOOD — WHISTLER

Whistle-wood, a North American maple-tree (*Acer pennsylvanicum*). It is a small tree, or sometimes only a shrub, common in the mountainous districts of the eastern United States and Canada. Generally it is found in thicket-like young woods, growing in damp rocky soil. The flowers are in long axillary racemes, and bloom late in spring, drooping under the branches. They are succeeded by strings of the two-celled winged fruit of a yellowish green tint. They dangle there all summer. The slender trunks are olive-green, when older becoming a reddish-brown in color, striped with short, delicate streaks of white pigment, which may be scraped off, and for this reason the tree is often called striped maple; it is, however, also known as moose-wood, since the deer are fond of the young shoots when the sugary sap is flowing. The bark is easily stripped off the young branches, leaving white withes from which country folk make whistles. Other whistles are made from the bass-wood (*Tilia americana*), and the name is given in Great Britain to the mountain-ash (*Pyrus*) and to the common and sycamore-ables.

Whistler, whis'ler, **James Abbott McNeill**, American artist: b. Lowell, Mass., 10 July 1834; d. London 17 July 1903. In 1851 he was appointed to the West Point Military Academy, which he left in 1854; and in 1854-5 was a draughtsman in the Coast and Geodetic Survey. This employment he soon quitted, going to England and thence to Paris, where in 1855-7 he was a pupil in the studio of C. G. Gleyre, an artist of Ingres' school who "never drew a line without having first assured himself how Raphael would have proceeded." Previous to the series generally styled the "French Set," Whistler is known to have etched three plates, and other early attempts were almost certainly made. The "French Set," renderings of figures, street scenes, and interiors, appeared in 1858 (published by Delâtre) — 12 plates, with an etched title. But a few copies were printed. In 1863 Whistler went to London and settled in Chelsea. During his earlier days there he completed the 'Thames Set' of etchings, 16 in all, treating of the craft of that stream and the quaint buildings along its edge. Some rare prints of these, generally considered superior, were made before their publication in 1871. 'The Pool' and 'Black Lion Wharf' are among the best of them. He exhibited his paintings quite frequently at the Royal Academy, one of the earliest being 'At the Piano,' purchased by the Scottish painter John Philip for 30 guineas. In 1872 the 'Arrangement in Gray and Black' ('The Painter's Mother'), now in the Luxembourg Gallery, was accepted by the Academy only on the insistence of Sir William Boxall. Whistler sent other pictures, such as 'The Last of Old Westminster,' and 'Symphony in White III,' but he could not agree with the management of that institution, long before his death ceased to exhibit there, and was never made A.R.A. Some of his best work was shown at the Grosvenor Gallery, opened by Sir Coutts Lindsay in 1877, including famous portraits, 'Irving as Philip II.' and the 'Arrangements,' 'Harmonies,' and 'Nocturnes,' novel in title and character. It was in 1877 that Ruskin wrote of the 'Nocturne, Black and Gold' ('The Falling Rocket'), then at the Grosvenor: "I have seen and heard much of cockney impudence be-

fore now, but never expected to hear a coxcomb ask 200 guineas for flinging a pot of paint in the public's face" ('Fors Clavigera'). Then ensued the diverting Ruskin suit, brought for libel by the artist and heard in November 1878. The verdict was for the plaintiff, and the farthing assessed for damages Whistler afterward wore on his watch chain. The costs against Ruskin, £306 12s. 4d., were met by a public subscription. Whistler followed up the affair by his pamphlet, 'Art vs. Art-Critics,' in which he first proved his cleverness in controversial satire. He preferred to exhibit his works under conditions which he could himself direct, and gave a special exhibition in 1874. Others, of either prints or paintings, were held in the rooms of the Fine Arts Society in 1880, 1881, 1883, 1884, and 1886. At the International Society, Knightsbridge, he always had chief place. He became a member of the Royal Society of British Artists in 1884, and in 1886 some "revolutionary members" made him its president. His administration improved the artistic quality of the exhibitions, but was not commercially successful; and in 1889 he failed of re-election and many of his following resigned. His explanation was characteristic: "It is all very simple. The Royal Society of British Artists has disintegrated—the 'artists' have come out, the 'British' remain." He failed for a long time of the recognition he merited, but latterly many distinctions were conferred upon him. He was a member of the Legion of Honor and the Bavarian Order of Saint Michael, member of the Munich, Rome, Dresden, and other academies, in 1900 received the unusual award at the Paris exposition of the gold medal for etching and also for painting, and in 1902 the gold medal of honor from the Pennsylvania Academy of Fine Arts. By many Whistler's etchings have been ranked as the consummate product of his art, classed with those of Rembrandt, and even said to surpass the world's greatest etcher in the process of selecting essentials and a certain subtlety in execution. He did not keep a set of proofs or memoranda of his work, and it is as yet impossible to make a complete list of his etchings. The first catalogue of them appeared in 1874. Wedmore gave 214 in 1886, 268 in 1889; a supplement to Wedmore increased the number to 372. It is probable that with the search certain to be made the list will be brought up to more than 400 prints. It has been said, and probably with much justice, that while Rembrandt chose greater subjects, only a comparatively small part of the total number of his plates is sought by collectors, but all of Whistler's are highly esteemed by connoisseurs. "There are no failures," declares one writer; some are sketchier than others, but all are genuine expressions of Whistler's art. Whistler used an increasing economy of means; the 'First Venice Set,' published by the Fine Arts Society in 1880 (12 plates), and the 'Twenty-six Etchings' (1886), principally of Venetian subjects, though including some English also, show in this respect great difference from the 'French' and 'Thames' sets. The unfailing characteristics of the etchings are precision and flexibility of line, and remarkable picturesqueness in the rendering of shade and light. Their observation and their technical skill are alike noteworthy. Of the single plates may be men-

tioned 'Joe,' 'Little Putney,' 'Battersea Bridge,' 'Old Chelsea,' and 'Speke Hall.' Examples are to be seen in many important public collections, including the Venice Academy, Bibliothèque Nationale, British Museum, the New York Public Library, and the Dresden Gallery. In dry-point and lithography, too, Whistler was very successful. His first lithographs he made in 1877, and he greatly perfected the art. His London exhibition of 1883 contained, besides etchings, a number of dry-points; in 1896 about 70 lithographs were shown at the Fine Arts Society. The Way catalogue, no longer in print, and claiming to include all those printed down to 1897, gave 130, to which at least eight must further be added. The list of nearly 400 etchings and dry-points and 138 lithographs, known to be in existence, reveals a large amount of work, even supposing that the artist had done nothing else. In pastel and water-colors Whistler wrought sparingly, although some of the Venetian pastels are the equals of anything yet attempted in that medium. His creed as a painter he stated in two series of 'Propositions,' and the lecture 'Ten O'Clock' first given in London 20 Feb. 1885. One of the propositions was that a painting had "no mission to fulfil" but was a "joy to the artist, a delusion to the philanthropist, a puzzle to the botanist" Critics he thought a herd of ignoramus; but they had their utility — "they keep one always busy, always up to the mark, either fighting or proving them idiots." For a long time in London he was better known for his pugnacity than for his art. His arrogance, his mordant wit, his sparkling bon-mots, his striking individuality — these were sooner recognized than his genius. He had in oils a broad range of subjects. There are the numerous portraits; marines ('Valparaiso Harbor'; 'Blue Wave — Biarritz'; 'The Ocean'; and landscapes of many sorts, especially those interpretative of night. His method was to apply many coats of thin color instead of one or a few of greater consistency; this guarantees to his work a superior permanence. He was above all the colorist, and in pure line and color harmonies has been called one of the supreme artists. His work has repeatedly been compared to that of Velasquez, but study shows very important dissimilarities, and Whistler must remain unique. He borrowed somewhat from Oriental art, though always subordinating these elements to his own ends. Among portraits not referred to is that of Carlyle, now in the Glasgow Museum, of which the philosopher observed, "Weel, man, you have given me a clean collar, and that is more than Meester Watts has done"; and Sarasate (Pittsburg Academy). Whistler did also some work in interior decoration, such as the music-room of Sarasate (Paris) and the "Peacock-room" for Mr. Leyland (London). Many fine examples of his paintings are in American galleries, public and private. His place in the history of art cannot yet be estimated, but he may safely be put among the greatest painters of the 19th century. No 'Life' has as yet (1904) appeared, and recourse must be had to his own writings, to the extensive periodical literature concerning him, and to the discursive but interesting 'Recollections and Impressions' by Eddy (1903) and Menpes' 'Whistler as I Knew Him' (1904).

Whistlewing, or Whistler, a duck. See **GOLDEN-EYE.**

Whiston, hwis'ton, William, English mathematician and Anglican clergyman: b. Norton, Leicestershire, 9 Dec. 1667; d. London 22 Aug. 1752. He took his degree at Clare Hall, Cambridge, in 1690, and in 1691 was elected to a fellowship there. He was ordained a deacon in 1693, was appointed chaplain to the Bishop of Norwich, and in 1698 became vicar of Lowestoft, Suffolk. He was appointed deputy professor of mathematics to Newton at Cambridge in 1701, and in 1703, upon Newton's resignation, succeeded to the Lucasian professorship. He continued to preach, but having given expression to Arian views, was in 1710 summarily expelled from his professorship and the university. He removed to London where he published 'An Historical Preface to Primitive Christianity Revived' (1711). He was thereupon prosecuted for heresy, but after proceedings lasting five years, was permitted to remain in the English Church. He subsequently engaged in lecturing upon scientific subjects, being among the first to introduce lectures with experiments in London. He founded in 1715 a society for the promotion of Primitive Christianity, the meetings of which were held in his home, and afterward became a Baptist. He made a translation of Josephus (1737) which ran through many editions and wrote: 'New Theory of the Earth' (1696); 'The Accomplishment of Scripture Prophecies' (1708); 'A New Method of Discovering the Longitude' (1714); 'The True Origin of the Sabellian and Athanasian Doctrines of the Trinity' (1720); 'The Testimony of Phlegon Vindicated' (1732); 'The Longitudes Found by the Ellipses of Jupiter's Planets' (1738); 'Memoirs' (1749); etc.

Whitaker, hwit'a-kér, Alexander, American clergyman: b. Cambridge, England, 1585; d. Henrico County, Va., after 1613. He was graduated from Cambridge, was for some years rector of a north of England parish, settled in Henrico County, Va., in 1611, and was active in missionary work. He baptized Pocahontas, and officiated at her wedding. He wrote 'Good News from Virginia,' one of the first books written in the colonies (1613).

Whitaker, John, English Anglican divine: b. Manchester about 1735; d. Ruan-Longhorne, Cornwall, 30 Oct. 1808. He was educated at Oxford. In 1771 he published a 'History of Manchester,' and in refutation of Macpherson's theory that the modern highlanders were descendants of the Caledonians of Tacitus, wrote his 'Genuine History of the Britons' (1772), maintaining that they were descended from an Irish colonization which followed the Roman invasion. In 1778 he was presented by his college to the rectory of Ruan-Longhorne. His most important works are: 'Sermons upon Death, Judgment, Heaven, and Hell' (1783); 'Mary, Queen of Scots, Vindicated' (1787); 'The Origin of Arianism Disclosed' (1791); 'The Course of Hannibal over the Alps Ascertained' (1794); 'Life of Saint Neot' (1809).

Whitaker, Joseph, English publisher: b. London 4 May 1820; d. Enfield, Middlesex, 15 May 1895. In 1849 he started a church monthly called 'The Penny Post,' soon after established a theological publishing business of his own in

WHITAKER—WHITE

Pall Mall, and in 1856-59 was editor of 'The Gentleman's Magazine.' He founded 'The Bookseller' in 1858, but his name is remembered principally in the title of 'Whitaker's Almanac,' which first appeared in 1868. The 'Reference Catalogue of Current Literature' was started by him in 1874.

Whitaker, Nathaniel, American Presbyterian clergyman: b. Long Island, N. Y., 22 Feb. 1732; d. Woodbridge, Va., 21 Jan. 1795. He was graduated from Princeton in 1752, entered the ministry and became pastor of a church at Chelsea, Conn., and visited England in 1765-6, accompanied by Samson Occom, an educated Indian, for the purpose of soliciting funds for the establishment of an institution of learning in America for the use of the Indians. His mission resulted in the foundation of Dartmouth College. He was subsequently engaged in pastoral duties in Massachusetts and in Maine, finally removing to Virginia. He was a staunch Whig and ardently supported the cause of the Colonies during the Revolution. Several of his sermons were published.

Whitaker, Ozi William, American Protestant Episcopal bishop: b. New Salem, Mass., 10 May 1830. He was graduated from Middlebury College, Vt., in 1856 and from the General Theological Seminary in 1863. He took priest's orders in the last named year, was rector of Saint John's, Gold Hill, Nev., 1863-5, of Saint Paul's, Englewood, N. J., 1865-7, and of Saint Paul's, Virginia City, Nev., 1867-9. In 1869 he was consecrated missionary bishop of Nevada, was translated to the diocese of Pennsylvania as assistant bishop in 1886, and upon the death of Bishop Stevens in 1887 became bishop of Pennsylvania.

Whitbread, hwit'brəd, **Samuel**, English politician: b. Cardington, Bedfordshire, 1758; d. 6 July 1815. He was educated at Oxford and Cambridge and entered the House of Commons in 1790 as Whig member for Bedford. He at once made his mark in Parliament as an able advocate of parliamentary reform, religious and civil liberty, the abolition of slavery, and similar liberal causes, and as a strong opponent of Pitt's war policy. He took a leading part in the impeachment of Viscount Melville in 1805-6, and against Lord Chatham for his mismanagement of the Walcheren expedition in 1809. Consult 'The Creedy Papers' (1903).

Whitby, hwit'bi, Canada, capital of Ontario county, a town and port of entry on Lake Ontario, at the southern terminus of the Whitby and Port Perry Railway, and on the Grand Trunk Railway, 30 miles east of Toronto. It has iron foundries, tanneries, manufactures of agricultural implements, mill machinery, and musical instruments, and carries on an active agricultural trade. Pop. (1901) 2,110.

Whitby, England, seaport in the North Riding of Yorkshire, 48 miles north-northeast of York, at the mouth of the Esk, which divides it into two parts. The houses are ranged on bold acclivities, and an ancient restored cruciform church stands on the verge of a lofty cliff; there are several modern churches and Nonconformist chapels; a town hall, court house, museum, temperance hall, seamen's hospital, etc. The harbor is spacious and commodious, having wet and dry docks, etc. The manufacture

of jet ornaments is carried on, this substance being abundant in the neighborhood. There are also yards for ship and boat building, and productive sea fisheries. In 657 Saint Hilda founded her famous priory on the site of Whitby, then called Streonshalh, and in it was held the important Synod of Whitby in 664, at which the Roman usage as regarded Easter was adopted (see EASTER). The poet Cædmon (q.v.) was a resident in this monastery, of which nothing now remains, though the choir, north transept, and part of the nave of an abbey erected on the site in the 11th century are still standing. These ruins are in early English style, and extremely beautiful. The neighborhood is rich in picturesque scenery and interesting features. Pop. (1901) 11,748. Consult: Kitchin, 'Whitby Abbey and Other Essays' (1904).

Whitcher, hwich'ér, Frances Miriam Berry, American humorist: b. Whitestown, N. Y., 1 Nov. 1811; d. there 4 Jan. 1852. She was married in 1847 to Rev. B. W. Whitcher, an Episcopal clergyman of Elmira, N. Y. Her 'Widow Bedott's Table-Talk' first appeared in 'Neal's Saturday Gazette,' published by J. C. Neal, author of 'Charcoal Sketches.' After her death these and other humorous articles of the journalistic type, once very popular, were collected in 'The Widow Bedott Papers' (1855), and 'Widow Sprigg, Mary Elmer, and Other Sketches' (1867).

White, Andrew Dickson, American diplomat, educator and author: b. Homer, N. Y., 7 Nov. 1832. He was graduated from Yale in 1853, and studied at the College of France, Paris, and at the University of Berlin. He was attaché of the American legation at Saint Petersburg in 1854-5 at the time of the Crimean War, and in 1857, shortly after his return to the United States, became professor of history and English literature at the University of Michigan. In 1863 he returned to Syracuse and was elected to the New York State senate, where he was especially interested in educational legislation, obtaining the passage of bills organizing the State normal system, and providing for the codifying of the educational laws. He also had an important part in the founding and organization of Cornell University, and in procuring for that institution the national land grant for agricultural colleges; in 1867 he became president of the university, and was also professor of history. He maintained his connection with Cornell until 1885, when he resigned both presidency and professorship. He gave to the university his excellent historical library of about 30,000 volumes, and on the acceptance of this gift the departments of history and economics were reorganized as the White School of History and Political Science. While president of Cornell, he was also active in public affairs; in 1871 was one of a commission to study and report on the desirability of annexing Santo Domingo; in 1878 was honorary commissioner to the Paris exposition, and in 1879-81 minister to Germany, during which time he had leave of absence from the university. In 1892-4 he was minister to Russia; in 1896 was one of the commissioners to investigate the Venezuela boundary question; and in 1897-1902 was ambassador to Germany, holding that position longer than any other American minister. Before his

WHITE

retirement from the German ambassadorship he was elected a member of the Berlin Academy of Sciences. In 1899 he was president of the United States delegation to the Hague Peace Conference. He has written 'History of the Warfare of Science against Theology' (1898), an enlargement of his 'Warfare of Science' (1876); 'Studies in General History'; 'The New Germany'; 'European Schools of History'; 'Paper Money Inflation in France' (1876); 'Chapters from My Diplomatic Life' (Century Magazine, 1903).

White, Arnold, English author. He has published 'The Modern Jew' (1899); 'Problems of a Great City'; 'English Democracy'; 'Efficiency and Empire.'

White, Arthur Silva, English publicist: b. London 1 Feb. 1859. He was secretary to the Royal Scottish Geographical Society and editor of the 'Scottish Geographical Magazine' in 1884-92, and for 15 years was engaged in foreign travel. In 1898 he explored the oasis of Siwa, and in 1900 traveled in the Sudan. His publications include: 'Development of Africa' (1890); Report to the Paris Geographical International Congress (1898); 'From Sphinx to Oracle' (1899); 'The Expansion of Egypt' (1899); etc.

White, Charles Abiathar, American geologist: b. North Dighton, Mass., 26 Jan. 1826. He was State geologist of Iowa in 1866-70, occupied the chair of natural history at the Iowa State University in 1867-73, and in 1873-5 held that chair at Bowdoin College, Maine. In 1874-92 he was engaged as geologist and paleontologist on different United States government surveys, and since 1876 has been connected honorarily with the Smithsonian Institution and the United States National Museum, where he is now associate in paleontology. He has published 'Report on the Geological Survey of Iowa' (1870); 'Report on Invertebrate Fossils and Surveys West of the 100th Meridian' (1875); 'Review of the Fossil Ostreidae of North America' (1881); 'The Relation of Biology to Geological Investigation' (1894); etc. A complete list of his writings, including 211 titles (1860-85) was catalogued by J. B. Marcott (1885).

White, Edward Douglass, American jurist: b. parish of Lafourche, La., 3 Nov. 1845. He was educated at Mount Saint Mary's College, Md., and at the Jesuit College in New Orleans and during the Civil War served in the Confederate army. He subsequently studied law and was admitted to the Louisiana bar. He was State Senator in 1874; associate justice of the Supreme Court in Louisiana in 1878; and United States Senator in 1889-94. While still a member of the Senate he was appointed an associate justice of the United States Supreme Court.

White, Edwin, American naval officer: b. Ohio 1843; d. Brooklyn, N. Y., 23 Dec. 1903. He was graduated from the United States Naval Academy in 1864; was promoted lieutenant-commander in 1869, commander in 1886, was on duty at the Naval Academy as commander of cadets in 1895-98, received rank as captain in 1898 and was assigned to command the 'Philadelphia' flagship at the Pacific station. He returned from Samoa in 1899 with broken health

and was retired from active duty with rank of rear-admiral.

White, Eliza Orne, American author: b. Keene, N. H., 2 Aug. 1856. Her publications include: 'Miss Brooks' (1890); 'Winter-borough' (1892); 'When Molly Was Six' (1894); 'The Coming of Theodora' (1895); 'A Little Girl of Long Ago' (1896); 'A Browning Courtship and Other Stories' (1897); 'A Lover of Truth' (1898); 'Edna and Her Brothers' (1900); 'John Forsyth's Aunts' (1901).

White, Frank, American politician: b. Stillman Valley, Ill., 12 Dec. 1856. He was graduated in civil engineering from the University of Illinois in 1880. A few years later he moved to North Dakota, where he became active in politics as a Republican; in 1891-3 he was a member of the lower house of State legislature, and in 1893-9 a member of the senate. During the Spanish-American war he joined the army, was major of the 1st North Dakota regiment and served in the Philippines. In 1901 he was elected governor of the State for a term of four years.

White, Sir George Stuart, English soldier: b. 6 July 1835. He was educated at Sandhurst, entered the army in 1853, served in the Indian mutiny and the Afghan war, became military secretary to the viceroy of India, and in 1881 lieutenant-colonel of the Gordon Highlanders. His subsequent promotions were colonel (1885), lieutenant-general (1895), major-general, and field marshal. From 1893 to 1898 he was commander-in-chief of the forces in India, in 1898-99 quartermaster-general to the forces, and in 1899-1900 was general on staff to command troops at Ladysmith. He defended Ladysmith 118 days (2 Nov. 1899-18 Feb. 1900) against the Boers, being relieved by Lord Dundonald after a disastrous siege. In 1900 he was made governor of Gibraltar. See SOUTH AFRICAN WAR.

White, Gilbert, English naturalist: b. Selborne, Hampshire, 18 July 1720; d. there 26 June 1793. He was graduated from Oriel College, Oxford, in 1743, and having taken deacon's orders in 1747, acted as curate to an uncle at Swarraton. After being ordained priest he was for a short period in 1751 curate to the vicar of Selborne. Appointed dean of his college in 1752 he soon after became curate of Dnrley, Hampshire. He failed to secure the provostship of Oriel in 1757, but in the same year obtained the vicarage of Morton Pinkney, in Northamptonshire, which was in the gift of his college. He never resided on his Northamptonshire living, but throughout his whole life remained closely associated with the Hampshire parish which he has made famous. About 1758 he gave up the Dnrley curacy for that of Faringdon, near to his home, though for a time he acted as curate of West Deane, Wiltshire. White's great English classic 'The Natural History and Antiquities of Selborne,' the only work of the kind in the language to attain that rank, was published at the end of 1788, with the date 1789 on the title page. It consists of letters to his two friends, Thomas Pennant, author of the 'British Zoölogy,' and Daines Barrington, who devised the form of 'Naturalist's Journal' which White kept from 1767, when he

WHITE

discontinued the 'Garden Kalendar' begun in 1751. In the preparation of the part on antiquities, compiled only when he had been induced to publish, he was greatly assisted by Richard Chandler, the classical antiquary and traveler. His 'Natural History of Selborne' has won the enthusiastic admiration of men of widely different tastes, and has gone through a very large number of editions. Professor Newton says that such was White's keenness of observation, his undoubted errors are scarce worthy of notice. In America, where most of the plants and animals mentioned are, save to a few experts, known only by name, the popularity of the work has been great. The most important editions after the first are the following: the so-called Markwick's or Aikin's (1802), including 'The Naturalist's Calendar,' which Dr. Aikin had compiled from White's papers and published in 1795, but excluding the 'Antiquities'; the 1813 octavo, including his poems for the first time; Mitford's (1813); Rennie's (1833); Bennett's (1837), based upon the preceding; Jardine and Jesse's (1851); Jardine's (1853); Harting's (1875), one of the best, based upon Bennett's; Buckland's (1875), with a chapter on the 'Antiquities' by the Earl of Selborne; Bell's (1877), which superseded all previous ones, and may still be regarded as the best (see BELL, THOMAS); Grant Allen's (1899), without the 'Antiquities'; and Bowdler Sharpe's (1900-1901), including the 'Antiquities' and the 'Garden Kalendar.' There is a bibliography (1897) by E. A. Martin. Consult further: Jesse, 'Gleanings in Natural History' 2d series (1834); Gordon, 'Gilbert White in Sussex' (1893); and the considerable amount of magazine literature.

White, Greenough, American educator and Episcopal clergyman: b. Cambridge, Mass., 26 July 1803; d. Sewanee, Tenn., 3 July 1901. He was graduated from Harvard in 1884, was professor of English language and literature at the University of the South, Sewanee, Tenn., in 1885-7, occupied that chair at Kenyon College in 1888-9, and in 1893 became a deacon in the Episcopal Church. He served as minister at Saint James' Church, West Hartford, Conn., in 1893-4, at the same time occupying the chair of history and political economy at Trinity College, Hartford. In 1894 he returned to his position at the University of the South, which he occupied until his death. He was ordained to the priesthood in 1896, and in 1897 became acting professor of the history of art at the university. He wrote: 'Sketch of the Philosophy of American Literature' (1890); 'A Saint of the Southern Church' (1897); 'An Apostle of the Western Church' (1899); 'Outline of the Philosophy of English Literature'; 'The Rise of Papal Supremacy'; etc.

White, Henry Kirke, English poet: b. Nottingham 21 March 1785; d. Cambridge 19 Oct. 1866. The son of a butcher, he was apprenticed to a stocking weaver, and later to an attorney, in whose office he devoted his spare time to the study of Latin and Greek. At 14 he wrote verse which was published in different magazines, and in 1803 published 'Clifton Grove, a Sketch in Verse, with Other Poems,' a venture which won for him the attention and friendship of Southey and other literary men.

He obtained a sizarship at Saint John's College, Cambridge, in 1804, and entered upon his studies with such close application that his health broke under the strain, resulting in his death from consumption. After his death his manuscripts were placed in charge of Southey, who edited his poems, letters, etc., and published them under the title 'Remains, etc., with an Account of his Life' (1807). He will be longest remembered by his hymn beginning

"When marshalled on the nightly plain
The glittering host bestud the sky."

White, Hervey, American author: b. New London, Iowa, 26 Nov. 1866. He was graduated from Harvard in 1894 and was reference librarian in the John Crerar library 1896-99. He has published 'Differences' (1899); 'Quicksand' (1900); 'When Eve was not Created, and Other Stories' (1900); 'Noll and the Fairies' (1902).

White, Horace, American journalist and editor: b. Colebrook, N. H., 10 Aug. 1834. He was graduated from Beloit College in 1853, removed to Chicago, and there became city editor of the *Evening Journal* in 1854. He was later connected with the *Chicago Tribune*, and accompanied Lincoln during his campaign against Stephen A. Douglas in 1858, his narrative of the famous debates being given in Herndon's life of Lincoln. He was editor of the *Chicago Tribune* in 1865-74 and in 1887 removed to New York, where he became associated with Carl Schurz and E. L. Godkin in editing the *Evening Post*. He was editor-in-chief of that publication from 1899 to 1903, when he retired, though still remaining connected with the paper. Among his publications are: 'The Silver Question'; 'Money and Banking Illustrated by American History' (1895, 2d ed. 1902); 'The Gold Standard'; etc. He edited Luigi Cossa's 'Scienza delle Finanze' (1880); and translated Appian's 'Roman History' (1899).

White, Hugh Lawson, American jurist and legislator: b. Iredell County, N. C., 30 Oct. 1773; d. Knoxville, Tenn., 10 April 1840. He served as a volunteer against the Cherokees in 1792, studied law and began practice at Knoxville in 1796. He was judge of the supreme court of Tennessee, 1801-7 and 1809-15, became United States district attorney in 1807, in 1809 was elected to the State senate, was president of the Bank of Tennessee in 1815-27, State senator in 1817-25, United States commissioner in 1821-4 for the adjustment of claims against Spain, and in 1825 was elected to the United States Senate to succeed General Jackson. He was opposed to the making of internal improvements by the Federal government and led in the movement which resulted in the abolishment of the National Bank. He was an earnest advocate of the removal of the Indians west of the Mississippi, and by his support of the bill to limit executive patronage incurred the enmity of Jackson. In 1835 he was nominated for the presidency and received 25 votes in the electoral college. He became a declared Whig in 1838 and in 1839 resigned his seat in the Senate because of his unwillingness to vote for the Sub-Treasury Bill, as he had been instructed to do by the Tennessee legislature. Consult Nancy N. Scott, 'M memoir of Judge White' (1856).

WHITE

White, John Blake, American artist and author: b. Eutaw Springs, S. C., 2 Sept. 1781; d. Charleston, S. C., 24 Aug. 1859. He studied under Benjamin West in London in 1800-04. Returning to the United States, he established himself in Boston, but on account of the lack of practice went to Charleston, S. C., and became a lawyer, was successful in that profession, and was several times a member of the South Carolina legislature. His best known picture, 'The Unfurling of the United States Flag in the City of Mexico,' was destroyed during the Civil War. His other paintings include: 'Battle of Eutaw Springs' (1804); 'Battle of Fort Moultrie' (1806) 'Battle of New Orleans'; 'Mrs. Motte Presenting the Arrows'; and 'Marion Inviting the British Officer to Dinner' (1836). He also wrote the dramas 'Foscari, or the Venetian Exile' (1805); 'Mysteries of the Castle' (1806); 'Modern Honor' (1812); 'Triumph of Liberty, or Louisiana Preserved' (1819); and 'Intemperance' (1839).

White, John Hazen, American Protestant Episcopal bishop: b. Cincinnati, Ohio, 10 March 1849. He was graduated from Kenyon College in 1872 and Berkeley Divinity School, Middletown, Conn., in 1875. He was ordained priest in 1876, was rector of Grace Church, Old Saybrook, Conn., 1878-81; of Christ Church, Joliet, Ill., 1881-89; St. John's Church, St. Paul, 1889-91, and warden of Seabury Divinity School, Faribault, Minn., 1891-95. In the last named year he was consecrated bishop of Indiana, and on the division of the diocese in 1899 chose the northern portion with the title of bishop of Michigan City.

White, John Williams, American classical scholar: b. Cincinnati, Ohio, 5 March 1849. He was graduated from the Ohio Wesleyan University in 1868, and studied at Harvard and at Berlin. He occupied the chair of Latin and Greek at Willoughby College in 1868-9, at Baldwin College in 1869-71, continuing there as professor of Greek alone in 1871-4. He was tutor of Greek at Harvard in 1874-7, assistant professor there in 1877-84, and since then has been full professor. His publications include: 'Œdipus Tyrannus of Sophocles' (1873); 'First Lessons in Greek' (1876); 'Realia of Greek Literature' (1882); 'The Old Scholia on the Aves of Aristophanes' (1903); etc. He was senior editor of 'The Colledge Series of Greek Authors' (30 vols., 1879).

White, Joseph Blanco, English clergyman and author: b. Seville, Spain, 11 July 1775; d. Liverpool 30 May 1841. After study in Seville University, he was ordained sub-deacon (1796) and priest (1800) in the Roman Catholic Church, in 1802 was appointed to a chaplaincy in the Chapel Royal of Saint Ferdinand at Seville, but, having abandoned his belief in Christianity, withdrew from the priesthood, and went to England in 1810. There he became editor of 'Español,' a monthly periodical, circulated in Spain (partly by the English government) in aid of the national cause; in 1812 again became a Christian; and in 1814 qualified as an English clergyman. He began contributing in 1820 to the 'New Monthly,' edited by Thomas Campbell (q.v.), and in 1825 published 'Evidences against Catholicism.' In 1826 he settled at Oxford as a member of Oriel,

and there Newman, Pusey, and other leaders of the Oxford movement learned much from him respecting Catholic theology. He finally became an acknowledged Unitarian, and from 1835 lived at Liverpool, doing some desultory literary work. Many of his books had a real interest in their time, but he is best known to literature by his sonnet 'Night and Death,' which Coleridge, in a letter of 1827, declared to be the finest in the English language. Among his further publications are: 'Letters from Spain by Don Leucadio Doblado' (1822), 'Second Travels of an Irish Gentleman in Search of a Religion' (1833; in answer to Thomas Moore's 'Travels'), and 'Observations on Heresy and Orthodoxy' (1835).

White, Octavius Augustus, American physician: b. Charleston, S. C., 8 Feb. 1826; d. New York 25 May 1903. Graduated from the College of Charleston in 1846, and from the South Carolina Medical College in 1848, he practised with success until the outbreak of the Civil War, when he was made surgeon in the Confederate army. He became an expert on yellow fever, during the war was sent within the Union lines at Goldsborough, N. C., for medical services connected with the fever, and wrote much on the subject, as well as on general topics of medicine and surgery. Several professional inventions are to be credited to him.

White, Percy, English novelist: b. London 1852. He taught English literature and language in a French college for some years, entered journalism in 1880 and for ten years edited 'Public Opinion.' He has published several brilliant novels, strongly satirical in character, among them being: 'Mr. Bailey-Martin' (1893); 'Andria' (1896); 'A Millionaire's Daughter' (1898); 'The Heart of the Dancer' (1900); 'The New Christians' (1902).

White, Peregrine, the first child born in New England of English parents: b. on board the Mayflower, in the harbor of Cape Cod 20 Nov. 1620; d. Marshfield, Mass., 22 July 1704. He was the son of William and Susanna White, and on account of his birth received 200 acres of land from the general court. He filled various civil and military offices, and "was vigorous and of a comely aspect to the last." His father died during the colonists' first winter at Plymouth, and the marriage of his mother to Gov. Edward Winslow was the first wedding in New England.

White, Richard Grant, American author and critic: b. New York 22 May 1821; d. there 8 April 1885. He was graduated from the New York University in 1839, studied medicine and then law, and became a contributor of musical, art, and dramatic critiques to the New York *Courier and Enquirer*. From 1854 to 1859 he was an editor of this journal; and of the *World* 1860-1. His 'Yankee Letters,' contributed in 1863-7 to the London 'Spectator,' were interesting narratives of contemporary events and of considerable service to the national cause. In 1861-78 he was chief clerk of the United States revenue marine bureau for the district of New York. White was particularly known as a Shakespearean scholar. He contributed articles on Shakespeare, to 'Putnam's Magazine' in 1853, in 1854 published 'Shakespeare's Scholar,' and in 1857-63 a critical edition of the

poet's works. Other volumes on this general subject were, 'Essay on the Authorship of the Three Parts of Henry the Sixth' (1859); 'Memoirs of William Shakespeare, with an Essay toward the Expression of his Genius' (1865), and the posthumous 'Studies in Shakespeare' (1885). White's 'Riverside edition' of Shakespeare (1883) was one of the most popular prepared by an American. He was also one of the leading American critics of his time, dogmatic at times and over-hasty in generalization, but vigorous, acute, and frequently brilliant. Philological studies were represented by his 'Words and their Uses: A Study of the English Language' (1870, rev. ed. 1872), and 'Every-Day English' (1881). The most widely circulated of his writings was the anonymous satire 'The New Gospel of Peace' (1863-6). He also wrote a novel, 'The Fate of Mansfield Humphreys' (1884), and edited 'Illustrated Record of the New York Exhibition of the Industry of All Nations' (1854), and 'Poetry, Lyrical, Narrative, and Satirical of the Civil War' (1866). His scholarship was considerable, his style readable and often marked by satire, and his authority in his day decided. An interesting article regarding him by F. P. Church appeared in the 'Atlantic' for March 1891 (vol. 67).

White, Stanford, American architect: b. New York 9 Nov. 1853. He was graduated from the University of New York and received his professional training under Charles D. Gambrill and H. H. Richardson, and was the chief assistant of the latter in the construction of Trinity Church, Boston. In 1881 he became a member of the firm of McKim, Mead & White. He is the designer of Madison Square Garden, the Washington Arch, and other important structures.

White, Stewart Edward, American novelist: b. Grand Rapids, Mich., 12 March 1873. He was graduated from the University of Michigan in 1895 and studied law at the Columbia Law School 1896-7. He has published stories of Western life, including 'The Westerners' (1901); 'The Claim Jumpers' (1901); 'The Blazed Trail' (1902); 'Conjuror's House' (1903); 'The Forest' (1903).

White, William, American Protestant Episcopal bishop: b. Philadelphia, Pa., 4 April 1748; d. there 17 July 1836. He was graduated at the College of Philadelphia in 1765, completed his theological studies in 1770, and going to England to obtain holy orders, was admitted to the diaconate by the bishop of London in 1770, and to the priesthood by the bishop of Norwich in 1772. Returning to Philadelphia, he became assistant minister and afterward rector of Christ Church and St. Peter's Church, being at one period the only Episcopal clergyman in Philadelphia, and in 1777 was chaplain to Congress. the degree of D.D., the first honorary degree of the University of Pennsylvania, was conferred on him in 1782. The meeting which issued the summons for a convention preparatory to organizing the Protestant Episcopal Church, was held at his house in 1784 and he presided over the 1st General Convention in 1789. In 1786 he was elected bishop of Pennsylvania and was consecrated in Lambeth palace, England, 1787. He wrote 'Memoirs of the Protestant Episcopal Church' (1820); 'Lectures on the Cate-

chism' (1813); etc. Consult: 'Memoir,' by Bird Wilson (1839); McConnell, 'History of the American Episcopal Church' (1890).

White, William Allen, American author: b. Emporia, Kan., 1868. He was educated at the University of Kansas and in 1890 became editor of the *Eldorado Daily Republican*. He afterward was engaged on the editorial staffs of the *Kansas City Journal* and of the *Star*, and in 1894 purchased the *Emporia Gazette*. His editorial, 'What's the Matter with Kansas?' published in that paper in August 1896 was read and reprinted throughout the country. He has published 'The Real Issue' (1896); 'The Court of Boyville' (1899); 'Stratagems and Spoils' (1901); etc.

White, William Hale, "MARK RUTHERFORD", English author. Under the pseudonym "Mark Rutherford" he has published such notable books as 'The Autobiography of Mark Rutherford'; 'Mark Rutherford's Deliverance' (1885); 'Miriam's Schooling' (1890); 'The Revolution in Tanner's Lane' (1887); 'Pages from a Journal' (1900); etc.

White, Sir William Henry, English naval constructor: b. Devonport 2 Feb. 1845. He was educated at the Royal School of Naval Architecture, served in the constructive department of the Admiralty, 1867-83, becoming chief constructor, and from 1870 to 1881 was professor of naval architecture at the Royal School of Naval Architecture and at the Royal Naval College. In 1883-5 he organized and directed the warship building department of Armstrong & Company, Newcastle. From 1885 to 1902 he was director of naval construction and assistant controller of the navy, and during that period was the responsible designer of all British ships of war. Upon his resignation, due to failing health, he received from Parliament a special money grant in recognition of his services to the navy. He has published: 'A Manual of Naval Architecture'; 'Architecture and Public Buildings'; 'A Treatise on Shipbuilding'; and numerous professional papers.

White Ants. See TERMITES.

White Bass. See BASS.

White Book, a government publication in Germany and Portugal, corresponding to the British Blue Book and the Yellow Book of France. See BLUE BOOKS.

White Boys, an illegal association formed in Ireland in 1760, composed of starving day-laborers, evicted farmers, and others in a like condition, who used to assemble at nights to destroy the property of landlords or their agents, the Protestant clergy, the tithe collectors, or any others that had made themselves obnoxious in the locality. In many cases they did not confine their acts of aggression merely to plunder and destruction, but even went the length of murder.

White Brethren, a sect which caused a commotion in Europe about the beginning of the 15th century. A priest whose origin is unknown, his nationality being variously alleged as Spanish, French and Scotch, made his appearance in Lombardy, and said that he was the prophet Elias, and had come back from heaven to give notice of the coming destruction of the world. He had thousands of followers, who were arrayed in white, and carried large cruci-

WHITE CAMELIA, KNIGHTS OF— WHITE CROSS SOCIETY

fixes, as they marched from the Ligurian Alps into central Italy. Pope Boniface IX. caused him to be apprehended, and he was burned as an impostor. The White Brethren then dispersed.

White Camelia, The Knights of the, formed in May 1867 at New Orleans, was the largest of the revolutionary orders called into existence by the misgovernment of Reconstruction. Its principal strength was in the Gulf States, farther south than the Ku Klux Klan. The organization was as follows: a Supreme Council for the United States; a Grand Council in each State; a Central Council in each congressional district; and Councils in each county. Each council was divided into circles and groups. The officers of the council were known as commander, lieutenant-commander, sentinel, secretary and treasurer; with the prefixed adjectives, supreme, grand, or eminent, for the officials of the three higher ranks of councils. The members were called "brothers." The objects of the order were, to nullify radical legislation, to reduce the influence of the blacks in politics, to prevent amalgamation of the races, and to defend the white race against radical encroachment. The members swore to vote for no black for office, to observe always a marked distinction between the races, to maintain the social and political superiority of the white race, at the same time protecting the blacks in the privileges rightfully theirs. The constitution forbade the endorsement of any political party by the order. Each member was free to vote as he pleased, subject to his oath always to oppose negroes for office, or those favorable to negro political rights. The order operated also as a body of regulators using such methods as were usually attributed to the Ku Klux Klan. The membership was of a higher order than that of the Klan; the discipline was good and the order never degenerated so badly as the Ku Klux. The effect of its operations was to control the lawless negroes, intimidate and drive from the country the carpetbaggers, and to secure again to the whites control of the State and county governments. These objects accomplished, the order gradually disbanded. Its secrets were well kept and not until recent years was anything definite known of the order. The White Brotherhood and the White League were closely related orders that existed in the same territory a few years after the White Camelia had disintegrated.

Consult: Brown, 'Lower South in American History' (1902); 'Constitution and Ritual of the Knights of the White Camelia,' in West Virginia University Documents relating to Reconstruction, Nos. 1 and 2.

WALTER L. FLEMING,
West Virginia University.

White Caps, in American history, a name applied to lawless bands in southern Indiana, who, from 1880, undertook the regulation of the manners and morals of that section. During the Civil War the Knights of the Golden Circle (q.v.) flourished in the same parts. The white caps dressed differently in different parts of the country which they terrorized. Where they were regularly organized and did the most mischief they generally had nearly a full uniform or regalia. They wore white paper foolscaps, with paper masks, and coats of coffee sacking. To make the coats they merely cut arm or sleeve

holes in the sides of coffee sacks close to the bottoms and holes in the bottoms to put their heads through. The whole White Cap movement was borrowed from English outlawry.

White Cattle (of Chillingham), certain cattle preserved in a semi-wild state in Chillingham Park, England. They are pure white, except the muzzle, which is black, and the horns which are tipped with black. The white color on the body, however, is artificially produced, the owner causing all spotted calves to be killed. They are now generally believed to be the descendants of the mountain bull or urus (see Ox), which was wild in Gaul at the time of Cæsar's invasion, and the stock whence modern breeds of domestic English cattle have been partly derived. Dawkins, however, considers them the last surviving representatives of a still more primitive race, the gigantic ox, known by its remains in caves to have occupied Great Britain in the Pleistocene Period. He considers them much modified in every respect by their small range and their contact with man.

White Clover, Oak, Pine, etc. See CLOVER; OAK; etc.

White Colors, in painting, white pigment or white lead. Baryta yields several commercial varieties of white color, largely used for adulterating white lead. The substances used are heavy spar, the native sulphate, and witherite, the native carbonate, of baryta. An artificial sulphate of baryta is also used in permanent white. Zinc white or Chinese white is a hydrated oxide of zinc, and pearl white is yielded by the nitrate of bismuth. A fine chalk yields Spanish white, and whiting is ordinary ground chalk. Quicklime is a sanitary white for external walls, etc.

White Cross, a self-supporting American organization, with a large membership throughout the Union, having for its motto, "Truth, Charity and Philanthropy," and for its emblem cross bandages of white on a field of red. It was founded in 1898 by Mrs. Jane Creighton, of Portland, Oregon, and its object is the care of wounded and sick American soldiers and sailors, and aid to the widows and orphans of those who have fallen in battle, or died of disease or accident.

White Cross Society, an association founded in England, in 1883, by the Bishop of Durham, and introduced in the United States in that year by the Rev. B. F. De Costa, rector of the Protestant Episcopal Church of Saint John the Evangelist, New York, who became a Roman Catholic in 1899. The objects of the society are "to urge upon men the obligation of personal purity; to raise the tone of public opinion upon the subject of morality; to secure proper legislation in connection with morality." Those who become members of the society promise "by the help of God," to treat all women with respect, and endeavor to protect them from wrong and degradation; to endeavor to put down all indecent language and coarse jests; to maintain the law of purity as equally binding on men and women; to endeavor to spread these principles, and try to uplift younger brothers, and to use every possible means to fulfil the command, "Keep thyself pure." The society seeks to forward its objects "by the full presentation of those spiritual truths which form distinguishing characteristics of Christianity, and demonstrate its

WHITE-CROWNED SPARROW — WHITE LEAD

unalterable hostility to every form of impurity." The society has been established also in Canada.

White-crowned Sparrow. See SPARROW.

White Eagle, Order of. See ORDERS, ROYAL.

White Elephant, an elephant affected with albinism. Such animals, always rare, are highly esteemed by some Eastern potentates, and are considered sacred in Siam, where the animal has become a national symbol, so that Siam is called "the land of the white elephant," and one of the highest decorations conferred by its rulers is that of the Order of the White Elephant. A specimen purchased by the late P. T. Barnum from King Theebaw, of Burma, was brought to the United States in 1884. It stood seven feet and a half high, and the face, ears, front of trunk, fore feet, and part of breast were of a light ash color.

Figuratively, a present which does one much more harm than good, or more generally any nominal advantage which has this effect. It is reported that when in old times the ruler of Siam desired to ruin any one, he made him a present of a white elephant. The sacred elephant has an enormous appetite, and, being sacred, it would be a crime to let it die, so that the gift generally entailed ruin on the recipient.

White-eyes, one of the numerous small insectivorous birds of the New Zealand region, called blight-birds there, because they feed so largely upon the plant-lice which torment garden plants and orchard trees. They belong to the genus *Zosterops*, which is variously classified by ornithologists, but seems most nearly related to the titmice. Other species are scattered elsewhere throughout the Old World tropics. All are neatly but not gaudily dressed, have in most cases a conspicuous ring of white feathers around the eye, and build pretty nests. The genus is interesting, further, from the fact that many of its species are confined to small islands, apparently affording examples of the effect of isolation (q.v.).

White Feather, a symbol of cowardice; a term introduced in the days when cock fighting was in vogue. As a thoroughbred game cock has no white feathers, a white feather was a proof that the bird was not game.

White Fly, a minute insect of the family *Aleyrodidae*, closely allied to the aphids and coccids, which infest the leaves of plants, usually on the lower side, and are pests in greenhouses. (See GREENHOUSE INSECTS.) They are covered with a whitish mealy secretion, and when young also secrete wax. The group is not a large one, and does not do much harm to fruit or forest trees, except that one species (*Aleyrododes citri*) has been prevalent in Florida orange groves since about 1890. The evil they do results not only from their sucking the nutritive juices of the plants, but from the spread of smut-fungus which is promoted by their presence. Consult Howard, 'The Insect-book' (New York 1901).

White Friars, a name formerly given to the friars of Our Lady of Mount Carmel, because they wore a white scapular and cloak over their brown habit. See CARMELITES.

White Goat. See ROCKY MOUNTAIN GOAT.

White Hats, a badge of the Democratic party in Flanders in the 14th century. White

hats were used in England to denote radical proclivities, because Orator Hunt (1773-1835), the great demagogue, during the Wellington and Peel administration, used to wear a white hat.

White Hellebore, a liliaceous plant of the genus *Veratrum*, a source of insect-poison, the principle of which is the alkaloid veratrin. See also HELLEBORE.

White House, the official residence of the President of the United States, in Washington, D. C. The name arose from the fact that the building is constructed of freestone and painted white. It is 170 feet long, 86 feet deep, and two stories in height. It has an Ionic portico, the main entrance faces north. Reception rooms are on the first floor and the private apartments of the President are on the second floor. Among the reception rooms are the Blue Room used for diplomatic functions, the East Room used for public receptions, and the Red and Green rooms. The original official residence for the President was begun in 1792; it was first occupied by Adams, in 1800. In 1814 it was burned by the British, and four years later was rebuilt. In 1903 executive offices connected with the main building were built on the grounds. Presidents Harrison and McKinley used for the official name, "Executive Mansion"; President Roosevelt changed to the old name, White House.

White Lady, an apparition which figures in the legends and traditions of various countries, as presenting itself to give warning of death and other momentous events in royal and titled households. The White Lady is supposed to be an ancestress of the family she visits, and the association of such a legend with a family name is regarded as a guarantee of noble and ancient lineage. The imperial house of Hohenzollern has its White Lady, and Hampton Court, England, is said to be invaded at times by a supernatural visitor, although there seems to be some doubt whether it is a White Lady or the ghost of Henry VIII.

The earliest historical instance of the apparition is recorded as having occurred in the 15th century, and is celebrated under the name of Bertha of Rosenberg, in Bohemia. Similar appearances are said to have been witnessed in the Schloss at Berlin, one as recent as 1879.

As a considerable number of estates of European titled personages are passing into new and plebeian ownership the question has arisen whether the White Lady is transferred with the property, or follows the old family into poorer quarters in some city tenement.

White Lead, a white pigment very largely used in painting. Many processes have been devised for its manufacture, but only the important ones will be described here. The old Dutch method was to expose sheet lead in coils, placed in earthenware jars partly filled with vinegar, to the combined action of air, moisture, and carbonic acid gas. This was done by immersing the jars with their contents in decomposing horse manure which furnished the heat and carbonic acid gas necessary for the process. The English process, which is the one by which most of the white lead is made, differs from the Dutch process by the use of fermenting tan bark instead of manure. The pots containing the lead and dilute acetic acid or vinegar are piled in rows in the so-called stacks and surrounded with the fermenting tan bark. After about three

WHITE LEAGUE—WHITE PLAINS

months the lead is removed and purified. The process is slow and the methods of purification dangerous to the workmen, but the resulting white lead is of the best quality. In the French method a solution of basic lead acetate is first prepared by the action of an impure acetic acid on litharge or lead oxide. Carbonic acid gas is then passed through this solution and the white lead precipitated.

White lead is a basic carbonate of lead of somewhat variable composition. That formed by the Dutch and English processes may be represented by the formula $2\text{PbCO}_3 \cdot \text{Pb}(\text{OH})_2$.

White League, The, in American history, a popular name for a semi-military organization, gathered to repress the negroes of the State of Louisiana, who, it was asserted, were meditating insurrection. The organization had its inception in New Orleans, in 1874, and on the refusal of the city authorities to allow the landing of a cargo of firearms, which the league had imported from New York, a riot ensued which resulted in more than 100 deaths. The league afterward became a powerful factor in Louisiana politics.

White Metal, a term used for an alloy of lead, antimony, and tin used for bearings in machinery. Also applied to many other alloys that have a white color.

White Monks. See *Bernardines* under **ORDERS, RELIGIOUS.**

White Mountains, a group of peaks and hills, or a range of mountains, principally in New Hampshire, in the northern part; but which extend into Maine on the east, and on the west are connected with the Green Mountains in Vermont. They belong to the Appalachian system. Mount Katahdin, in Maine, is the highest elevation on the eastern rim; and in New Hampshire there are about 20 peaks, with deep narrow valleys and long lines of rounded foot-hills. The peaks are in two groups; the eastern or White Mountain group proper and the Franconia group, separated by a tableland varying from 10 to 20 miles in width. The principal summits of the eastern group are, beginning at the Notch and passing around to Gorham, Mounts Webster, Clinton, Pleasant, Franklin, Monroe, Washington, Clay, Jefferson, Adams, and Madison. Of these Mount Washington is the highest, and is indeed the highest mountain summit in New England, being 6,293 feet above the level of the sea. The principal peaks of the Franconia group are Pleasant, Lafayette, Liberty, Cherry, and Moosehillock. Near the southern border of the plateau are Whiteface, Chocorua, Red Hill, and Ossipee, and in the southeast, Kearsarge. North of the plateau, and near the upper waters of the Connecticut, are several elevations, among which are the twin mountains known as Stratford peaks. The plateau is deeply furrowed by several streams. The geological formation of the White Mountains is almost entirely of the ancient metamorphic rocks. In many of the peaks the upper portion is composed of huge masses of naked granite or gneiss; and the debris which in the course of ages has clothed the lower portion with a coarse gravelly soil, possesses only enough of the constituents of vegetable life to support those trees and shrubs which will grow in the hardest and poorest soil. Land slides, not the result of a glacier movement, but of dislodgment of boulders and loosely adherent soil after heavy rains, are not infrequent. One of these,

occurred in the notch of the White Mountain group in August 1826, and destroyed a whole family named Willey, consisting of nine persons. The most noteworthy of many waterfalls among the mountains are: the Artist's fall in North Conway; the Silver Cascade, a beautiful thread of water descending from far up the side of Mount Webster; Ripley's falls, on a tributary of the Saco, below the Willey house, the lower one, Sylvan Glade cataract, falling, at an angle of 45° , 156 feet, in a stream from 50 to 75 feet in width; the falls of the Ammonoosuc, which in a course of 30 miles descends over 5,000 feet; the Berlin falls on the Androscoggin, descending over 200 feet in the course of a mile; and the Crystal Cascade and Glen Ellis Fall, near the Glen house, on a tributary of the Androscoggin. Of the "notches," or passages rent through the solid granite of the mountains, apparently by some violent convulsion of nature, there are five; the White Mountain Notch, two miles in length, and at its narrowest point only 22 feet wide, through which the Saco River passes; the Franconia Notch, which permits the passage of the Pemigewasset; the Pinkham Notch, through which a branch of the Saco and one of the Androscoggin find their way; and the Grafton and Dixville notches, through which flow the Androscoggin and one of its tributaries. The first two of these are those best known. "The Flume" at Franconia Notch is the most noted of those narrow waterways excavated through the rock, though there are others hardly inferior to it in attractiveness. Among the other objects of interest in the Franconia group is the "Old Man of the Mountain," a well defined profile of the human face formed by three projecting rocks. (See **FRANCONIA.**) At the base of the mountain lies a beautiful lakelet one fourth of a mile long and one eighth wide, called "Profile lake," or the "Old Man's Washbowl." Five miles south of the notch is the "Basin," a circular bowl-like cavity 45 feet in diameter and 28 in depth, produced by the whirling of large stones in a natural hollow in the rock by the current. It is filled with clear sparkling water, which flows down the mountains in a succession of beautiful clear cascades. The "Pool," in the same vicinity, is a natural well in the solid rock 60 feet in diameter and 100 feet deep, of which 40 feet is water. The White Mountains were first visited by a white man, Darby Field of Pascataquac, in 1642, when with two Indians he ascended Mount Washington. Later in the same year Thomas Gorges and companions traveled up the Saco and explored the mountains and the plateau, and discovered the sources of the Saco, Connecticut, Androscoggin, and Kennebec rivers. The White Mountains are a famous summer resort. Several railroads enter the mountains, and in the seasons special trains carry passengers direct from many of the large cities.

White Oak Swamp, Battle of. See **GLENDALE, BATTLE OF.**

White Plains, N. Y., village, county-seat of Westchester County; on the Harlem Division of the New York Central & Hudson River Railroad; about 20 miles from the central part of New York city. It is in an agricultural section, and has several manufactories. It has a high school, opened in 1894, graded elementary public and parish schools, Saint John's Academy for

WHITE QUAKERS—WHITE SULPHUR SPRINGS

Boys, Good Counsel Training School, several private schools, and a public library. Bloomingdale Asylum for the Insane occupies a prominent position overlooking the village. The village owns and operates the water-works. The government is vested in a president and board of trustees. Pop. (1890) 4,042; (1900) 7,899.

White Plains and vicinity were the scenes of many battles and skirmishes during the Revolution. Fortifications or their ruins were to be seen on all sides. On 21 October Washington established his headquarters at White Plains. On the evening of 27 October Haslett with about 1,600 American troops had taken possession of Chatterton Hill, a commanding eminence on the west side of the Bronx; and on the morning of the 28th, reinforced by a small additional force under McDougall and two pieces of cannon under command of Alexander Hamilton, he fortified his position as well as time would allow. On the morning of that day Howe advanced with his forces in two columns (numbering about 13,000 men) upon the American army posted along the Bronx. Perceiving the importance of the position on Chatterton Hill, and regarding it as the only assailable point of the American army, Leslie was sent with a strong detachment to cross the Bronx and attack it in front, while Rall with a Hessian regiment was ordered to cross the river a quarter of a mile below and attack Haslett in flank. The hill was carried with great difficulty, the Americans retreating in good order and without being pursued. The British troops rested that night on Chatterton Hill. The next day, 29 October, a skirmish took place between the two armies; but Howe, finding the Americans still too strongly posted to be attacked with safety, waited for re-enforcements. These arrived on the evening of the 30th, but a storm coming on, the Americans took advantage of it and withdrew to the still stronger position of Newcastle, two miles above, which they had previously fortified. Afraid to attack them in this position, Howe fell back to the junction of the Harlem and Hudson rivers, and encamped on Fordham Heights; and Washington withdrew his army leisurely into New Jersey and made his headquarters at Hackensack. The loss of the Americans in the battle of White Plains and the skirmish of the succeeding day was nearly 300 in killed, wounded, and prisoners, and that of the British about the same.

White Quakers, a small community of Quakers in Dublin, Ireland, so-called from dressing in white. They are seceders from the main body, and are said to be Antinomian in their belief.

White Ribbon Gospel Army, a Christian society which originated in England in 1884, and has since extended to the United States. It gives special attention to inculcating moral purity.

White River, in Arkansas, has its rise in the Ozark Mountains, in the northwestern part of the State, flows northeast into Missouri, forming a large curve, and entering Arkansas again in Marion County, then flows southeast to the Mississippi River. It enters the Mississippi through several channels, some of which pass through the mouth-channels of the Arkansas River. Except in the highlands of the

Ozark Mountains, the greater part of the course of the river is through marshy forest land. It is navigable to Batesville, about 380 miles. The total length is 800 miles.

White River, in Indiana, the chief branch of the Wabash in the State, is formed by the confluence, in Pike County, of the East and West Fork, which have their rise near the eastern boundary of the State. From the junction of the two forks to the mouth of the White, where it enters the Wabash, is 50 miles; total length from the source of the West Fork is 350 miles. The river is navigable to Martinsville on the West Fork and to Rockford on the East Fork.

White River Junction, Vt., village in Windsor County; on the Connecticut River at the mouth of the White River, and on the Central V., the Boston & M., and the Woodstock R.R.'s; about 65 miles south by east of Montpelier and 14 miles east by north of Woodstock. It is a commercial centre for a large agricultural region in both Vermont and New Hampshire. The National bank has a capital of \$100,000 and (1903) deposits amounting to \$1,283,580; the savings bank has deposits amounting to \$481,150. White River Junction is in the town of Hartford, and the Government Census does not give the population of the village separate. Pop. of town (1890) 3,740; (1900) 3,817.

White Sage. See EUROTIA; GOOSEFOOT.

White Sea, Northern Russia, a large gulf opening into the government of Archangel, between the Kola peninsula on the west and the Kanin peninsula on the east. Near its mouth, and on the eastern side, is a branch of it called the Gulf of Mezen, which receives the waters of the river Mezen, and the inner part of the sea sends off three large arms, namely, the Gulf of Kandalak, penetrating northwest into Lapland, the Gulf of Onega, receiving the river Onega, and the Gulf of Archangel, into which flows the Northern Dvina. Of the islands in the sea Solovetskii is the largest. The White Sea is comparatively shallow, and is frozen over from October to May. Archangel, at the mouth of the Northern Dvina, is the leading port of northern Russia, and other ports on the shores of the sea are Onega and Kem. Canals connect the White Sea basin with the basins of the Caspian, Baltic, and Black Sea.

White Sulphur Springs, Mont., city, county-seat of Meagher County; about 65 miles east by south of Helena. It is reached by stage from the Northern Pacific Railroad, a distance of about 40 miles. It is the commercial centre of a large agricultural, stock-raising, and mining region, and is noted for its thermal springs. The National bank has a capital of \$100,000. Pop. (1900) 446, which includes only those within the limits and not the number who transact business in the city.

White Sulphur Springs, W. Va., a district in Greenbrier County; on the Chesapeake & Ohio Railroad; about 230 miles west by north of Richmond and 90 miles west of Staunton. The locality has long been noted for its medicinal springs. The temperature of the water is 62° F. It is a famous health-resort. Pop. (1900) 1,625.

WHITE-SWELLING — WHITEFISHES

White-swelling, any severe disease of the joints resulting from chronic inflammation in the bones, cartilages, or membranes. The knee, ankle, wrist, and elbow are the joints most subject to this form of disease. It is distinguished from simple inflammation of the synovial membrane (synovitis) by the fact that the synovial membrane passes into pulpy degeneration. Amputation is frequently necessary. The disease may be local or constitutional in origin, being in the latter case due to rheumatism, gout, syphilis, pyæmia, etc.

White Whale. See **WHALE**.

Whitebait, the young fry of herring, the sprat and other small marine fishes, 2 to 4 inches long, caught in England as a delicate food. Whitebait, so much celebrated as figuring in the list of dainties of London epicures, has given rise to a great deal of controversy, but it is no longer considered a separate kind of fish, peculiar to the Thames. Its fame was no doubt attained, not so much from the simple quality of its flesh, as from the modes in which it was cooked at Greenwich: and doubtless the fact that it formed a feature in the annual dinner of her majesty's ministers at Greenwich also tended to enhance its reputation. Epicures advise its being cooked as soon as caught. Whitebait are sold in London in June and July.

Whitechap'el, London, England, a parish and parliamentary district, east of the nucleate city of London, one of the poorest portions of the metropolis, and formerly notorious for its criminal population. From 1888 to 1891 it was the scene of the atrocities of the mysterious Jack the Ripper. Within its boundaries are the Tower of London, and London Hospital, and it is intersected by Whitechapel Road. The name is derived from a former mediæval chapel, whence all distances east of London were calculated. Pop. (1900) 78,758.

Whitefield, hwit'fēld, **George**, English evangelist, founder of the Calvinist Methodists: b. Gloucester 16 Dec. 1714; d. Newburyport, Mass., 30 Sept. 1770. He was sent to the grammar school of Saint Mary de Crypt at Gloucester, and at 18 entered as servitor at Pembroke College, Oxford, where he became acquainted with the Wesleys, and joined the small society which procured them the name of Methodists. Hearing of his devotional tendencies, Dr. Benson, bishop of Gloucester, made him an offer of ordination at 21, which he accepted; and he was ordained a deacon in 1736. Such was his powerful and exciting preaching, that, after his first sermon at Gloucester, a complaint was made to the bishop that he had driven several people mad; on which the prelate observed that he hoped the madness would not be forgotten before the next Sunday. He for some time supplied a curacy at Dummer, in Hampshire but the next account sent him by the Wesleys of their progress in Georgia excited in him a desire to assist in their labors, and he arrived at Savannah in May 1737. Observing the deplorable want of education in the colony, he projected an orphan-house, for which he determined to raise contributions in England, where he arrived in the beginning of 1739. Although discouraged by many of the clergy, Bishop Benson did not scruple to confer on him priest's orders; and on going to London the churches in which he preached were incap-

ble of holding the crowds assembled to hear him. He now adopted the practice of preaching in the open air, which he seems first to have carried out at Kingswood, near Bristol, among the colliers, on whom his discourses produced a surprising effect, and whose vicious manners and habits he visibly improved. He afterward preached in the open air in Bristol, and in Moorfields, Kennington, and other places in the neighborhood of London, to vast assemblages of people. In August 1739, he again embarked for America, and made a tour through several of the provinces, where he preached to immense audiences, with an effect vividly portrayed in the autobiography of Benjamin Franklin. He arrived at Savannah in January 1740, where he laid the foundation of the orphan-house, and after making another extensive tour, returned to England, in March 1741. During his absence his cause had been declining at home, and the differences between him and Wesley on the doctrines of election and reprobation deprived him of many followers. After visiting many parts of England, Scotland, and Wales, where he married in 1741, he again returned to America (1744), and remained there nearly four years. His preaching met with great opposition in New England at this time and Harvard College put forth a "testimony" against him. Returning to England in July 1748 he was soon after introduced to the Countess of Huntingdon, who made him one of her chaplains. A visit to Ireland and two more voyages to America followed, and for several years his labors were unremitting. He preached at Exeter, N. H., the day before his death, and also at Newburyport. He is buried beneath the pulpit of the Federal Street Church at Newburyport. His works were published in 1771-2. Consult Gillies, 'Memoirs' (1772); Gledstone, 'Life and Travels of Whitefield' (1871); Tyerman, 'Life of Whitefield' (1876-7).

Whitefishes, a name given in the United States to various species of salmonoid fishes of the genus *Coregonus* and sometimes to those of *Argyrosomus*, more properly designated ciscoes. *Coregonus* has a comparatively small and rarely toothless mouth, the premaxillary bones broad and with the edge nearly vertical, and the lower jaw short. The thin cycloid scales are much larger than in the salmon and trouts, and the caudal fin is deeply forked. Internally, the stomach is horse-shoe shaped and provided with very numerous pyloric caeca, and the swim-bladder is very large. The species, about 15 in number, though some ichthyologists recognize many more, are confined to the clear lakes of the northern portions of the northern hemisphere often extending into the Arctic regions and sometimes there becoming anadromous. Wherever found they are highly valued for food. North America has about eight species. The common whitefish (*C. clupeiformis*) has its centre of distribution in the Great Lakes, but extends into the various lake systems of New York and southern Canada. It reaches a length of two feet and may be distinguished from the related species by its numerous and long gill-rakers, the toothless tongue and the elevated but not compressed back. As generally in the whitefishes, the color is olivaceous above and white below. It receives various local names from the fishermen, such as buffalo-back; and the variety landlocked in Otsego Lake at the

WHITEHALL

head of the Susquehanna River is known as the Otsego bass. During the greater part of the year the whitefish remains in the deeper waters of the lakes, moving about in schools which change their feeding grounds with considerable regularity. Being toothless they feed only upon small animals, such as crustaceans, snails and insect larvæ, the first being by far the most important part of their diet. During the late fall and early winter the schools congregate on the shallows to spawn; in the act of spawning the female rises to the surface and is immediately followed by a male which mingles the sperm with the stream of eggs issuing from her vent. The eggs are about one eighth of an inch in diameter and sink to the bottom, where most of them are eaten by the small fishes and mud-puppies which swarm on the spawning grounds. They develop slowly and require several weeks to hatch, the exact time depending upon the temperature of the water. Each female produces from 10,000 to 75,000 eggs, depending upon her size.

Besides the enemies affecting the eggs and young the adult whitefish are preyed upon by the large pike and lake-trout which follow the schools, and to a less extent by smaller predaceous fishes. The extensive development of the fisheries, which are prosecuted most vigorously at the very season when the spawning fish are most accessible on the shallows, has so depleted the numbers of the whitefish that the fisheries are now dependent upon artificial propagation for their maintenance. The methods are essentially the same as those employed in the artificial propagation of the shad, though many modifications in detail have been found necessary. Hundreds of millions of eggs are now annually taken and hatched under the auspices of the United States and State commissions of fisheries. Such extensive and even greater operations are required to bring these fisheries back to their former importance; for the catch in all of the Great Lakes has steadily fallen from 21,463,900 pounds in 1880 to 12,401,335 pounds in 1890 and 5,094,014 pounds in 1899. The value of the latter was \$297,023. But as the common whitefish has decreased in abundance, other and less esteemed species have assumed an increasing importance so that if the catch of all these in 1890 be taken into consideration the total becomes 78,640,364 pounds, valued at \$1,280,852. Of this 59,913,576 pounds, valued at \$941,067 were lake herring or cisco (*Argyrasomus artedii*). These figures represent the American catch alone and during the same year the Canadian fisheries probably yielded about 40,000,000 pounds more. Whitefish are sold fresh or are frozen immediately after capture and placed in cold storage at a temperature several degrees below freezing and in this condition shipped, especially during the winter, to all parts of the country. Relatively small quantities are also pickled or smoked.

Other species of *Coregonus* are found in the Great Lakes as well as in other lakes particularly northward and westward, but at the present time none are so highly valued as the common whitefish. An important one is the shad-wailer or round whitefish (*C. quadrilateralis*). The genus *Argyrasomus*, however, includes two species of great and increasing importance though inferior in quality to the common whitefish. The genus differs from *Coregonus* chiefly in the projecting lower jaw, larger mouth and

horizontal premaxillary bones. The numerous species are similarly distributed in North America, which has 8, Europe and Asia, and except for their great activity predatory mode of life their habits in general resemble those of the true whitefishes. The cisco whiting or lake herring (*A. artedii*) is about a foot long, bluish or greenish above, with dark, speckled silvery sides. It abounds in shallow waters of the Great Lakes and, as indicated above, is of great commercial value. The moon-eye cisco (*A. hoyi*) has a very large eye and the sides are brilliantly silvery. It is about a foot long and is the object of a considerable fishery in the western part of Lake Michigan. It spawns in November in relatively deep water. A third important species of this genus is the blue-fin whitefish (*A. nigripinnis*), distinguished from all of the preceding which have pale fins by the blue-black color of its pectorals, anals and ventral. It attains a length of 18 inches and is plentiful in the deep waters of Lake Michigan and the small lakes of Minnesota and Wisconsin.

Whitefishes seldom take the hook, but are captured by means of pound, trap, and gill nets and to a smaller extent with seines. The pound and trap nets are arranged in lines which sometimes reach to a distance of 10 or 12 miles from shore, while the gill nets are set much farther out in deep water and are weighted to the bottom.

Consult Brown Goode, 'Natural History of Aquatic Animals,' (Washington 1884) and Townsend, 'Statistics of the Fisheries of the Great Lakes,' Report U. S. Fish Com. for 1901.

Whitehall, London, England, a street leading from Parliament Square to Trafalgar Square, containing several public offices, and named after a palace that once stood here. The building known as the Horse Guards, the office of the commander-in-chief of the army, is so called in consequence of being the station where that part of the troops usually do duty. The treasury, near the Horse Guards, is built on the site of part of the old palace; the First Lord of the Treasury, however, has his official residence in Downing Street, where also the cabinet meets. The Admiralty Office contains the offices connected with the administration of the naval affairs of the country. The original Whitehall succeeded a mansion built by Hubert de Burgh before the middle of the 13th century. It afterward came into the possession of the archbishops of York, was inhabited by Wolsey (under the name of York Place), then passed to Henry VIII., and was called Whitehall. Charles I. was executed in front of Whitehall, and he was led to the scaffold out of one of the windows. Oliver Cromwell died in Whitehall. In 1697 the building was destroyed by fire, except the banqueting hall, which had been added by James I., according to a design of Inigo Jones, in 1619. This portion still remains, and chiefly consists of one room, of an oblong form and 40 feet high. The ceiling, representing the apotheosis of James I., was painted by Rubens, and was retouched by Cipriani. This building was long a royal chapel, but it now contains the museum of the Royal United Service Institution.

Whitehall, Ill., city in Greene County; on the Chicago & A., and the Chicago, B. & Q.

WHITEHALL — WHITELOCKE

R.R.'s; about 25 miles southwest of Jacksonville and 63 miles north of Saint Louis. It is in an agricultural and stock-raising region, and in the vicinity are deposits of fire clay. The chief manufactures are flour, sewer-pipe, tiles, stoneware, and machinery. Its shipping trade is chiefly in farm and dairy products, live-stock and clay products. There are six churches, a high school, and library. The two banks have a combined capital of \$100,000. Pop. (1890) 1,901; (1900) 2,030.

Whitehall, N. Y., village in Washington County; on Lake Champlain, Poultney River, the Champlain Canal, and the Delaware and Hudson Railroad; about 75 miles north by east of Albany. It is at the foot of Skene's Mountain, in a narrow valley. It has railroad shops, silk and knitting mills, grist mills, lumber mills, and machine shops. It has a high school and a library. The bank has a capital of \$50,000 and deposits (1903) of nearly \$700,000. The village owns and operates the water-works. The government is vested in a board of trustees and a president chosen annually by popular vote.

In 1761 Whitehall was settled by Major Philip Skene and a colony of about 30 families; in November 1763 it was incorporated. When differences arose between America and England, which culminated in the Revolution, Skene joined the British and the Americans took possession of his property. An American garrison was stationed at Whitehall in 1776; but fearing capture by Burgoyne, they destroyed the fort, and the houses, and abandoned the place. At the close of the war nearly all the people returned and claimed their former holdings. The whole of the Skene property was sold at auction, and the highest bidder gave £11 10s. In 1812, when the Lake Champlain towns and villages were again near the centre of danger, a fort and block house was built. In 1819 the Champlain Canal was built from Whitehall to Fort Edward, and five years later it was extended to Troy. Pop. (1890) 4,434; (1900) 4,377.

White'ha'ven, England, a seaport and important coal-mining centre in Cumberland, situated on a bay of the Irish Sea, 40 miles southwest of Carlisle. It is well built, and has a townhall, custom-house, market-house, public library, public baths, with swimming-pond; a theatre, etc., a good harbor and a deepwater floating-dock. There is a considerable shipping trade, coals, iron-ore, pig-iron, steel rails, etc., being exported and American and other produce imported. The manufactures comprise sail-cloth, cordage, anchors, nails, cement, alabaster, earthenware, candles, and soap. Iron ship-building also is carried on, and there are blast-furnaces, iron- and brass-foundries, engineering works, flour- and saw-mills, breweries, a tan nery, etc. There are here extensive coal and iron mines, in which a large number of the inhabitants are employed. The coal-mines, which have been worked since the 17th century, extend some miles under the sea, and coal is wrought beneath the town. Pop. (1901) 19,325.

White'head, Charles, English poet: b. London 1804; d. Melbourne, Australia, 5 July 1862. He was engaged in a London mercantile house until 1857 when he went to Australia and entered journalism. He was the author of numerous poems, plays, and sketches, among

which are: 'The Solitary' (1831); 'The Autobiography of Jack Ketch' (1834); 'The Cavalier,' drama (1836); 'Richard Savage' (1842) subsequently dramatized; 'Smiles and Tears, or the Romance of Life' (3 vols. 1847); 'Life and Times of Sir Walter Raleigh' (1854); etc. Consult Mackenzie Bell, 'Charles Whitehead, a Forgotten Genius' (1884).

Whitehead, Cortlandt, American Protestant Episcopal bishop: b. New York 30 Oct. 1842. He was graduated from Yale in 1863 and from the Philadelphia Divinity School in 1867. Ordained to the priesthood in 1868 he was engaged in pastoral work in Colorado for three years and was rector of the Church of the Nativity, South Bethlehem, Pa., 1870-82. In January 1882, he was consecrated bishop of Pittsburgh.

Whitehead, William, English poet: b. Cambridge 1715; d. London 14 April 1785. He was educated at Winchester and Clare Hall, Cambridge, was appointed secretary and registrar of the order of the Bath in 1755, and in 1757 was appointed poet-laureate, in succession to Colley Cibber (q.v.). His identity is frequently confused with that of the satirist Paul Whitehead. He was the author of the tragedies: 'The Roman Father' (1750); and 'Creusa, Queen of Athens' (1754); the comedy 'The School for Lovers' (1762); a farce 'The Trip to Scotland' (1770); and numerous minor poems. His collected works were edited and published with a memoir by William Mason (1788).

Whitehouse, Henry Remsen, American diplomat: b. New York 17 Aug. 1857. He was educated in the United States and in Europe, was engaged in the United States diplomatic service in 1882-96, and has written: 'Sacrifice of a Throne' (1897); 'Collapse of the Kingdom of Naples' (1899-1902); etc.

White'ing, Richard, English journalist and novelist: b. London 27 July 1840. He was educated privately and began his career in journalism in 1866 with a series of satirical sketches on social and political topics afterward republished as 'Mr. Sprouts—his Opinions' (1867). He was subsequently engaged on the *Morning Star* as leader-writer, and was afterward Paris correspondent for various New York, London, and Manchester papers, but returned to London to join the editorial staff of the London *Daily News*, a position he resigned in 1899. He has written: 'The Democracy' (1876); 'The Island' (1888); 'No. 5 John St.' (1899); 'The Life of Paris' (1900); 'The Yellow Van' (1903); etc.

Whitelocke, hwit'lök, Bulstrode, English statesman: b. London 2 Aug. 1605; d. Chilton Park, Wiltshire, 28 Jan. 1676. Educated at Oxford he studied law at the Middle Temple, was called to the bar in 1626, and entered Parliament as member for Stafford. He was elected to the Long Parliament of 1640 from Great Marlow, was chairman of the committee for drawing up Stafford's charges of impeachment, and one of the commissioners appointed to treat with the king at Oxford. As a member of the Westminster Assembly (1643) he opposed the adoption of Presbyterianism, and as a commissioner of the Great Seal (1649) withheld consent to the king's death. In 1623 he was

WHITESTONE — WHITING

ambassador to Sweden, where he concluded a treaty with Queen Christina, and on his return was speaker of the House of Commons (1656), and one of Cromwell's lords (1657). From his MSS. have been published 'Memorials of English Affairs from the Beginning of the Reign of Charles I. to the Restoration' (1682, new ed. 1852); 'Memorials of English Affairs from Brute to the End of the Reign of James I.' (1709); 'Journal of the Swedish Embassy' (1772, new ed. 1845), and other works.

White'stone, N. Y., in New York city, borough of Queens. The village was a place of importance, on account of its good harbor, and its position near the eastern entrance to New York Harbor. It is near the United States military post at Willett's Point, and Fort Schuyler, on Throgg's Neck. Pop. (1890) 2,808.

White'sthroat, a bird, either of two species of Old World warblers—*Curruca cinerea*, the greater, and *C. sylvicola*, the lesser whitethroat; or a hummingbird (*Leucochloris albicollis*) of Brazil; or a white-throated sparrow (*Zonotrichia albicollis*), commonly known in the eastern United States, where it is a migrant, as Peabody-bird.

Whitewash, a milky fluid produced by mixing good slaked lime with water. Used as a cheap coating for walls, fences, etc. When mixed with a little size and sometimes colored it is used on interior walls under the name of calcimine.

White'swater, Wis., city in Walworth County; on the Whitewater River, and on the Chicago, Milwaukee & Saint Paul Railroad; about 46 miles southeast of Madison and 50 miles southwest of Milwaukee. It is in an agricultural and stock-raising region and has creameries, paper mill, wagon works, sash and door factories, flour mill, machine shops, and furniture factory. It has a State normal school, a high school, opened in 1886, public and parish schools, and a public library. The two banks have a capital of \$150,000 and deposits amounting to \$1,118,740. Pop. (1890) 4,359; (1900) 3,405.

Whitewood. See LINDEN.

Whitfield, hwit'feld, or **Whitfield**, Henry, English clergyman: d. Winchester, England, about 1658. Of the date of his birth and his early life nothing is definitely known. He appears to have been appointed to the living of Ockley, Surrey, in 1616, but having protected several Puritan clergymen during the Laudian persecution incurred the displeasure of Laud, which was further increased by his refusal to read to his parishioners from the 'Book of Sports.' He therefore emigrated to New England in 1637 with many followers and was one of the founders of Guilford, Conn. In 1650 he returned to England and was minister at Winchester. His writings include: 'Some Helpes to Stirre up to Christian Duties' (3d ed. 1636); 'The Light Appearing more and more toward the Perfect Day, or a Farther Discovery of the Present State of the Indians of New England concerning the Progresse of the Gospel amongst them' (1641); and 'Strength out of Weakness' (1652).

Whitfield, Robert Parr, American geologist: b. New Hartford, N. Y., 27 May 1828. He

studied natural history and geology almost unaided, was assistant on the New York State geological survey in 1856-76, and in 1872 was attached to the United States Geological Survey. He was instructor in geology at the Rensselaer Polytechnic Institute in 1872-5, professor in 1875-8 and since 1887 has been curator of the American Museum of Natural History in New York.

Whit'gift, John, English prelate: b. Great Grimsby, Lincolnshire, about 1530; d. Lambeth 29 Feb. 1604. He was educated at Pembroke Hall, Cambridge, and after the accession of Elizabeth took holy orders (1560), and was made chaplain to Cox, bishop of Ely. In 1563 he was appointed Lady Margaret professor of divinity at Cambridge, in which office he gained a high reputation by his lectures on the book of Revelations and the Epistle to the Hebrews, and in 1567 was elected master of Pembroke Hall. Soon after the queen made him her chaplain and master of Trinity College, Cambridge, and the same year he also became regius professor of divinity. He was made dean of Lincoln in 1571, and in 1576 bishop of Worcester, and, being also vicepresident of the marches of Wales, made constant use of both the temporal and spiritual powers to put down Roman Catholicism and Puritanism within the limits of his jurisdiction. In 1583 he became archbishop of Canterbury, and soon exacted from every clergyman in the church a subscription to the three points of the queen's supremacy, the lawfulness of the common prayer and ordination service, and the truth of the whole 39 articles. Making use of the court of high commission he removed from positions in the church all non-conformists. In 1585 the star chamber, at his instigation passed ordinances for the regulation of the press, by which no one was allowed to print except in London, Oxford, and Cambridge; the number of printers was to be determined by the ecclesiastical commissioners; and none but a few special printers were to be suffered to print any book, matter, or thing whatsoever until it should be perused and allowed by the archbishop of Canterbury and the bishop of London; and every one selling books contrary to the intent of the ordinance was to be imprisoned for three months. In 1586 he was sworn of the privy council, and framed the statutes of cathedral churches. The hospital and grammar school at Croydon were founded by Whitgift. Consult Lives by Strype (1718) and by Sir George Paule (1612).

Whiting, hwit'ing, **Arthur Buttelle**, American musician: b. Cambridge, Mass., 20 June 1861. He is well known as a pianist and as a composer of orchestral and chamber music as well as of numerous songs and pianoforte pieces.

Whiting, George Elbridge, American musician and composer: b. Holliston, Mass., 14 Sept. 1842. He early displayed musical talent; and was engaged as an organist successively at Hartford, Conn., Boston, and at Albany. He studied in Europe in 1863 and in 1872, was organist at the Church of the Immaculate Conception, Boston, in 1876-78, and has occupied that position since 1883. In 1878-83 he was organist at the Cincinnati Music Hall and professor of organ and composition at the Cincinnati College of Music. He was engaged as a

WHITING—WHITLOCK

teacher in the New England Conservatory of Music for several years but resigned in 1897. His compositions include: 'Grand Sonata'; 'Tale of the Viking'; 'Dream Pictures, Cantata'; 'Midnight, Cantata'; a one-act opera in Italian, 'Lenora' (1893); and numerous preludes, symphonies, etc.

Whiting, Lilian, American author: b. Niagara Falls, N. Y., 3 Oct. 1857. She engaged in journalism in Saint Louis, Mo., in 1876, in 1880-90 was literary editor of the Boston 'Traveler' and was editor of the Boston 'Budget' in 1890-93. Her published books include: 'From Dreamland Sent,' verse; 'The World Beautiful' (3 vols., 1894-6-8); 'A Study of the Life and Poetry of Elizabeth Barrett Browning' (1899); 'Kate Field: a Record' (1899); 'The World Beautiful in Books' (1901); 'Boston Days' (1902); etc.

Whiting, Ind., town in Lake County; on Lake Michigan, and on the Pennsylvania Railroad; about 16 miles southeast of Chicago. It has a good harbor and steamer connections with the Lake Michigan ports. It has a large oil refinery, machine shops, and several industrial establishments connected with refining and shipping petroleum and with shipping farm products. In 1900 (government census) the manufacturing establishments, though small in number, were capitalized for \$12,701,598, and the value of the annual products was \$16,674,285. The two banks have a capital of \$100,000. Pop. (1890) 1,408; (1900) 3,983.

Whiting, a name applied to several quite unrelated fishes probably in allusion to the noteworthy whiteness of their flesh, or, in some cases, of the skin of the lower parts. In the United States, and more especially in the South, several species of *Menidia*, a genus of *Scianida*, are known as whiting, but more widely as kingfishes (q.v.). The common whiting (*M. americanus*) reaches a length of about a foot; the body is elongated and slender with a high spinous dorsal and a long low soft dorsal fin, an undulate caudal fin, and is completely covered with ctenoid scales; the outer row of teeth of the upper jaw are enlarged and strong and the color silvery gray with faint oblique dusky bars. It is very common along sandy shores of the entire Gulf coast and on the Atlantic coast northward to about the mouth of Chesapeake Bay and southward to Brazil. Though remaining on these coasts throughout the year they are most plentiful in summer when they frequent the bays and estuaries, but prefer strong currents and the deeper waters. They feed upon crabs, shrimps and other crustaceans and being vigorous biters and gamy fighters, afford splendid angling. Great numbers are caught on lines for the market and the flesh is unusually firm, delicate, and well-flavored. Spawning is said to occur in May. The surf whiting (*M. littoralis*) is so called because, unlike the last, it frequents shallow waters along sandy shores and is captured in large quantities by means of seines. The outer teeth of the upper jaw are not enlarged; the gill-rakers are better developed than in the common whiting; and the black tip of the caudal fin is another mark of distinction. The common northern kingfish (*M. saxatilis*) also extends into southern waters, and is there con-

fused with the above species under the name of whiting. It may be recognized by its dusky color and the distinct, dark bands which cross the sides obliquely. Other species occur on the Pacific coast. By the New England fisherman the name of whiting or silver hake is given to a common species of the cod family (*Gadida*), the *Merluccius bilinearis* of American ichthyologists, though many European authorities fail to distinguish it from the Old World *M. vulgaris*. From the great majority of the cods the whiting is distinguished by the total absence of a chin-barbel and by the peculiar excavated area of the top of the skull; the second dorsal and the anal fin are long and each divided nearly in two by a deep notch. The body is elongated and covered with small scales; the color grayish silvery white below. This whiting is common in waters of moderate depth along the shores of New England and somewhat northward, and extends southward in deep water to Virginia and even to the Bahamas. Unlike most of the *Gadida*, which are essentially bottom-feeders, it is an active, roving species, which comes to the surface to pursue and feed upon herring and other fishes. Sometimes large schools appear on our coasts and many are captured in purse-seines and pound-nets. Spawning takes place at the bottom on the edge of the continental slope. Owing to its comparatively small size and the softness of its flesh it is one of the least important economically of the family.

The European whiting (*M. vulgaris*) is scarcely distinguishable from ours, but has much smaller scales, fewer spines in the first dorsal fin and larger teeth. It frequents shallower water and is very abundant along the northern coasts of Europe. It makes its appearance in vast shoals, keeping at a short distance from the shore, and is taken by the line in great numbers. It is considered the most delicate and most wholesome of all the species of cod; but it does not attain a large size, usually not exceeding a foot in length and under 2 pounds in weight. The food of the adults consists chiefly of fishes and of the young of shrimps and other crustaceans. Spawning occurs in, and the young frequent, the shore waters. As long as the young feed chiefly on the bottom they retain a chin-barbel, but as their habits change this degenerates and finally disappears. Other fishes sometimes called whiting are the hog-fish, harvest-fish, and a whitefish (qq.v.)

Whiting, a preparation of white chalk from which the grosser impurities have been removed. It is extensively used in the arts.

Whiting-pout, or **Brassy**, a fish. See **BIB.**

Whitlock, hwit'lök, **Elizabeth Kemble**, English actress, fifth child of Roger Kemble (q.v.), b. Warrington, Lancashire, 2 April 1761; d. 27 Feb. 1836. She first appeared at Drury Lane theatre in February 1783, as Portia. In 1785 she was married to Charles Edward Whitlock, a provincial manager and actor, and seven years later accompanied her husband to this country, where they performed for many years in the principal cities. Mrs. Whitlock became the most popular actress of the day in America, and in Philadelphia frequently performed before President Washington and other distinguished persons. She returned to England in 1807 with a competency, and thenceforth retired from the

WHITMAN

stage. In personal appearance and voice she is said to have strongly resembled her sister, Mrs. Siddons.

Whitman, Charles Otis, American zoologist: b. Woodstock, Maine, 14 Dec. 1842. He was graduated from Bowdoin in 1868, studied at Leipsic, and in 1880-1 was professor of zoology at the Imperial University, Tokio, Japan. He was engaged in further studies at the Naples Zoological Station in 1882, and in 1883-5 was assistant in zoology at Harvard. He was director of the Allis Lake Laboratory, Milwaukee, in 1886-9, and in 1889-92 professor of zoology at Clark University, Worcester, Mass. He became director of the Marine Biological Laboratory at Woods Hole, Mass., upon its foundation in 1888, and since 1892 has been at the head of the department of zoology at the University of Chicago. He was elected to the National Academy of Sciences in 1895. He founded the *Journal of Morphology* in 1887, and since 1883 has been editor of the microscopical department of the *American Naturalist*. He has made a specialty of the development of the vertebrates and of the structure and development of worms. His writings include: *Methods of Research in Microscopical Anatomy and Embryology* (1885); *Biological Lectures* (1890-5); *The Inadequacy of the Cell Theory of Development* (1893); *Animal Behavior* (1898); etc.

Whitman, Marcus, American missionary and pioneer: b. Rushville, N. Y., 4 Sept. 1802; d. near Walla Walla, Or., 29 Nov. 1847. After studying medicine at the Berkshire Medical Institution, Pittsfield, Mass., he practised in Canada for four years. He offered his services as a missionary (1834) to the American Board of Commissioners for Foreign Missions, and in 1835 went with Samuel Parker to explore the region of the Oregon, but did not go beyond Green River. In 1836, having married, with his wife and three fellow missionaries he set out to work among the Indians of the upper Columbia. The party crossed the plains by wagon, being the first persons to reach the Pacific coast by this means. On 1 May they reached the Columbia River, and located themselves near the site of the present Walla Walla, Wash. They were soon followed by a large number of emigrants, who settled in what was then known as Oregon, and now forms the States of Oregon, Washington, and Idaho. At this time the Hudson Bay Company was using every possible means to secure this territory to the English. When this plan became evident to Whitman he decided to take every precaution to forestall it. The Ashburton Treaty was then before Congress, and was expected to settle the Oregon question. In 1842-3 Whitman traveled over 3,000 miles to the East on horseback, enduring all the hardships of a Western winter in the mountains, and according to the statement of H. H. Spalding, one of his missionary companions, he reached Washington (3 March 1843) only to find that the treaty had been signed, but that the Oregon question had not been included. Whitman, as Spalding's version represents, at once went to work to show the government the value of the land it had deemed worthless, demonstrated to the people the fertility of the soil of Oregon, and the fact that it could be reached by wagon, and then returned

at the head of a large body of emigrants. By his daring ride and earnest endeavors Whitman, in this view of the matter, won this great section for the United States, and the results of his work were secured by the treaty of 1846. This claim, however, has been the subject of much controversy, and to the satisfaction of some students has been disproved. Whatever its merits, there is no doubt that Whitman's ride (he reached Boston 30 March 1843) resulted in the reversal of the missionary board's purpose to discontinue the southern branch of the mission in which he was engaged; and his work and that of his companions has a historical relation to the American settlement of the Oregon country. Whitman, his wife, and 12 of their companions were massacred by the Cayuse Indians. Consult: Nixon, *Life of Marcus Whitman* (1895); Mowry, *Marcus Whitman* (1901); and Bourne, *Essays in Historical Criticism* (1901), in which the Whitman claims are examined and discredited. See OREGON; OREGON QUESTION, THE.

Whitman, Sarah Helen Power, American poet: b. Providence, R. I., 1803; d. there 27 June 1878. She was married to John W. Whitman, a Boston lawyer; was once engaged to Edgar Allan Poe, afterward writing a defense of him entitled *Edgar A. Poe and His Critics* (1860); contributed numerous critical articles and poems to periodicals, and was noted for her conversational powers. Her verse was in part collected in the volume *Hours of Life, and Other Poems* (1853), and fully in the posthumous *Poems* (1879). *Fairy Ballads* and some other works were written with her sister, Anna M. Power. Her finest poem, *A Still Day in Autumn*, has much melody and beauty of expression and retains an honored place in anthologies.

Whitman, Walt (originally WALTER), American poet: b. West Hills, Long Island, New York, 31 May 1819; d. Camden, N. J., 26 March 1892. He was educated in the public schools of Brooklyn, and learned the printer's trade, teaching also in several country schools in Long Island. For a brief period he edited several newspapers, until in 1847-8 he made an extensive pedestrian tour as a workman through the United States and Canada, subsequently employing himself as a carpenter and builder. His first and chief work, *Leaves of Grass*, was published by himself at New York in 1855. This thin volume of 94 pages was received, for the most part, with abuse, mainly because of its unconventional metrical style, and the freedom with which the poet dealt with moral and social subjects. During the American Civil War, Whitman's brother was wounded on the battlefield, and the poet, who hastened to his aid, remained afterward as a volunteer army nurse at Washington and in Virginia for the years 1862-5. One result of this experience was the small volume *Drum Taps* (1865), subsequently included with *Leaves of Grass*. After the war he held a government clerkship in Washington, but the fatigue and mental strain of his labors in the hospitals brought about a severe attack of paralysis in 1873. He was recovering from this when the sudden death of his mother in his presence caused a serious relapse. From this time he resided at Camden, N. J., remaining more or less of an invalid until

WHITMAN — WHITMAN COLLEGE

his death. During all these years Whitman continued to write with the old vigor and freedom of rhythm, but with less of the early crudeness of expression. Though Whitman, like Carlyle and Browning, may be a dangerous and dangerously easy model for imitation, he undoubtedly worked out for himself a style of distinction as notable as theirs. This in itself is a title to fame, or at least a charm against oblivion, even though his style, like that of Lyly, runs to extremes and vices. This style or form is a rhythmic recitative or irregular chant, precursors of which may be found in the English translation of the Psalms and other Biblical poems, in Macpherson's 'Ossian,' and in the later poems of William Blake. These chants vary in movement and seem governed by laws rhythmic rather than metric, which (like the grammar of an unwritten tongue) have never been formulated even by the inventor himself. They have a peculiar, wild, stirring charm, which is apt, for a time, to make regular verses seem tame and insipid after them. As to subject, Whitman set himself the Atlantean task of uplifting into the sphere or dominion of poetry the whole of modern life and man, omitting nothing, concealing nothing. His thesis is that of Saint Peter's vision: "There is nothing common or unclean." Hence the logical necessity with Whitman to include the treatment of subjects which in modern society are tabooed as obscene and unmentionable; hence, too, the accusations of indecency, so just and pertinent from the accuser's point of view, but so futile and irrelevant from that of the accused. Whitman is in fact an idealist who has bound himself by a solemn vow to be a thorough-going realist; and his resolute and often successful endeavor to secure this union gives his work its exceptional artistic quality. He is a prince of impressionists in literature. But so hard and high is the task that he sets himself that it is no matter of surprise that he sometimes, if not often, fails, and from heights where he was approaching the sublime falls nerilously near the ridiculous. This is the fate of all artists who strive for the highest things, that their failures—often only apparent—are more easily detected than their solid achievements; hence the contumely and ridicule that a Turner or a Wordsworth, Keats, or Shelley suffers at the hands of a clever but uninitiated criticism. So largely with Whitman; but it is better to approach him in the same spirit that he has shown toward man and nature, that of for ever seeking for what is great and good, while outfacing steadily and bravely every stern and refractory reality. Besides the two books already mentioned, he published 'Drum-Taps' (1865); 'Memoranda During the War' (1867); 'Democratic Vistas' (1870); 'Passage to India' (1870); 'After All, Not to Create Only' (1871); 'As Strong as a Bird on Pinions Free' (1872); 'Two Rivulets' (1873); 'Specimen Days and Collect' (1883); 'November Boughs' (1885); 'Sands at Seventy' (1888); and 'Good-bye, My Fancy' (1892).

The 'Conservator,' of Philadelphia, is the organ of Whitman study. Consult: 'Autobiographia,' selected from the poet's writings (1892); Burroughs, 'Whitman as Poet and Person' (1866); Bucke, authorized 'Life' (1883); Burroughs, 'Whitman: A Study' (1896);

O'Connor, 'The Good, Gray Poet' (1866); Dowden, 'Studies in Literature' (1878); Symonds, 'Essays, Speculative and Suggestive,' Vol. II. (1890).

Whitman, Mass., town in Plymouth County; on the New York, New Haven & Hartford R.R.; about 15 miles northwest of Plymouth and 20 miles south by east of Boston. The chief manufacturing establishments are boot and shoe factories, paper and wood box factories, tack and nail works, and steel shank factory. In 1900 (government census) Whitman had 65 manufacturing establishments which were capitalized for \$2,054,815, and in which were 2,161 employees to whom were paid annually \$1,192,401. The value of the annual finished products was \$5,009,786. It has seven churches, public schools, and a public library. There are two banks, one national and one savings bank. The government is administered by annual town meetings.

The town was originally a part of Abington, but was set off in 1875 and incorporated as South Abington. In 1886 the present name was adopted. Pop. (1890) 4,441; (1900) 6,155.

L. B. SLATCH,

Editor of 'Whitman Times.'

Whitman College, located at Walla Walla, Wash. It was founded by Cushing Ells as a memorial to Marcus Whitman (q.v.); it was chartered in 1859 as Whitman Seminary, but was not open to students till 1866; in 1882 the courses were extended, the standard raised, and a new charter obtained in 1883 by which the name was changed to Whitman College. For several years the college was aided by the American College and Education Society of Boston, in 1893 Dr. D. K. Pearsons of Chicago offered to give \$50,000 if the college would raise \$150,000 for the same purpose. The conditions were met, and in 1902 Dr. Pearsons added another \$50,000 to the endowment. Women are admitted on equal terms. The organization includes in addition to the College Department, the Conservatory of Music and the Academy. The college confers the degrees of bachelor of arts, bachelor of letters, bachelor of science, and bachelor of music. Certain studies, including Biblical literature, are required for all courses; Greek is required for the H.B. degree, French or German for the B.L. and B.S. degrees, and one year's work in theory of music, history of music, harmony, and counterpoint for the music degree. Each student by the end of the Freshman year must elect a major study in which three years' work must be done; the major for the B.S. degree must be in mathematics or a science. The rest of the required number of hours are free electives. Courses in pedagogy are included in the curriculum. Practical music work does not count toward a degree in the above mentioned courses; but in the Conservatory the degree of bachelor of music is conferred on students who hold a bachelor's degree and complete the regular music course. There are 20 scholarships, and one loan fund; students are also aided in securing employment. The students maintain Christian Associations, literary societies, and an oratorical association; glee clubs, athletic associations, and a general organization known as the "Associate Students"; the college is affiliated with the Inter-Collegiate Debating Association, and the Inter-

Eli Whitney

WHITMARSH — WHITNEY

Collegiate Athletic Association. The campus consists of 27 acres near the centre of the city and includes a small lake. The buildings include the Whitman Memorial, Billings Hall (men's dormitory), Reynolds Hall and Prentiss Hall (women's dormitories), Association Hall, the Conservatory, and the gymnasium; plans for a new gymnasium were under consideration in 1904. The library in 1904 contained 11,200 volumes; the students numbered 355, of whom 78 were in the College Department, and 162 in the Conservatory of Music.

Whitmarsh, Hubert Phelps, American journalist: b. Madoc, P. Q., 10 Aug. 1863. He was a druggist in New York and Boston in 1887-1900, and in the latter year became the representative of the 'Century' in Cuba. He subsequently went to the Philippines for the 'Outlook' and in 1900-01 was governor of Benguet, P. I., resigning in the last named year. He has published: 'The World's Rough Hand'; 'The Golden Talisman'; 'Mysterious Voyage of the Daphne'; 'The Young Pearl Divers'; etc.

Whitney, whi't'ni, Adeline Dutton Train, American author: b. Boston, Mass., 15 Sept. 1824. She was educated in Boston and was married to Seth D. Whitney of Milton, Mass., in 1843. Although a frequent contributor to different periodicals during her earlier years, her real literary career did not begin until 1859, and her best work was done in the two following decades. Her writings, which are chiefly for young people, are wholesome in tone and entertaining in style, and include, among many others: 'Footsteps on the Seas, a Poem' (1857); 'Boys at Chequasset' (1862); 'Faith Gartney's Girlhood,' which first brought her into general notice (1863); 'A Summer in Leslie Goldthwaite's Life' (1866); 'Patience Strong's Outings' (1868); 'Hitherto: A Story of Yesterdays' (1869); 'Real Folks' (1871); 'Pansies,' verse (1872); 'Sights and Insights' (1876); 'Bonnyborough' (1885); 'Bird Talk,' verse (1887); 'A Golden Gossip' (1890); 'Friendly Letters to Girl Friends' (1897); etc.

Whitney, Anne, American sculptor and poet: b. Watertown, Mass., September 1821. She contributed to magazines and newspapers considerable verse of high quality collected in 1859 in a volume of 'Poems.' In 1860 she began work as a professional sculptor, opening a studio at Watertown, whence, after four years of study abroad, it was transferred in 1872 to Boston. Among her works are the statue of Samuel Adams for the Capitol at Washington, a bronze replica of which stands in Adams square, Boston; one of Lief Erikson in Boston (replica in Milwaukee, Wis.); and many designs and studies, including 'Roma,' an enlarged copy of which was exhibited at the Columbian exposition.

Whitney, Asa, American inventor and manufacturer: b. Townsend, Mass., 1 Dec. 1791; d. Philadelphia 4 June 1874. As a boy he worked at the blacksmith's trade, also became a machinist, and afterward manufactured machinery in Vermont and at Brownsville, N. Y. In 1830 he was appointed master machinist of the Mohawk & Hudson railroad shops, and three years later became superintendent of the road. In 1839-41 he was a State canal commis-

sioner in New York, and in 1842 removed to Philadelphia, where he entered into partnership with Matthew Baldwin in the building of locomotives. In 1847 he perfected a process for annealing cast-iron carwheels, and began to manufacture them extensively. By his further improvements in carwheels, etc., he did much to increase the convenience and safety of railroad service, and travel. He left \$50,000 to the University of Pennsylvania to found a chair of dynamical engineering.

Whitney, Caspar, American journalist and author: b. Baltimore, Md., 2 Sept. 1861. He was graduated from Saint Mathew's College, California, spent several years in traveling and hunting, acting as correspondent for 'Harper's Weekly' during much of the time and writing on outdoor sports. He is now (1904) editor of 'Outing.' His writings include: 'A Sporting Pilgrimage'; 'On Snowshoes to the Barren Grounds'; 'Hawaiian America'; etc.

Whitney, Eli, American inventor: b. Westboro, Mass., 8 Dec. 1765; d. New Haven, Conn., 8 Jan. 1825. He was graduated at Yale in 1792; while there having paid his expenses partly by teaching, partly by mechanical labor. He went to Georgia as a teacher, but finding a patron in the widow of General Nathaniel Greene, of the Revolutionary army, he resided on her estate and studied law. The cotton culture at this period, especially that of the best kind, the green-seed cotton, was limited by the slow and difficult work of separating the cotton from the seed by hand. Whitney set to work to remedy this by inventing a machine, but worked under great disadvantages, for he had to make his own tools. Reports of his success prompted some lawless people to break into his workshop and steal his machine, and get others made before he could secure a patent. He, however, formed a partnership with one Miller in 1793, and went to Connecticut to manufacture cotton gins; but the lawsuits in defense of his rights carried off all his profits and \$50,000 voted him by the State of South Carolina. Finally in 1798 he got a government contract for the manufacture of firearms, and was the first to effect the division of labor by which each part was made separately. He made a fortune by this manufacture, carried out with ingenious machinery at Whitneyville, Conn.; while he received little credit for the perfection of the gin, one of the most important of the whole series of inventions connected with the cotton manufacture. See COTTON; COTTON-GINNING MACHINERY.

Whitney, Henry Howard, American military officer: b. Glen Hope, Pa., 25 Dec. 1806. He was graduated from West Point in 1822, and was on special duty at the War Department in 1806-8. In the last named year, under orders from the secretary of war, he disguised himself as an English sailor, communicated with General Gomez, and made a military reconnaissance of the island of Porto Rico, thereby gaining the information upon which General Miles based the campaign on that island. He was captain of volunteers in 1898-9, served through the Spanish War as captain and assistant adjutant-general on the staff of General Miles, and in 1899 was appointed lieutenant. He accompanied General Miles in his tour around the world in 1902-03.

Whitney, Josiah Dwight, American geologist, brother of W. D. Whitney (q.v.): b.

WHITNEY — WHITSIDE

Northampton, Mass., 23 Nov. 1819; d. Lake Sunapee, N. H., 18 Aug. 1896. He was graduated at Yale in 1839, and spent the years 1842-7 in study in Europe, and then explored, with J. W. Foster, the Lake Superior region. Their 'Synopsis' of the explorations was published in 1849 and their 'Report' on the geology 1850-1. He was appointed State chemist and professor in the Iowa State University in 1855 and State geologist of California in 1860. He labored on the survey of that State till 1874, publishing his 'Geological Survey of California' (1864-70). In 1865 he was appointed to the chair of geology at Harvard. Among his publications not already named are: 'The Metallic Wealth of the United States' (1854); 'Yosemite Guidebook' (1869); 'Contributions to American Geology' (1880); 'Studies in Geographical and Topographical Nomenclature' (1888). The highest peak of the Sierra Nevada was named Mount Whitney in his honor.

Whitney, William Collins, American capitalist and politician: b. Conway, Mass., 15 July 1841; d. New York 2 Feb. 1904. He was graduated at Yale in 1863, and at the Harvard Law School in 1865; studied law with Abraham R. Lawrence in New York, and was admitted to the bar in that city. He took an active part in the organization of the Young Men's Democratic Club, and in the proceedings against the "Tweed Ring"; served as corporation counsel of the city in 1875-82, thoroughly reorganizing the Law Department; and was secretary of the navy in the Cabinet of President Cleveland from 1885 to 1889. In this position he accomplished much in the development of plans for strengthening the naval service, and the "new navy" owes its subsequent increase in considerable part to his progressive policy. He did effective work for the election of Grover Cleveland as governor of New York in 1882, and as President in 1884, and again in 1892, when he was manager of the Democratic campaign. He, however, declined to enter the Cabinet again, preferring to pursue his business career, in which his interests had grown to great proportions. One of his largest enterprises was that which resulted in the consolidation of the various street railway lines in New York city. The Metropolitan Street Railway system was mainly organized by him, and he was a director in many corporations and societies. He was also a man of recreations, was especially interested in the breeding and training of horses, and became the recognized leader of the American turf, for the elevation of which to higher levels of sportsmanship he successfully strove. At the time of his death he was one of the largest landowners in the East, his holdings being in several States, and including a game preserve of 16,000 acres in the Adirondacks. While his main residence was in New York, he also maintained others on his various estates, North and South, as well as a house in London.

Whitney, William Dwight, American philologist, brother of J. D. Whitney (q.v.): b. Northampton, Mass., 9 Feb. 1827; d. New Haven 9 June 1894. He was graduated from Williams College in 1845, studied at Yale in 1849-50, and then went to Germany, where he continued his philological and Sanskrit studies under Bopp at Berlin and Roth at Tübingen. He was appointed to the professorship of San-

skrit at Yale in 1854, and in 1870 he received in addition the chair of comparative philology, posts which he retained till his death. In 1856 he published, with Roth, an edition of the Atharva-Veda Sanhita, and in 1862 issued at New Haven an edition, with translation and notes, of the 'Atharva-Veda Prātiçākhyā.' His 'Language and the Study of Language' (1867) was an admirable exposition of the main principles of comparative philology. His other published works include: 'A Compendious German Grammar' (1869); 'A German Reader' (1869); an edition of the 'Taittiriya-Prātiçākhyā' (1872), for which he was awarded the Bopp medal of the Berlin Academy; 'Oriental and Linguistic Studies' (1872); 'The Life and Growth of Language' (1875); 'Essentials of English Grammar' (1877); 'A Sanskrit Grammar' (1879); 'The Roots, Verb Forms, and Primary Derivatives of the Sanskrit Language' (1885), a supplement to the grammar; 'A Practical French Grammar' (1886); etc. He was a contributor to Bohtlingk and Roth's great 'Sanskrit Dictionary' (1853-75) and editor-in-chief of 'The Century Dictionary of the English Language' (1889-91). He was elected a member of the American Oriental Society in 1850 and wrote more than half of the contents of Vols. 6-12 of the 'Journal' of that society. For a complete bibliography of his work, consult the 10th volume of the 'Journal of the American Oriental Society' (1897).

Whitney, Mount, a peak of the Sierra Nevada, in the southeastern part of California; altitude, 14,522 feet. It is the highest elevation in the United States, outside of Alaska. On the east side the slope is precipitous, rising abruptly from Owens Valley about 11,000 feet. In 1881 Professor S. P. Langley remained for some time on the summit, making daily observations on the solar heat.

Whitneyite, a metallic mineral, containing 88.4 per cent of copper and 11.6 per cent of arsenic and having the formula $Cu_{10}As$. It is known only massive, its structure being very fine-granular. It is malleable, has a hardness of 3.5 and specific gravity of about 8.5. Its color is pale reddish-white, tarnishing quickly to a bronze or nearly black. It has been regarded as a rare mineral until the recent discovery of large quantities associated with domykite in the Mohawk mine, Michigan, where it is now a valuable ore of copper.

Whiton, hwi'tōn, James Morris, American Congregational clergyman: b. Boston, Mass., 11 April 1833. He was graduated from Yale in 1853, and in 1854-64 was rector of Hopkins Grammar School, New Haven, Conn. He was principal of Williston Seminary, East Hampton, Mass., in 1876-8, and subsequently was in charge of Congregational churches in Lynn, Mass., Newark, N. J., New York, and Haworth, N. J. Since 1896 he has been a member of the editorial staff of the 'Outlook.' He has published several volumes of sermons, text-books, an edition of selected orations from Lysias (1875), and 'Is "Eternal" Punishment Endless?' (1876); 'Gloria Patria' (1892); 'Miracles and Supernatural Religion' (1903); etc.

Whitside, hwi'sīd, Samuel Marmaduke, American military officer: b. Toronto, Canada, 9 Jan. 1839. He entered the United States army

WHITSITT — WHITTIER

in 1858; served through the Civil War, was brevetted major in 1865 and in 1866 was appointed captain. He was afterward engaged for more than 25 years in the Indian wars on the Western frontier, where he captured Big Foot and his 400 Sioux warriors in December 1890; and commanded his regiment at the battle of Wounded Knee on the following day. He was promoted lieutenant-colonel in 1895; was in command of the 5th United States cavalry during the Spanish-American War, and was placed at the head of the Department of Santiago and Puerto Principe, Cuba, in January 1900. He was promoted brigadier-general of volunteers in 1901, receiving that rank in the regular army in 1902, and in the same year was retired from active service.

Whitsitt, hwīt'sīt, **William Heth**, American Baptist clergyman and educator: b. Nashville, Tenn., 25 Nov. 1841. He was graduated from Union University, Murfreesboro, Tenn., in 1861, served in the Confederate army 1862-5, and was pastor of Mill Creek church, Nashville, 1865-6. He subsequently studied at the University of Virginia, the Southern Baptist Theological Seminary, Louisville, Ky., and at Leipzig, and became pastor of a Baptist church in Albany, Ga., in 1872. He was professor in the Southern Baptist Theological Seminary 1872-95, president of that institution 1895-9, and has been professor of philosophy at Richmond College, Va., from 1901. He has published: 'History of the Origin of Infant Baptism'; 'Origin of the Disciples of Christ'; 'A Question in Baptist History' (1897).

Whitson, John Harvey, American novelist: b. Seymour, Ind., 28 Dec. 1854. He was admitted to the Indiana bar in 1876, but after practising his profession for a time turned to journalism. He now (1904) resides in Somerville, Mass. He has published: 'The Young Ditch Rider and Other Stories' (1899); 'Barbara, a Woman of the West' (1903); 'With Fremont the Pathfinder' (1903); 'The Rainbow Chasers' (1904).

Whitsunday, the seventh Sunday after Easter; a religious festival in commemoration of the descent of the Holy Spirit on the day of Pentecost. The name was derived from the white garments worn on that day by candidates for ordination and children presented for baptism. The older name was Pentecost. See **PENTECOST**.

Whittemore, hwīt'ē-mōr, **Amos**, American inventor: b. Cambridge, Mass., 19 April 1759; d. West Cambridge (now Arlington), Mass., April 1828. He worked for some years as a gunsmith, and finally formed a copartnership with one of his brothers and several other persons for the manufacture of cotton and wool cards. He had not been long engaged in this business before he invented a machine for puncturing the leather and setting the wires, a work previously performed by hand. In experimenting for this invention he met with great difficulty in bending the wires to a given angle after they were finally fastened in the leather, and was on the point of giving up the attempt when in a dream he discovered a method of effecting it. The invention was patented in the United States in 1797, and Whittemore went to England to secure his rights there, but was unsuccessful.

In the United States the patent was sold for \$150,000; but afterward his brother Samuel Whittemore repurchased it, and carried on the business. Amos Whittemore devoted his last years to the invention of an orrery, in which every planet was to describe its own orbit, but did not live to complete it.

Whittemore, Thomas, American Universalist clergyman: b. Boston 1 Jan. 1800; d. Cambridge, Mass., 21 March 1861. He studied for the ministry under the Rev. Hosea Ballou, in April 1821; was settled as the Universalist minister at Milford, Mass., and the next year removed to a church in Cambridgeport, Mass. He resigned in 1833 but resided in Cambridge for the remainder of his life. Early in his ministry he was joint editor of the 'Universalist Magazine,' and in 1828 commenced the publication of the 'Trumpet,' a Universalist newspaper in Boston, of which he was sole editor and proprietor for nearly 30 years. He was also president of the Cambridge bank and of the Vermont and Massachusetts railroad, and represented Cambridge repeatedly in the State legislature. He published: 'A History of Universalism' (1830, enlarged 1860); 'Notes and Illustrations of the Parables' (1832); 'Songs of Zion' (1836); 'Plain Guide to Universalism' (1839); 'Life of Hosea Ballou' (1854-5); etc. Consult his 'Autobiography' (1859).

Whittier, hwīt'ī-ēr, **John Greenleaf**, American poet: b. Haverhill, Mass., 17 Dec. 1807; d. Hampton Falls, N. H., 7 Sept. 1892. A Quaker, he labored in boyhood on the farm made celebrated by 'Snowbound,' and received but little formal education, though he contrived by working at shoemaking and teaching to pay for two periods of six months at Haverhill Academy in 1827-8. The acceptance of a poem from him in 1826 for the Newburyport 'Free Press' led to a lifelong friendship with its editor, William Lloyd Garrison (q.v.). He edited the 'American Manufacturer,' a weekly concerned chiefly with mechanics, the industries, and agriculture, in Boston in 1829, and in the following year the 'Haverhill Gazette.' During 1830-2 he conducted the 'New England Review,' which G. D. Prentice (q.v.) had brought into some prominence, at Hartford, Conn., and to this time belong his first independent publications, 'Legends of New England' (1831), and 'Moll Pitcher' (1832). In 1833 he issued 'Justice and Expediency,' an anti-slavery pamphlet and acted as a secretary of the anti-slavery convention at Philadelphia, and a member of the committee which drafted the "declaration of principles." He sat in the Massachusetts legislature in 1835, and in the following year sold his farm and removed to Amesbury, some eight miles northeast of Haverhill, where he chiefly resided for the rest of his life. In 1836 he became a secretary of the Anti-Slavery Society, and in 1837 there appeared a volume of 'Poems Written During the Progress of the Abolition Cause in the United States.' With that cause he was now thoroughly identified. At Concord, N. H., he was mobbed with George Thompson (q.v.), during the latter's lecturing tour. Whittier edited the 'Pennsylvania Freeman' in Philadelphia during 1838-40, and in the first of these years his office was sacked and burned by a mob. In 1844-5 he edited the 'Middlesex Standard' in Lowell, and during

WHITTINGHAM — WHITTINGTON

1847-60 was corresponding editor of the 'National Era,' a Washington paper, sometimes writing half-a-dozen columns weekly of general articles and reviews. He also contributed to the 'Atlantic Monthly' from its foundation in 1857. His poem, 'A Word for the Hour' (January 1861), shows that he shrank from the Civil War and was prepared to let the Southern States secede. He hailed the end of the war and of slavery with delight, and did his utmost to induce the North to welcome back the South in the most generous spirit. His publications, after those above mentioned, include the following: 'Mogg Megone' (1836); 'Poems' (1838); 'Lays of My Home, and Other Poems' (1843); 'The Stranger in Lowell' (1845), 'Supernaturalism in New England' (1847), 'Leaves from Margaret Smith's Journal' (1849), an imaginative description of early New England, and 'Old Portraits and Modern Sketches' (1850), all four collected from the 'Era'; 'Voices of Freedom' (1846); 'Songs of Labor, and Other Poems' (1850); 'The Chapel of the Hermits, and Other Poems' (1853); 'Literary Recreations and Miscellanies,' also gathered from the 'Era' (1854); 'The Panorama, and Other Poems' (1856); 'Home Ballads and Poems' (1860); 'In War Time, and Other Poems' (1864); 'National Lyrics' (1865); 'Snowbound: a Winter Idyl' (1866); 'The Tent on the Beach, and Other Poems' (1867); 'Among the Hills, and Other Poems' (1869); 'Miriam, and Other Poems' (1871); 'The Pennsylvania Pilgrim, and Other Poems' (1872); 'Hazel Blossoms' (1875); 'Mabel Martin: a Harvest Idyl' (1875); 'The Vision of Echard, and Other Poems' (1878); 'The King's Missive, and Other Poems' (1881); 'The Bay of Seven Islands, and Other Poems' (1883); 'St. Gregory's Guest, and Recent Poems' (1886); and 'At Sundown' (1892), a posthumous volume. The Riverside edition of his works, both in prose and in verse, carefully revised and annotated by himself, appeared at Boston in 1888-9. The most complete edition of the poems is the one-volume Cambridge edition (1895). Whittier was long interested in politics, though his active part in it largely ceased with the development of anti-slavery opinion in the North. His services to the cause of anti-slavery were important. He wrote numerous occasional poems celebrating or denouncing incidents and events of the conflict, the best-known being the 'Ichabod' verses, "the most powerful that he ever wrote," rebuking the defection of Webster from the anti-slavery principles in the 'Seventh of March' speech. Opposed to the Civil War, he insisted, when it was begun, that slavery was the vital question; and during its progress contributed largely to the small quantity of valuable poetry that it evoked. Subsequently he devoted himself to presenting in narrative and ballad poems the legends, traditions, and history of colonial America, particularly New England; to describing, as he did notably in 'Snow-Bound,' rural scenes and conditions, the latter of which have passed into history; and to writing several hymns which appear in the collections of many denominations. His work had been criticised for its inequality and faulty rimes, and also somewhat for its moralizing tendency. Much of his verse does reveal a certain want of com-

pression and verbal selection, due principally to the fact that it was written with a readiness approaching improvisation. To object to his moralizing tendency is simply to object to the point of view of one who was originally and strongly a reformer. His leading characteristics are a fine simplicity, a convincing quality, and what Lowell styled as his "genial piety." He was less cosmopolitan than Longfellow, but by many critics has been ranked as not greatly inferior to that poet. Consult the biographies by Underwood (1875; new ed. 1883); Kennedy (1882); Linton (1893); Pickard (1894; the authoritative 'Life and Letters'); Barton (1900; 'Beacon Biographies'); and Carpenter (1903; 'American Men of Letters'). Also Fields, 'Whittier: Notes of His Life and His Friendships' (1893); Claflin, 'Personal Recollections of John G. Whittier' (1893); Pickard, 'Whittier as a Politician' (1900) and 'Whittier Land' (1904); and Stedman, 'Poets of America' (1886).

Whittingham, hwit'ing-ham, **William Rolin**son, American Protestant bishop: b. New York 2 Dec. 1805; d. Boston 17 Oct. 1879. He was graduated at the General Theological Seminary, New York, in 1825, ordained deacon in 1827, and priest 1829, and was in charge of St. Mark's Church, Orange, N. J., until 1831. He then became rector of St. Luke's, New York, and in 1835 he became professor of ecclesiastical history in the General Seminary, which position he held until his consecration as bishop of Maryland in 1840. In this office he commanded universal respect by the fullness and breadth of his scholarly attainments. He was generally recognized, especially in the historical field, as the most learned prelate in his communion. A convinced but fair and chivalrous controversialist, he advocated the principles of his faith in such a way as to win adherence to them in all parts of the country. The written evidence of his learning is, however, preserved principally in the pages of various periodical publications, such as 'The Churchman,' of which one time he was editor. During the Civil War, in opposition to many of the people in Maryland, he was unflinching in his advocacy of loyalty to the Federal government.

Whittington, hwit'ing-tón, **Richard**, English magistrate: b. Pauntley, Gloucestershire, about 1359; d. London March 1423. He became a mercer in London, a member of the common council in 1385 and 1387, subsequently alderman and sheriff, and mayor in 1397-8, 1406-7, and 1419-20. He was very liberal in charitable gifts. The legend which represents him as making his fortune by sending a cat in an outgoing ship to Barbary, where it was sold for a large sum, and as returning to London, which he had just quitted, on hearing Bow bells sounding what seemed to be

Turn again, Whittington,
Lord Mayor of London,

is without foundation; though it is treated as fact in the uncritical 'Lives' by Lysons (1860) and Besant and Rice (1881; 2d ed. 1894). Consult Clonston, 'Popular Tales and Fictions' (1887) and Wheatley's edition (for the Villon Society) of the 'History of Sir Richard Whittington' by T. H. (1885).

Whittlesey, hwit'l-sī, **Charles**, American geologist: b. Southington, Conn., 4 Oct. 1808; d. Cleveland, Ohio, 1886. He was graduated from West Point in 1831, served in the Black Hawk war of 1832 and resigned from the army in that year. He was admitted to the bar and engaged in law practice at Cleveland, where he was on the editorial staff of the 'Herald' in 1836-7, and in 1837-8 was engaged in the Ohio State geological survey. He was occupied in making a mineralogical and geological survey of the Lake Superior and upper Mississippi regions for the United States government in 1847-51, and in 1858-60 was attached to the Wisconsin geological survey. On 17 April 1861 he was appointed assistant quartermaster-general on the staff of the governor of Ohio, and in the western Virginia campaign served as chief engineer of the Ohio troops. He was appointed colonel in August 1861 and was subsequently chief engineer of the Department of the Ohio. He led his regiment at the battle of Fort Donelson and at the battle of Shiloh was in command of a division. Failing health compelled his resignation in 1862 and he resumed his surveys in the Lake Superior and upper Mississippi regions. He was one of the founders in 1867 of the Western Reserve Historical Society of Cleveland, and was for many years its president. His writings include more than 200 titles. Among them are: 'Description of Ancient Works in Ohio' (1851); 'Ancient Mining on the Shores of Lake Superior' (1863); 'Early History of Cleveland and Vicinity' (1867); etc.

Whittridge, hwit'rēj, **Worthington**, American artist: b. Springfield, Ohio, 22 May 1820. He studied art in Cincinnati, worked there as a portrait-painter 1842-9, later went to Europe, and studied under Andreas Achenbach at Düsseldorf, also in Paris, Belgium, Holland, and Rome, returning to the United States in 1859, to become noted as a landscape painter, his chief subjects being drawn from American scenery. Accompanying Gen. Pope on a tour of inspection at the West in 1874, he sketched many Rocky Mountain views. He was president of the National Academy of Design in 1875-6. His chief works include: 'House on the Hudson River' (1863); 'Old Hunting Ground' (1864); 'View of the Rocky Mountains from the River Platte' (1868); 'Trout Brook' (1875); etc.

Whitworth, hwit'wərth, **Sir Joseph**, English mechanical engineer: b. Stockport 21 Dec. 1803; d. Monte Carlo, Italy, 22 Jan. 1887. He worked as a mechanic in Manchester and London, discovered the method of making a truly plane surface, and in 1833 established himself as a tool-maker at Manchester. Between 1840 and 1850 he developed his measuring-machine, by means of which he elaborated his standard system of measures and gauges which was found by engineers to be of great usefulness. One of his devices which proved to be of much immediate service was that of a uniform system of screw-threads. He made many experiments in connection with rifles, and in 1857 perfected a hexagonal-barreled rifle of great range, accuracy, and penetrative power, highly excelling the Enfield, then largely in use. It was not accepted at the time by the War Department, as being of a calibre too small (.45) for a military weapon; though in 1869 the War Of-

fice declared that a weapon of such calibre would appear to be the most suitable. He was equally successful in the building of cannon, but his rifled gun with a 250-pound shell and a six-mile range, was rejected by the ordnance board in 1865, greatly to the detriment of British ordnance. His invention of compressed cast steel for ordnance was an important one, and came into general use. His works at Manchester were converted into a limited liability company in 1874, and in 1897 united with the Elswick works, established by Sir William Armstrong (q.v.). His fortune was devoted to the endowment of 30 scholarships in mechanics, and to the furthering of charitable and educational work. He was made a baronet in 1869. Among his writings were: 'The Industry of the United States in Machinery, Manufactures, and Useful and Ornamental Arts' (1854) and 'Miscellaneous Papers on Mechanical Subjects' (1858). Consult the memoir in the 'Proceedings' of the Institution of Civil Engineers, Vol. XCI. (1887-8). See **ORDNANCE**.

Whitworth Gun. See **ORDNANCE**.

Whitworth Scholarships, a name given certain scholarships established in England in 1869 by Sir Joseph Whitworth, to encourage the cultivation of combined theoretical and practical skill in the industrial arts of mechanics and engineering. They were placed by the founder under the charge of the English council of education, and are open to be competed for by any young man not 26 years complete, and who has been engaged in handicraft in the workshop of a mechanical engineer for at least three years. There are now four scholarships annually competed for of the value of \$500, tenable for three years, besides exhibitions tenable for one year, value \$250 and \$400.

Whooper, the whooping swan. See **SWAN**.

Whooping-cough. See **HOOPING-COUGH**.

Whooping Crane. See **CRANE**.

Whortle-berry. See **VACCINIACEÆ**.

Whydah, hwid'ā, French West Africa, a seaport town of Dahomey, on a lagoon communicating with the Bight of Benin, about 70 miles south of Abomey. It has a considerable trade in palm-oil. Pop. est. 15,000.

Whydah-bird, or **Widow-bird**, a weaver-bird (q.v.) of the West African subfamily *Vidua*, in which the tail-feathers are greatly prolonged and modified. The paradise whydah-bird is brownish-black, the head, chin, and throat being black, and the neck encircled by a brown collar. The under parts are pale brown. The tail is long and the two central feathers are elongated and possess broad webs at the tip and a slender shaft, while the two next feathers are about 11 inches long and are broadly webbed. The other tail feathers are set vertically. This species attains a length of five or six inches, exclusive of the tail feathers. The nest is said to be ingeniously made of cotton fibres, and to be divided into two compartments, in one of which the female sits on the eggs, the other being occupied by the male bird. The shaft-tailed whydah-bird (*P. regia*) is colored a rusty red on the head and neck, the back of the head and crown being black. The average length of this species is eight or nine inches; and the four central feathers are elongated, but consist each of the bare shaft

WHYMPER—WICHITA

or quill only, a slight web existing at their tips. Consult Newton, 'Dictionary of Birds' (New York, 1896).

Whymper, hwim'pér, **Edward**, English author and traveler: b. London 27 April 1840. He was educated privately, and in 1860 was sent by a London firm to make sketches of Alpine peaks. He ascended Mount Pelvoux in the French Alps in 1861, the Pointe des Ecrius in 1864, and in 1865 the Matterhorn. He visited northern Greenland in 1867 and in 1872, making valuable discoveries in evidences of a previous abundant, rich vegetation there, his collection of specimens being now a part of the collection of the British Museum. In 1879-80 he explored the Andes in Ecuador, discovered the Andean glaciers, and succeeded in ascending Chimborazo, a feat which Humboldt attempted and had failed to accomplish. In 1901 he made an exploring tour of Canada, ascending mountains and making investigations in the region of the "Great Divide." His publications include: 'Scrambles Among the Alps in the Years 1860-9' (1871); 'Travels Among the Great Andes in the Equator' (1892); 'Zermatt and the Matterhorn' (1897); etc.

Whyte-Melville, hwit'mél'vil, **George John**, British novelist: b. Fifeshire, Scotland, 19 June 1821; d. Vale of Aylesbury, Berkshire, 5 Dec. 1878. He was educated at Eton and at 18 joined the 93d Highlanders, from which he exchanged in 1846 into the Coldstream Guards. He retired in 1849 with the rank of major, but volunteered for active service in the Crimean war and was appointed major of the Turkish irregular cavalry. The rest of his life was chiefly devoted to fox-hunting and other field sports, and to the writing of novels of fashionable and sporting life. He was killed by the fall of his horse while hunting. The following are among his novels: 'Kate Coventry' (1856); 'Holmby House' (1860); 'The Queen's Maries' (1862); 'Bones and I' (1868); 'Contraband' (1870); 'Sarchedon' (1871); 'Satanella' (1873); 'Rosine' (1875); 'Roy's Wife' (1878); 'Black but Comely' (1879). He also published some volumes of verse.

Wiard, **Norman**, American inventor: b. Normandale, Ont., 1826; d. Reading, Pa., 11 Sept. 1896. In early life he was foreman in a foundry at Bradford, Ont., where he began experiments in founding ordnance. During the Civil War he was employed by the United States government in the manufacture of ordnance and projectiles, and was frequently called into consultation by the President and Secretary Stanton. After the war he applied himself to experiments and inventions in his special lines; patented a device for preventing the explosion of steam-boilers, which he sold to the United States and Japanese governments; spent two years in Japan in government employ; was for some time a military engineer in that country; and on his return to the United States conducted, near Boston, a series of experiments in gunnery which attracted wide attention.

Wiborg, ví'börg, or **Viborg**, Russia, (1) A town in Finland, capital of the government of its own name, on a bay in the Gulf of Finland, 72 miles northwest of Saint Petersburg, with which and with Helsingfors it is connected by railway. It is regularly built in spacious streets;

and has the ruins of a fine old castle, situated on an isolated rock in an arm of the sea. It carries on some iron-founding and other industries, and has a considerable trade in timber, deals, tar, tallow, and fish. The canal that connects the Gulf of Finland with Lake Saima starts at Wiborg. Pop. (1900) 32,312. (2) The government forming the southeastern region of Finland; has an area of 13,530 square miles. Pop. (1897) 394,412.

Wicas'set, Maine, town, port of entry, county-seat of Lincoln County; on the Sheepscot River, and on the Maine Central Railroad; about 48 miles northeast of Portland and 20 miles from the Atlantic. In 1760 the town was incorporated under the name of Pownalboro, and in 1802 it was reincorporated under the present name. Wicasset is a popular summer resort. It is in an agricultural region and has some manufacturing interests. It has two banks. Pop. (1890) 1,733; (1900) 1,273.

Wichern, vîh'ern, **Johann Heinrich**, German philanthropist: b. Hamburg 21 April 1808; d. there 7 April 1881. He studied theology at Göttingen and Berlin, and then returning to his native town gave himself up to endeavors to improve the condition of the poor and suffering. In the Rauhes Haus (founded 1 Nov. 1833) he established an institution for neglected children, with a training seminary for teachers connected with it, and similar institutions were shortly afterward formed throughout Germany. In 1856 he was appointed councillor of the Prussian ministry of the interior, and in 1858 superintendent of all penal and reformatory institutions in the kingdom. His writings include: 'Die Innere Mission der Deutschen Evangelischen Kirche' (1849); 'Die Behandlung der Verbrecher und Entlassenen Sträflinge' (1853); 'Der Dienst der Frauen in der Kirche' (1858). Consult Lives by Oldenburg (1881-6); Krummacher (1882).

Wichita, wîch'î-tā, Kan., city, county-seat of Sedgwick County; on the Arkansas River, and on the Missouri P., the Atchison, T. & S. F., the Wichita & C., the Wichita & W., the Chicago, R. I. & P., and the St. Louis & San Francisco R.R.'s; about 230 miles southwest of Kansas City. It is in a fertile agricultural region, and is the commercial and industrial centre of southern Kansas. The chief products of this section are wheat, corn, hogs, and cattle. The city is on a rolling prairie; it has broad, well-shaded streets, and a good system of waterworks and sewerage. The principal parks are Linwood, Riverside, and Griswold.

Business Interests.—In 1900 (Government census) the city had 328 manufacturing establishments, capitalized for \$2,108,524, and employing 1,649 persons, to whom were paid annually in salaries and wages \$750,206. The raw material used each year cost \$3,000,661, and the value of the finished products was \$4,724,068. The chief manufactures were 7 confectionery, whose products brought annually \$171,613; 10 flour and grist mills, annual products \$457,275; 11 saddlery and harness works, products \$168,565; and 18 men's clothing establishments, products \$102,452. The estimated number of employees in manufactures in 1904 was 4,000. Other manufactures were foundry and machine-shop products, furniture, lumber products, brick, tile, books and papers, tobacco products, brooms,

WICHITA FALLS — WICLIF

brushes, and wood and paper boxes. The city has large meat-packing houses, and a number of wholesale and jobbing houses.

Public Buildings, Churches, and Schools.—The principal buildings are the Government building, the county court-house, city-hall, three commercial blocks, opera houses, and hotels. The Scottish Rite Masonic Cathedral is a noteworthy building. There are 37 churches, representing 18 different denominations. It is the episcopal see of a Roman Catholic bishop. There are a city hospital, Saint Francis Hospital, Saint Joseph's Orphan Asylum, The Martha Washington Home, Children's Home, and a city orphanage. The educational institutions are the Friends' University (1898); Fairmount College (Cong.), opened in 1892; the Albert Magnus College (R. C.), opened in 1900; Kansas College of Osteopathy, All Hallows Academy (R. C.), Lewis Academy (Presb.), Wichita Business College, Wichita Commercial College, a public high school, opened in 1877, public and parish schools, and a public library which contains about 8,000 volumes.

Banks.—There are eight banks, four national, three state, and one private. They have a combined capital of \$500,000 and (1903) deposits amounting to \$4,470,270.

Government.—The government is administered under a charter of 1886, which provides for a mayor, who holds office two years, and a city council of 12 members from six wards. The board of education is chosen by popular vote.

History.—Wichita was settled in 1869 by Indian traders. In 1870 it was incorporated, and in 1872 was chartered as a city of the second class. Pop. (1900) 24,671; (1903, est. Govt. Report) 24,917; (1904 school census) 31,700.

M. M. MURDOCK,

Editor of 'Wichita Daily Eagle.'

Wichita Falls, Texas, county-seat of Wichita County; on the Wichita River, and on the Wichita Valley railroad; about 115 miles northwest of Fort Worth. It is in an agricultural and stock-raising region. It has two national banks with a combined capital of \$150,000 and deposits (1903) amounting to \$385,000. Pop. (1890) 1,987; (1900) 2,480.

Wichita Indians. One of the southern tribes of the Caddoan linguistic stock of North American Indians whose traditional home was the Wichita Mountains of Oklahoma, near which their reservation now lies. In the first half of the 19th century their principal village was on the north fork of Red River, a short distance below the mouth of Elm Creek, in Oklahoma, but three centuries ago (in 1541) Coronado found them in Kansas, between the Arkansas and Kansas rivers, in what the Spaniards designated the province of Quivira (q.v.). The typical house of the Wichitas is the grass lodge; they were always agriculturists, and formerly practised tattooing, from which custom and from their resemblance to their congeners, the Pawnees, they were called by the French *Pani Piqués*. They are now under the Kiowa agency in Oklahoma, where, with their subtribes, the Tawakoni and Waco, they number more than 300.

Wicklow, wîk'lô, Ireland, a maritime county of Leinster Province, on the Irish Sea, with an area of 782 square miles. Chief town, Wicklow. The county generally is mountain-

ous, but has fertile lowlands where oats and potatoes are cultivated, and much pasture land devoted to stock-raising. Copper, lead, and iron are mined. Pop. (1901) 60,824.

Wicksteed, Philip Henry, English Unitarian clergyman and Dante scholar: b. Leeds, Yorkshire, 25 Oct. 1844. He was educated at University College, entered the Unitarian ministry in 1867, and was minister of Little Portland Street Chapel, London, 1874-97. Since 1887 he has been prominent as a university extension lecturer, especially on Dante, Ibsen, and economics. He has published: 'Dante: Six Sermons' (1880); 'Alphabet of Economic Science' (1888); 'Henrik Ibsen' (1892); and the translation and notes of the Temple edition of Dante's 'Paradiso.'

Wiclif, wîk'lîf (**Wicliffe, Wiclef, Wickliff, or Wycliff**), John, English reformer: b. Spreswell, Yorkshire, probably about 1330; d. Lutterworth 31 Dec. 1384. He studied at Balliol College, Oxford, of which he became master at some date between 1356 and 1361, in which latter year he was appointed by his college to the living of Fillingham, in Lincolnshire. About the same time the pope bestowed upon him a prebend in the collegiate church of Westbury-on-Trym, near Bristol, in which he was confirmed by the king. In 1368 he gave up Fillingham and accepted the living of Ludgershall, in Buckinghamshire, and four years later qualified as doctor of theology. He was presented by the crown in 1374 to the benefice of Lutterworth, in the south of Leicestershire, which he held till his death. A Latin tract 'Determinatio quædam Magistri Johannis Wycliff de Dominio contra unum Monachum,' has been regarded as belonging to the controversy raised by the refusal of the parliament of 1366 to pay a tribute demanded by the Pope Urban V., in virtue of the homage paid by King John to Innocent III., but some authorities refer it to a date about ten years later, when similar circumstances arose. At the time of writing the tract Wiclif was a kind of royal chaplain, for he calls himself *peculiaris regis clericus*, and in 1374 was named second on a commission which went to Bruges to try to settle disputes concerning ecclesiastical jurisdiction with the representatives of the Pope Gregory XI. He had shortly before been appointed a canon of Lincoln, but never actually obtained a prebend in that cathedral. The development of his views on the relation between the ecclesiastical hierarchy and the secular authorities brought him into close association with John of Gaunt, duke of Lancaster, and his party, and in 1377 the anti-Lancastrians sought to strike at their political opponents through Wiclif. He was summoned in that year before Archbishop Sudbury and his suffragans at St. Paul's, and attended, accompanied by Lancaster, Lord Percy, and other powerful Lancastrians. A violent altercation between the duke and William Courtenay, bishop of London, caused the break-up of the meeting, and the infuriated populace plundered Gaunt's palace and attacked Percy's house. Soon afterwards Pope Gregory sent several bulls to the University of Oxford, the Archbishop of Canterbury, and the bishop of London, in which he accused Wiclif of teaching the condemned doctrines of Marsilius of Padua and John of Jan-dun, and ordered him to be arrested and exam-

ined. The parties were reluctant to move in view of Wiclif's great popularity and influence, and even after the bulls had arrived he was consulted by the government as to whether they might legally prevent money from going abroad to absentee holders of benefices. He eventually appeared before the prelates at Lambeth in 1378, but the king's mother sent a message forbidding them to interfere with him, and a popular demonstration in his favor put an end to the proceedings. In the Gloucester parliament of 1378 he made a defence of John of Gaunt, who had grossly violated the Westminster right of sanctuary.

This year, 1378, was an important date in Wiclif's religious career. While continuing to inveigh against certain abuses, he now began to question the whole basis of sacerdotalism and its authority, and by 1381 had attained to a substantially Lutheran position in regard to transubstantiation and the mass. About this time also he began to make his appeal to the common people and to present religion as a popular force rather than a dogmatic system or an organized institution. This appeal assumed two forms, the sending out of his "poor preachers" and the translation of the Bible from the Vulgate into the English of his day. His itinerant evangelists spread his doctrines throughout the land and soon made the Lollard movement one of great strength and importance. In his translation of the Bible he had the assistance of Nicholas Hereford, who was responsible for most of the Old Testament, and the whole work was revised by his assistant at Lutterworth, John Purvey, who finished it soon after Wiclif's death. Wiclif's views on the eucharist were promptly condemned at Oxford and forbidden to be taught there, and in 1382 Courtenay, archbishop of Canterbury, summoned a council in the Blackfriars' convent hall, at which Wiclif's teaching was condemned and some of his followers excommunicated. This council, known as the "earthquake council" because a violent earthquake occurred during the meeting, ordered the Carmelite Dr. Stokes to publish the condemnation at Oxford. The chancellor of Oxford University at that time, Robert Rygge, was a supporter of Wiclif and evaded the duty of carrying out the council's mandate until absolutely compelled to do so. Wiclif himself remained untouched, but he retired to Lutterworth, where he occupied himself in preaching and writing. It is said that Urban VI. summoned him to Rome in 1384, but this is doubtful. He had a paralytic stroke in 1382 or 1383, and again in 1384, from which he died. He was buried at Lutterworth, but in 1428, in accordance with a decree of the council of Constance in 1415, his body was exhumed and burned, and his ashes thrown into the river Swift.

Of the 24 Wiclifite propositions condemned by the earthquake council ten were described as heretical and 14 as erroneous. The most important of the ten were: that transubstantiation is philosophically false, since the substance cannot be changed while the accidents remain; that transubstantiation is not taught in the Gospels; that confession is not necessary to salvation; that no one after Urban VI. should be recognized as pope; and that it is unscriptural for ecclesiastics to hold temporal possessions. Of the erroneous doctrines, several seriously limited the right of excommunication in a distinctly

Protestant sense, one asserted the right of unlicensed preaching, another declared that dominion, whether civil or ecclesiastical, could not belong to one in mortal sin, and another distinctly asserted the authority of the temporal power over the ecclesiastical in temporal affairs. Wiclif unmistakably made his appeal to Scripture as of higher authority than Church tradition or decrees, and had a strong sense of the individualistic basis of religion. He never reached the Lutheran doctrine of justification by faith, but from denunciation of abuses in the Church rapidly advanced to his three main positions: that all dominion was of divine origin and was forfeited by anyone in mortal sin; that transubstantiation was a doctrine both unphilosophical and unscriptural; and that monasticism in every form was a corrupt institution.

At first he attacked only the luxurious and corrupt orders of monks and was on friendly terms with the friars, but from about 1379 the friars were also included in his condemnation. He was one of the last of the realists in philosophy, and he tried to reconcile predestination with the freedom of the human will. Not only was Wiclif one of the chief forerunners of the Reformation, but he was also a pioneer in English prose literature. He wrote many learned works in Latin, but the nature of his message and the necessities of his position led him to appeal to the people in works in their own tongue. His chief Latin works are: 'De Dominio Divino'; 'De Dominio Civili'; 'De Officio Pastoralis,' and 'Dialogus.' All, except the 'Dialogus' and the 'De Officio Pastoralis,' and also volumes of Latin sermons and a volume of Polemical Works, have been edited by English and foreign scholars for the Wiclif Society. The excepted works were edited by Lechler (1869 and 1863 respectively). His translation of the Bible was edited by Forshall and Madden (1850); and his English works are to be found in the three collections: 'Three Treatises of John Wycliffe' (1851), by Todd; 'Select English Works of Wycliffe' (1869-71), by T. Arnold; and 'The English Works of Wycliffe' hitherto unprinted (1880, Early English Text Society), by F. D. Matthew.

Consult: 'Wiclif' in the Dictionary of National Biography; Lechler, 'Johann von Wiclif und die Vorgeschichte der Reformation' (1873); Poole, 'Wycliffe and Movements for Reform' (1889), and 'History of Mediæval Thought' (1884); Burrows, 'Wiclif's Place in History' (1881); Buddensieg, 'Johann Wiclif und seine Zeit' (1885); Sargeant, 'John Wycliffe' (1893), in 'Heroes of the Nations'; Loserth, 'Hus und Wiclif' (1884; Eng. trans. 1884); Trevelyan, 'Age of Wycliffe' (1898).

Widdin, vid'in, or **Vidin**, Bulgaria, a town on the right bank of the Danube, near the Servian frontier, consisting of three parts, the town on the Danube, the walled city, and the citadel. The principal buildings are the palace, several mosques with lofty minarets, and a range of bazaars lining the main street. Ships can reach the town at high-water. There is a considerable trade, chiefly in corn, wine, and salt, and the chief manufacturers are gold and silver filigree work and jewelry. Widdin was formerly strongly fortified and during Russo-Turkish wars was important strategically, but the treaty of Berlin (1878), which erected Bul-

WIDE AWAKES—WIDOW

garia into a hereditary principality tributary to the Porte, decreed that its fortifications should be dismantled. Pop. (1893) 14,551.

Wide Awakes, in American political history, a name adopted by numerous Republican campaign clubs organized for the purpose of aiding in the election of Abraham Lincoln during the presidential campaign of 1860. The first club was organized in Hartford, Conn. It is stated that in New York city there were on one occasion 20,000 Wide Awakes marching in procession.

Wide, Wide World, The, a tale by Susan Warner, published in 1851 under the pen name of "Elizabeth Wetherell." It reached a sale of over 300,000 copies. The life of the heroine, Ellen Montgomery, is followed from early childhood to her marriage with a fullness of particulars which leaves nothing to the reader's imagination. The scenes and episodes are those of a homely every-day existence, described with a close fidelity to detail. Ellen's spiritual experience is minutely unfolded, and the book was long regarded as one of those which are "good for the young." The criticism of a later generation, however, pronounces it mawkish in sentiment and unreal in conduct. It stands among the fading fancies of an earlier and less exacting literary taste.

Widener, Peter A. Brown, American capitalist: b. Philadelphia, Pa., 13 Nov. 1834. He acquired a large fortune in the meat business, entered politics, was appointed city treasurer of Philadelphia in 1873 and in 1874 was re-elected to that office. He is largely interested in street railway corporations. In 1897 he presented to the city of Philadelphia his private residence, valued at \$600,000, for a branch of the Free Lending Library, and in the following year gave to the library a collection of 500 rare books valued at \$28,000. In 1899 he endowed at Philadelphia the Widener Memorial Training School for Crippled Children, a combined home, hospital, and school. The school site consists of a tract of 36 acres at Logan, a Philadelphia suburb.

Widgeon, or **Wigeon**, a river-duck of the genus *Marcca*. Widgeons have a short bill, much rounded at the tip, with a strong, broad nail, and the upper lamellæ prominent; wings long and pointed; tail moderate and wedge-shaped. There are about 10 species in various parts of the world. They are found on the seashore and on the margins of lakes and rivers, feeding chiefly on vegetable substances, and performing periodical migrations at night in vast flocks. The American widgeon or baldpate (*M. americana*) is about 20 inches long and 35 in alar extent; the bill is blue, black at the base and tip; upper parts finely waved transversely with dark lines; lower parts mostly white; top of head nearly white, with a broad green patch around and behind the eyes; rest of head and neck grayish, spotted and banded with black; wing-coverts white, the greater tipped with black; speculum green, encircled by black. The baldpate is found throughout North America, breeding chiefly north of the United States and wintering in Central America. It is an active bird, with a swift and well sustained flight, in ranks of various and irregular forms; and it associates during the winter with teals and other ducks. The flesh is highly esteemed,

especially when they have fed in the rice fields of the south, or along with the canvas-back on the water-celery of the Chesapeake. They do not dive, but feed with the head and neck immersed, swimming very near together. The food consists of aquatic seeds, roots, insects, worms, small fry, leeches, nuts, and grain, especially rice in the rainy season; being very fond of the tender aquatic plants on which the canvas-back feeds, and no diver itself, it watches the latter and snatches the morsels as it emerges and before it has had time to open its eyes. They are among the most difficult ducks to shoot, owing to their shyness and swift, irregular flight. The nest is built on the ground, often far from water, and usually of leaves lined with down. The eggs number 8 or 10, are pure ivory white, and about 2 inches long by nearly 1½ in diameter. The European widgeon (*M. penelope*) is rather smaller, and not uncommon all along the Atlantic coast of the United States, as well as on the Pacific. It differs chiefly in having the head and neck reddish brown or cinnamon, the top of the head cream-colored. Consult Grinnell, 'American Duck Shooting' (New York, 1902).

Widmann, vīd'n-mān, **Max**, German sculptor: b. Eichstätt, Bavaria, 13 Oct. 1812; d. Munich, Bavaria, 3 March 1895. He was educated at Munich and at Rome, executing while at the latter city his "Shield of Hercules," considered one of his masterpieces, and in 1849 became professor of sculpture at the academy of Art at Munich. Several of the public monuments in that city are by him, but his best work is considered to be shown in his busts and statuettes, which, however, are fewer in number. His statues include those of Orlando de Lasso (1848); Schiller (1863); Goethe (1868); Castor and Pollux (1877). Specimens of his workmanship are to be found at Bamberg, Ratisbon, Würzburg, and other cities.

Widnes, England, a manufacturing town in Lancashire, on the Mersey, opposite Run-corn, 13 miles east-southeast of Liverpool by rail. There are extensive chemical, alkali, and soda works; soap, candle, grease, and manure works; copper-smelting works and rolling-mills, and iron-foundries. The town has a considerable carrying trade, which has been further developed by the construction of large docks in 1866, extended in 1884. Pop. (1901) 28,580.

Widow, a married woman who becomes bereft of her husband; a grass-widow is a divorced woman. In 1900 there were 2,720,000 widows in the United States, of which 320,000 were in New York State, 128,000 in Massachusetts and 88,000 in Indiana. There were but 8,000 in Utah. New York city contains 105,000 widows and Chicago but 23,097. Among the ancients was practised a form of funeral sacrifice, in which the widow was slain or induced to commit suicide so that she might be buried with her husband and accompany him to the world of spirits. This practice is mentioned as existing among the Greeks by Euripides and Pausanias, and from Cæsar it may be inferred that it existed also in Gaul. Widow sacrifice is still the custom in many African tribes; traces of it may be found in China; it lingered till late in the first half of the 19th century in Fiji, and though abolished by law in British India in 1829, is not yet abandoned.

WIDOW BEDOTT PAPERS — WIESBADEN

Widow Bedott (bē-dōt') **Papers, The**, a collection of broadly humorous sketches by Frances Miriam Whitcher, which appeared first in Neal's 'Saturday Gazette' of Philadelphia, about 1847, and in book form in 1855. They were extremely popular in their day and are still read and quoted from, though they have been followed by many works in a similar vein, such as Marietta Holley's 'My Opinions and Betsey Bobbett's' (1873), to mention one of the best known.

Widow Bird. See WHYDAH-BIRD.

Wieland, vē'lānt, Christoph Martin, German author: b. Oberholzheim, near Biberach, 5 Sept. 1733; d. Weimar 20 Jan. 1813. Having received a thorough preparation, he went in 1750 to the University of Tübingen to study law, but most of his time was devoted to belles-lettres. In 1751 appeared his 'Zwölf Moralische Briefe,' which met with very favorable reception. He also wrote at this time the didactic poem, 'Anti Ovid.' In 1752 he went to Zurich as a literary companion to J. J. Bodmer (q.v.). He was inspired by the deeds of Frederick the Great to write a poem exhibiting the ideal of a hero, for which purpose he chose the story of Cyrus. The first five cantos appeared in 1759, but the poem remained unfinished. About this time he published 'Araspes and Panthea,' an episode from the 'Cyropædia' of Xenophon. In 1754 he left Bodmer's house, became a tutor, and in 1760 returned to Biberach, where he translated 28 of Shakespeare's plays (1762-8). In 1762 he went to live with Count Stadion, an accomplished scholar, but a thorough man of the world, averse to all religious enthusiasm. Wieland had been formerly prone to religious mysticism, but the gay pleasure-seeking life of the society with which he now came in contact, and the sceptical and cynical kind of literature now most at his command, produced an entire change of sentiment. The first production of his bearing the stamp of his new philosophy of life was the tale of 'Nadine,' which he called a composition in Prior's manner. This was followed in 1764 by 'Die Abenteuer des Don Sylvio de Rosalva' ('The Adventures of Don Sylvio de Rosalva'), a work in which he took Don Quixote as a model. In 1766-7 appeared his 'Agathon,' which established his reputation. His chief work devoted to the subject of love, which at this time occupied much of his attention, is 'Musarion' (1768), a production distinguished for grace, ease, and harmony. In 1770 he wrote 'Die Grazien' ('The Graces'); and the 'New Amadis' in 1771, a poem which celebrates the triumph of intellectual over mere physical beauty. In 1769 he was appointed *professor primarius* of philosophy at the University of Erfurt. In his 'Verklagter Amor' ('Cupid Accused') he defended amatory poetry; and in the 'Dialogen des Diogenes von Sinope' (1770) gave a general vindication of his philosophical views. In 1772 he was invited to Weimar by the Duchess Anna Amalia as tutor to her two sons, and now turned his attention to dramatic poetry, and wrote his 'Wahl des Hercules' ('Choice of Hercules'), and his 'Alceste.' He also edited the 'Deutscher Mercur,' a monthly, which he conducted till near the close of his life. His views, as exhibited therein, showed too much of the narrow conventional spirit of French criticism, and he was therefore attacked

by Goethe, who wrote a satire against him under the title of 'Götter, Helden, und Wieland' (Gods, Heroes, and Wieland), which Wieland answered with great good nature, recommending it to all who were fond of wit and sarcasm. Goethe and Herder were soon drawn to Weimar, where the Duchess Anna Amalia formed a circle of talent and genius. Schiller afterward joined the circle. In 1773 appeared his 'Geschichte der Abderiten.' 'Oberon' (1780), a romantic epic, is the most successful of his larger works. Wieland also prepared translations of Horace, Lucian, and the 'Letters' of Cicero. He superintended (1794-1802) an edition of his 'Works' in 45 volumes. These were also edited by Gruber (1818-28 and 1867-75), and there are many editions of selections, some of which have been translated into English. Consult: Loebell, 'Entwicklung der Deutschen Poesie' (1858); Ranke, 'Zur Beurtheilung Wielands' (1885); Hirzel, 'Wieland und Martin und Regula Kunzli' (1891); and Gruber's biography, with his editions.

Wiener, vē'nēr, Leo, American author and educator: b. Russia 27 July 1862. He was educated at the gymnasia of Minsk and Warsaw, at the University of Warsaw and the Polytechnic of Berlin. From the latter city he went to New Orleans, worked in a cotton factory, and later sold fruit in Kansas City, Mo. He then obtained a position as teacher in Odessa, Mo., and afterwards a professorship in the University of Missouri, and was next appointed to his present position as assistant professor of Slavonic languages at Harvard. Among his publications are: 'History of Yiddish Literature in the 19th Century'; 'Anthology of Russian Literature'; 'Slavic Anthology'; and he has edited Rosenfeld's 'Songs from the Ghetto.'

Wiener-Neustadt, vē'nēr-noi'stāt, Austria. See NEUSTADT.

Wiertz, vērts, Anton Joseph, Belgian painter: b. Dinant 22 Feb. 1806; d. Brussels 18 June 1865. He studied art in the Antwerp Academy, where he gained, in 1832, a prize which enabled him to continue his studies in Rome. On his return to Belgium he lived at Liège for a time, and from 1848 at Brussels, where the Belgian government erected a large studio for him in 1850. Wiertz was a painter of great, though eccentric, genius, with a strange predilection for horrible and fantastic subjects, and invented a method of painting, called by himself *peinture mixte*, in which the characteristics of fresco and oil painting are combined. His principal pictures are: 'Greeks and Trojans contending for the Body of Patroclus'; 'The Flight into Egypt'; 'Death of Dionysius'; 'The Triumph of Christ' (1848), his masterpiece; 'The Things of To-day in the Eyes of the Men of the Future'; 'The Beacon of Golgotha'; 'The Last Cannon'; 'Napoleon in Hell'; 'A Second after Death.' He did not sell any of his chief paintings, which he bequeathed to the state, but supported himself by painting portraits. His Brussels studio, fitted up after his death as the Musée Wiertz, contains his large pictures. He wrote 'Eloge de Rubens' (1840); and 'Caractères Constitutifs de la Peinture Flamande' (1863). Consult Labarre, 'Antoine Wiertz' (1866).

Wiesbaden, vēs'bā-dēn, Prussia, (1) A town in the province of Hesse-Nassau, capital

of the government of Wiesbaden, and formerly capital of the Duchy of Nassau, beautifully situated among vineyards and orchards on the southern slopes of the Taunus range, about three miles north of the Rhine and 20 miles west of Frankfurt. It annually attracts about 80,000 visitors from all parts of Europe by its baths. Among notable buildings are the royal palace, the ducal palace, the town-house, the government buildings, the court-house, the museum and picture-gallery, the library (100,000 vols.), the royal court theatre, the Trinkhalle, and the Kurhaus, consisting chiefly of a large and splendid saloon, forming the east side of a square, while the north and south sides are lined by colonnades, filled with gay shops, and uniting a promenade and a bazaar. The springs, all of which except one are alkaline and among the most powerful of their class, are very numerous, and have temperatures varying from 100° to 153° F. The springs of Wiesbaden are spoken of by Pliny as the "Fontes Mattiaci," and on the Heidenberg, north of the town, traces of a Roman fortress were discovered in 1838, which seems to have been connected with the town by a wall, the Heidenmauer ("heathen's wall"), in the ruins of which votive tablets and inscriptions have been discovered. Pop. (1900) 86,111. (2) The government of Wiesbaden comprises almost the whole of the former Duchy of Nassau, most of the territory which belonged to the city of Frankfurt, etc. Area, 2,108 square miles; pop. (1900) 1,007,839.

Wife. See LAW OF HUSBAND AND WIFE.

Wig, an artificial hair covering for the head to conceal baldness. The use of wigs is traced back to the ancients. They were used especially by the women. The fashion is said to have been copied by the Greek ladies from those of Egypt. Under the Roman emperors it became common even for men to wear wigs, and several of the emperors themselves used this ornament. In the latter half of the 16th century the fashion became much in vogue in France, Italy, and England. In 1560 no lady appeared at the French court without a blonde wig. Louis XIV. was at first averse to wigs; but in the latter part of his reign, when he began to lose his own hair, he reintroduced the fashion, which went to a greater extreme than ever. About 1660 they began to be worn by the clergy, who had at first shown themselves hostile to the practice. The practice of powdering these wigs was adopted about the year 1700. About 1720 the great wig began to give place to the queue, which remained the fashion till early in the 19th century. Modern refinement has abolished the wig as an ornament except in Great Britain for the lord-chancellor, judges, and barristers.

Wig'an, England, a town of Lancashire, on the Douglas, 21 miles northeast of Liverpool. Wig'an stands in the centre of an extensive coal field, and its manufactures, which are important, consist chiefly of calicoes, fustians, and other cotton goods, linens, checks, cotton twist, etc., besides iron foundries, iron forges, railway car works, iron rolling mills, large breweries, chemical works, and corn and paper mills. Pop. (1901) 60,770.

Wiggin, wig'ın, **Kate Douglas Smith**, American author: b. Philadelphia, Pa., 28 Sept. 1857. She was educated at Abbott Academy, Andover, Mass., and in 1876 went to California,

where she studied the kindergarten system in Los Angeles, and later at San Francisco organized the first free kindergarten in the West. In 1880 she was married to S. B. Wiggin, a lawyer (d. 1889), and removed to New York. In 1895 Mrs. Wiggin was married to George C. Riggs. She published, with her sister, Nora A. Smith: 'Froebel's Gifts' (1895); 'Kindergarten Principles and Practice' (1896); etc. Her other works, several of which have attained great favor in this country and England include: 'The Bird's Christmas Carol' (1888); 'The Story of Patsy' (1889); 'A Cathedral Courtship' (1893); 'Mann Lisa' (1896); 'Penelope's Progress' (1898); 'Penelope's Experience in Ireland' (1901); 'Diary of a Goosegirl' (1902); 'Rebecca of Sunnybrook Farm' (1903); etc.

Wigglesworth, wig'lz-wérth, **Michael**, American Puritan clergyman: b. Yorkshire, England, 1631; d. Malden, Mass., 10 June 1705. In 1638 he was brought to Charlestown, Mass., by his father and accompanied him in the same year to New Haven, Conn. He was graduated from Harvard in 1651, subsequently becoming a tutor there. He then studied theology and was settled as pastor of the Church of Malden in 1656. He was accounted skilful in medicine, and was offered the presidency of Harvard in 1684, but on account of ill health declined the honor. His best-known work, 'The Day of Doom' (1662), was a popular poem in New England for a long period. Two editions were printed in England and the 6th edition in New England appeared in 1715. The savage Calvinism of the poem is unsurpassed in literature save perhaps in Jonathan Edwards' sermon, 'Sinners in the Hands of an Angry God,' but the work contains not a little dramatic force and here and there passages of dignity and beauty. He also wrote: 'God's Controversy with New England' and 'Meat out of the Eater,' in verse; and 'A Discourse on Eternity.' Consult: Tyler's 'History of American Literature' (1878); and Dean, 'Memoir of Michael Wigglesworth' (1863, new ed., 1871).

Wight, wit, **Orlando Williams**, American physician and translator: b. Centreville, N. Y., 19 Feb. 1824; d. Detroit, Mich., 19 Oct. 1888. He was educated at the Rochester Collegiate Institute, removed to New York in 1847, studied theology and was ordained to the Universalist ministry. He subsequently studied medicine, being graduated from the Long Island College Hospital in 1865. He engaged as a medical practitioner in Wisconsin, and was appointed state geologist and surgeon-general in 1874. He was health commissioner of Milwaukee in 1878-80, and health officer of Detroit in 1882-8. He was a noted translator and throughout his life devoted a large share of his time to literary work. He wrote: 'Maxims of Public Health' (1884); 'Peoples and Countries Visited' (1888); etc. His translations include: 'History of Modern Philosophy,' with F. W. Ricord (1852); 'Lives and Letters of Abélard and Héloïse' (new ed., 1861); Martin's 'History of France,' with Mary L. Booth (1863); etc. He also edited 'Standard French Classics' (14 vols., 1858-60); 'The Household Library' (18 vols., 1859, *et seq.*); etc.

Wight, Peter Bonnett, American architect: b. New York 1 Aug. 1838. He was graduated from the College of the City of New York

WIGHT, ISLE OF—WILBERFORCE

in 1855, practised as an architect in New York in 1861-71, and since 1871 in Chicago. He has been secretary of the Illinois State board of architects since 1897, was elected to the American Institute of Architects in 1866, and since 1900 has been secretary of the Municipal Art League of Chicago.

Wight, Isle of, England, off the south coast, in the county and opposite to the mainland portion of Hants, is separated from the mainland by the roadstead or channel of Spithead on the east, and by the Solent or continuation of this on the west. It is about 23 miles in length from east to west, by 15 miles broad; circuit about 70 miles; area, 146 square miles. The general appearance of the island is exceedingly diversified; the air is remarkably healthful. Only a small portion of the surface is waste. The downs, which cross the island from east to west and form excellent sheep-walks, separate it into two districts, which in their general character contrast with each other, the soil on the north side being generally a stiff, cold clay, and on the south side a fertile sandy loam. Excellent cement is manufactured at the works on the west side of the Medina, and largely exported. The chief imports are cattle, coal, timber, and building material. The island is well defended, being protected on the east side by Sandown Fort, Bembridge Fort and Battery, and by other forts which lie between the island and the mainland. The western approach is guarded by Hurst Castle and other forts.

The chief towns are Newport (the capital), Ryde, Cowes, Ventnor, Brading, Yarmouth, and the fashionable health-resorts of Sandown and Shanklin on the southeast coast. Osborne, near Cowes, was a residence of Queen Victoria, and with its beautiful grounds is now a national memorial, the gift of Edward VII.

Among the antiquities of the Isle of Wight the most interesting is Carisbrooke Castle, which stands a little southwest of Newport, and consists of extensive and well-preserved picturesque ruins. It has many historical associations: it is supposed to have originally been a fortress of the Britons, was afterward repaired and enlarged by the Romans, was considerably strengthened under Cerdic, who founded the kingdom of Wessex, and rebuilt in the reign of Henry I. During the Parliamentary war it became the asylum of King Charles I. on his escape from Hampton Court, and afterward his prison. Another interesting remain is Quarr Abbey, about 2½ miles from Ryde, which was built in 1132, and is now a farmhouse. Pop. (1901) 82,387.

Wigwam, among the American Indians a name applied to a hut or cabin, generally of a conical shape, formed of bark or mats laid over stakes planted in the ground, and converging toward the top, where there is an opening for the escape of the smoke. The word has also been applied to a large temporary structure for public gatherings.

Wilars de Honcourt, vē-lār dē hōn-koor, French architect of the 13th century. He is one of the earliest recorded experimenters with the perpetual motion theory, his rude drawings of his plans being still preserved in his sketch book at the Ecole des Chartes at Paris.

Wilber, wīl'bēr, Neb., village, county-seat of Saline County; on the Big Blue River, and

on Chicago, Burlington & Quincy railroad; 30 miles southwest of Lincoln. It is in a rich agricultural region, in which the chief products are wheat and corn. It has flour mills, grain elevators, machine shop, creameries, and cigar factories. There are six churches, a high school, and a county court-house. The two banks have a combined capital of \$75,000.

Wilberforce, wīl'bēr-fōrs, **Robert Isaac**, English clergyman, 2d son of William Wilberforce (q.v.): b. Clapham, Surrey, 19 Dec. 1802; d. Albano, Italy, 4 Feb. 1857. He was graduated from Oriel College, Oxford, in 1823, and was subsequently chosen fellow of his college, associating in that capacity with Pusey and Newman, Hurrell Froude and other leaders of the high church party. In 1830 he left Oxford to take charge of a parish, and became vicar in 1840 of Burton Agnes, Yorkshire. He published 'Church Courts and Discipline' (1843); 'Lucius, or Stories of the Third Age' (1842); 'Doctrine of the Incarnation' (1848); and 'Doctrine of Holy Baptism' (1849), the two last attracting great attention by the very positive doctrines they enunciated. He also published a 'History of Erastianism' (1851); 'Doctrine of the Eucharist' (1852); 'Inquiry into the Principles of Church Authority' (1854); etc. Finding that he could no longer consistently hold his position in the Church of England, he was received into the Roman Catholic Church in Paris in October 1854.

Wilberforce, Samuel, English prelate, 3d son of William Wilberforce (q.v.): b. Clapham, Surrey, 7 Sept. 1805; d. near Dorking, Surrey, 19 July 1873. He was graduated from Oriel College, Oxford, in 1826, ordained deacon in 1828, and appointed curate of Checkendon, Oxfordshire, the same year. He was rector of Brightstone, in the Isle of Wight, 1830-40, in 1839 became archdeacon of Surrey, and in 1840 a canon of Westminster. In the last named year also he became rector of Alverstoke, Hampshire. He received the deanery of 'Westminster in March 1845, but before the close of that year was promoted to the bishopric of Winchester. He was the leader of the High Church party, though much opposed to ritualism, and was both witty and eloquent as well as a skilful debater in the House of Lords. His readiness in argument and his versatile qualities gained him the title of "Soapy Sam." He published 'Note-book of a Country Clergyman' (1833); 'Eucharistica' (1839); 'A History of the Protestant Episcopal Church in America' (1844); 'University Sermons'; etc. Consult the 'Life' by his son, R. G. Wilberforce (1888); Daniell, 'Bishop Wilberforce' (1891).

Wilberforce, William, English philanthropist: b. Hull, Yorkshire, 24 Aug. 1759; d. London 29 July 1833. Educated at Cambridge, he was in 1780 elected member of parliament for his native town; and in 1784 was returned both by his former constituency and by that of the county of York. He chose to represent the latter. In 1786 he made the acquaintance of Clarkson, who gained his sympathies on behalf of the agitation against the slave-trade, to which he henceforth devoted all his energies in parliament till the agitation proved successful. He first called the attention of the house to the subject in 1787, and in 1791 moved for leave to bring in a bill to prevent further importation of

WILBERFORCE UNIVERSITY — WILCOX

African negroes into the British colonies. Year after year he pressed this measure, but was always defeated till 1807, when it was passed during the short administration of Fox. But his exertions in the cause of the slave were not over. Having secured the abolition of the slave-trade in the British colonies, he next addressed himself to the task of obtaining emancipation for those already reduced to or born in slavery. In 1812, after having sat for Yorkshire in six parliaments, he withdrew from the representation, and until 1825, when he retired from parliament, sat for the borough of Bramber. He died shortly after the government plan for the total abolition of slavery in the British colonies had passed in the House of Commons. His remains were interred in Westminster Abbey, and his funeral was attended by distinguished men of all parties. Wilberforce was the author of a treatise entitled 'A Practical View of the Prevailing Religious Systems of Professed Christians in the Higher and Middle Classes contrasted with Real Christianity' (1797). Consult: 'Life of William Wilberforce' by his sons (1838); his 'Correspondence' (edited 1840); and 'Private Papers of William Wilberforce' (edited 1897).

Wilberforce University, an institution for the education of the colored race located at Wilberforce, a suburb of Xenia, Ohio. It was founded in 1856 under the auspices of the African Methodist Episcopal Church. It includes the Collegiate Department, the Normal Department, the Payne Theological Seminary, a Law Department, the Academic Department, and Music and Commercial departments, and a Nurses' Training School. Women are admitted to all departments. The Collegiate Department offers two four years' courses, the classical and the scientific leading to the degrees of A.B. and B.S. The Theological Seminary offers a three years' course and confers the degree of B.D. A practice school is connected with the work of the Normal Department. Industrial training is not included in the curriculum; students, however, care for their own rooms. Emphasis is placed upon the development of moral character; there are few rules for behavior and government, but these are strictly enforced. The income in 1903-4 amounted to \$46,000; the grounds and buildings were valued at over \$155,000; a new dormitory was built in 1900-1; the library contained 5,000 volumes. The students numbered 408, and the faculty 24.

Wilbrandt, vil'bränt, Adolf, German dramatist, novelist, and biographer: b. Rostock 24 Aug. 1837. He was educated in Berlin and in Munich, traveled in Italy and France, and in 1871 became director of the Hofburg theatre in Vienna. He resigned his position in 1889, returned to Rostock, and has since occupied himself in literary pursuits. He wrote biographies of Heinrich von Kleist (1863), Hölderlin, and Fritz Reuter, the two last published in 'Fahr-ende Geister.' His dramas have met with great success, and among them may be mentioned: 'Der Graf von Hammerstein' (1870); 'Gracchus' (1872); 'Giordano Bruno' (1874); 'Kriemhild' (1877); etc. His novels treat with skill the social and literary problems of the day. They include: 'Adams Söhne' (1890); 'Der Dornenweg' (1894); 'Feuerblumen' (1900); 'Villa Maria' (1902); etc.

Wilbur, wil'bër, John, American preacher of the Society of Friends: b. Hopkinton, R. I., 17 July 1774; d. there 1 May 1856. He was a teacher and surveyor, who was a strongly conservative member of the Society of Friends and opposed innovations which he believed to be at variance with the original doctrine of the society. For his alleged statements reflecting on J. J. Gurney (q.v.), the English Quaker, he was denounced by several members of the Rhode Island yearly meeting of 1838. He was sustained by a large majority of his own (South Kingstown) monthly meeting; but that meeting was dissolved and its members added to the Greenwich meeting, by which he was formally disowned in 1843. This action was confirmed by the quarterly meeting and the Rhode Island yearly meeting. Wilbur's adherents then withdrew from the orthodox society in such numbers as to form an independent conservative yearly meeting whose members were styled Wilburites (q.v.). Among Wilbur's writings, largely polemical, was 'A Narrative and Exposition' (1845). His 'Journal and Correspondence' appeared in 1859.

Wil'burites, a branch of the Society of Friends, or Quakers, who adopted the principles of the Rev. John Wilbur, and maintain an independent yearly meeting. Wilbur became a preacher of the Society of Friends, and took a strongly conservative stand against what he regarded as innovations antagonistic to the original doctrines of the society. He was also accused of making unjust charges against Joseph John Gurney, the noted English philanthropist and preacher of the Society of Friends, when Gurney visited the United States. Wilbur was sustained by his own monthly meeting of South Kingstown, but that meeting was dissolved and its members added to the Greenwich meeting. The latter disowned Wilbur, and its action was confirmed, after an earnest controversy, by the quarterly meeting and the Rhode Island yearly meeting. Wilbur's followers thereupon formed an independent meeting, which in 1902 included 38 ministers, 53 churches, and 4,468 communicants. See FRIENDS, THE RELIGIOUS SOCIETY OF.

Wilcox, wil'kōks, Cadmus Marcellus, American soldier: b. Wayne County, N. C., 19 May 1826; d. Washington, D. C., 2 Dec. 1890. He was graduated from West Point in 1846, served in the Mexican War, and in 1860 was promoted captain. In 1861 he resigned from the army and entered the service of the Confederacy. He participated in the first battle of Bull Run, was promoted brigadier-general in October, and in 1863 became major-general. He was engaged in the second battle of Bull Run, at Fredericksburg, Chancellorsville, Salem Heights, Gettysburg, and other important battles, and was present at the surrender at Appomattox Court-house. He was offered a commission as brigadier-general in the Egyptian army after the close of the Civil War, but declined it. In 1886-9 he was chief of the division of railroads at the general land-office in Washington. He wrote: 'Rifles and Rifle Practice' (1859); translation 'Austrian Infantry Evolutions of the Line' (1860); and an excellent 'History of the Mexican War,' the manuscript of which was completed and published by his niece, M. R. Wilcox (1892).

WILCOX — WILDBAD-GASTEIN

Wilcox, Ella Wheeler, American poet: b. Johnstown Centre, Wis., 1855. She was educated at the University of Wisconsin and in 1884 was married to Robert M. Wilcox. She began her literary career by contributing to the periodical press, and her work has been widely read and extensively reprinted. 'Poems of Passion' (1883) is perhaps her best known work. Among her other publications, in verse, are: 'Drops of Water' (1872); 'Maurine and Other Poems' (1876); 'Poems of Pleasure' (1887); 'The Beautiful Land of Nod' (1892); etc. She has also written the novels: 'Mal Moulée' (1885); 'A Double Life' (1890); 'An Erring Woman's Love' (1892).

Wilcox, Marrión, American author: b. Augusta, Ga., 3 April 1858. He was graduated from Yale in 1878, studied in Germany, and was subsequently admitted to the New York bar. He has acted as instructor at Yale, was associate editor of the 'New Englander' and the 'Yale Review,' and since 1893 has been engaged in editorial and other literary work in New York. He has published: 'Real People' (1886); 'A Short History of the War with Spain' (1898); 'Harper's History of the War with the Philippines' (1900); etc.

Wilcox, Robert William, American legislator: b. Kūhulu, Honolulu, Hawaii, 15 Feb. 1855; d. Honolulu, Hawaii, 24 Oct. 1903. He was educated in Hawaii and at the Royal Military Academy, Turin, Italy. He was a member of the native legislature, led the revolution to restore the old constitution in 1889, and in 1895 again commanded a revolution, on this occasion for the purpose of restoring Queen Liliuokalani to the throne. He was captured and sentenced to death, but through the mediation of the United States Congress the sentence was commuted to 35 years' imprisonment and \$10,000 fine. He was pardoned, conditionally in 1896, and fully in 1898, by President Dole. He was elected a delegate to the United States Congress in 1901 and served one term.

Wild, Heinrich, hīn'rīn vīlt, Swiss meteorologist: b. Uster 17 Dec. 1833; d. Zürich 5 Sept. 1902. His education was obtained at Zürich, Königsberg, and Heidelberg, and from 1863 to 1865 he was director of the central meteorological bureau at Bern. He was called to St. Petersburg, and was director of the Russian meteorological service 1868-95, when he retired. He invented the polaristrobometer, a polarization plutometer, a magnetic theodolite, and other optical instruments, edited the Russian 'Neues Repertorium für Meteorologie,' and published 'Temperatur-Verhältnisse des russischen Reichs' (1876); and technical papers.

Wild, wild, Jonathan, English thief and informer: b. Wolverhampton, England, about 1682; d. London 24 May 1725. He was a Birmingham buckle-maker who in 1706 went to London intending to engage in his trade, but becoming involved in debt was imprisoned for four years, after which he became a receiver of stolen goods and an informer against such criminals as were not in his employ. He was hanged at Tyburn. He was the subject of Fielding's satire, 'History of the Life of the Late Mr. Jonathan Wild the Great' (1743) and also appears in Ainsworth's novel, 'Jack Shepherd,' as well as in various other tales and pretended biographies.

Wild Hunt (Ger. *Wilde Jagd*; also *Wüthen-heer*), in German folk-lore, a fancied noise in the air at night, most usually supposed to be heard between Christmas and Epiphany. The sound is compared to that of a spirit host rushing along, accompanied by the shouting of huntsmen and the baying of dogs. The root of the notion is thought to lie in the Christian degradation of the old heathen gods. Like Odin, the lord of all atmospheric and weather phenomena, and consequently of storms, the wild huntsman also appears on horseback, in hat and cloak, accompanied by a train of spirits—by the ghosts of drunkards, suicides, and other malefactors, often without heads, or otherwise mutilated. When he comes to a crossroad, he falls, and gets up on the other side. Generally he brings hurt or destruction, especially to any one rash enough to address him or join in the hunting cry, as many persons valiant in their drink have done. Whoever remains standing in the middle of the highway, or steps aside into a tilled field, or throws himself in silence on the earth, escapes the danger. In many districts heroes of the older or of the more modern legends take the place of Odin: thus, in Lusatia, Dietrich of Bern; in Swabia, Berchthold; in Sleswick, King Abel; in Lower Hesse, Charles the Great; in England, King Arthur; in Denmark, King Waldemar. The legend has also in recent times attached itself to individual sportsmen, who, as a punishment for their immoderateness or cruelty in sport, or for hunting on Sunday, were condemned henceforth to follow the chase by night. In Lower Germany there are many such stories current of one Hakkelberend, whose tomb even is shown in several places.

Another version of the wild hunt is to be found in the legend prevalent in Thuringia. There the procession, formed partly of children who had died unbaptized, and headed by Frau Holle or Holda, passed yearly through the country on Holy Thursday, and the assembled people waited its arrival, as if a mighty king were approaching. An old man with white hair, the faithful Eckhart, preceded the spirit-host to warn the people out of the way. In one form or other the legend of the wild hunt is spread over all German countries, and is found also in France, and even in Spain. In England we meet substantially the same notion in folk-lore—phantom dogs, like the black Shuck-dog of Norfolk and the Mauthe hound of Peel in Man, the "Wisht Hounds" of Dartmoor, headless horses, a ghostly coach, and horses swept along in a storm of wind. Such tales, with innumerable variants, are in fact found in the mythical and legendary records of all the older peoples.

Wild Irish Girl, The, a novel by Lady Morgan, published in 1806. It instantly became a favorite, in England went through seven editions in less than two years, and in 1807 reached its fourth American edition. The story is in the form of letters, and suffers from the consequent limitations; but the sketches of Irish life are curious and picturesque.

Wildbad-Gastein, vīlt'bād gās'tīn, Austria, a watering-place in Gastein valley, 3,000 feet above the sea, 48 miles south of Salzburg, with thermal springs varying from 64° to 100°, and containing some salt and carbonates of magnesia and lime. The place gives the name to a

WILDCAT

treaty signed here in 1865 by the emperor of Austria and the king of Prussia, the non-observance of the terms of which led to the German war of 1866.

Wildcat, any of the smaller species of feline animals (family *Felidae*, q.v.) in its feral condition; a lynx. The term is a general one applying to all the smaller felines; but locally has usually some specific application. Thus in European books and speech the "wildcat" properly and ordinarily means *Felis catus*, formerly well-known in all forested districts from the British Isles to Siberia, and still to be found in the less settled districts of the continent south of Sweden, though extinct in Great Britain, France, and Italy; it is also numerous in northern Scotland. The wildcat is larger, heavier, and more strongly built than the domestic cat (to which it has contributed little, if anything; see CAT), has a stouter head and shorter and thicker tail, which does not taper; besides other peculiarities. Its body is yellowish gray, with a dark stripe along the spine, and with numerous darkish stripes descending more or less vertically down the sides, marking the limbs transversely and forming rings around the tail. It is noted for its savagery, and thoroughly tamed examples are very rare, if any ever existed. Like most of the wild felines the female makes her nest in a hollow tree, or cleft of rocks, in an abandoned crow's nest, or some similarly convenient place, and brings forth there in early summer an annual litter of young, which show the ferocity of their native disposition from the start.

Lynxes.—The other European wildcat, and the North American wildcats, are lynxes, formerly set apart in a separate genus (*Lynx*); but most modern zoologists do not do so. "The lynxes," says Mivart, "are animals which present a markedly different aspect from that of other cats. Their legs are long, and their tail is, with one exception (that of the caracal), very short. Their ears also are tufted at the tip. The pupil is linear when contracted. The orbits are incompletely surrounded by bone. They have no tooth representing the common cat's first upper premolar, while that answering to its second upper premolar is largely developed. The intestines are also very short. . . . Still the above given characters are variable in the cat group. In some cats other than lynxes the tail is short, and some have the ears more or less penciled. Some, as we have seen, have long legs, and in many the upper premolar is wanting. The lynxes, therefore, cannot be separated off as a nominally distinct group or genus. The lynxes are very variable in their color and markings, and the Northern lynx also varies greatly in the abundance of its hair, according to the season,—the animal having a very different aspect in winter from that which it presents in summer. The Northern lynxes are generally reckoned as forming two species, one belonging to the Old World (*F. borealis*), and at least one species belonging to the New (*F. canadensis*). The American forms are often also described as alone constituting three species—namely, *F. canadensis*, *F. rufa*, and *F. maculata*. After a careful examination . . . I am, however, not only quite unable to regard the American varieties as anything more than varieties, but I am inclined to the opinion that

there can be no real specific distinctness between the Northern lynxes of the two hemispheres, their skulls as well as their skins being so much alike."

The European lynx is still found in northern Scandinavia, Russia, and eastward, and in some of the wilder mountain chains of central Europe. It is reddish gray, as a rule, indistinctly spotted or not at all, most prominently when young. A large one will measure 40 inches from the snout to the root of the short, thick tail. The lynx of northern America is very similar, the color grading from nearly uniform grizzly gray in far northern specimens which are the largest in average size, toward the reddish and yellowish, more or less spotted southern specimens, which run much smaller: these colors are always brighter in summer than in winter. The long hair depending from the cheeks is characteristic of the group, especially in old males, and gives a very grim aspect to the countenance. These variations, which are local in some of their manifestations, have led the more recent school of American zoologists, led by Merriam, to name several species and subspecies. Thus the Canadian lynx (*F. canadensis*) is not regarded as findable south of Canada, and is characterized by its long gray unspotted coat. The lynxes or "bobcats" of the United States generally are *F. rufa*, yellowish brown spotted on the sides, with dark brown, and having other markings; a subspecies (*maculata*), more profusely spotted, extends the range of the cat to the Pacific coast; and various other subspecies, distinguished by color, are found in the Gulf States and westward to Central America. All have substantially the same rapacious qualities and habits, varying with the character of the country and climate in which each variety lives, and the kind of small animals upon which they must depend for food. They are chiefly solitary and nocturnal; and soon disappear from all well-settled regions.

African and Asiatic Wildcats.—The Egyptian or gloved cat (*F. caligata*) is most interesting of the Old World wildcats, because it is the source, or main source, of our domestic races (see CAT). It inhabits northern Africa, and is about a third smaller than the European wildcat; it is yellowish, growing nearly white on the belly, and has obscure stripings on the body, limbs, and tail, which is rather long, slender, and tipped with black, while the feet are usually blackish. Another well known African cat is the large, long-legged serval (*F. serval*) which is to be found throughout the whole continent. It becomes as much as 40 inches long from nose to root of tail, and the tail may be 16 inches in length. In color it is tawny, with black spots, forming two irregular bands along the back, and black rings on the tail; its fur is a valuable commodity. Three or four other species dwell along the West African coast, as the rare red-brown "golden-haired" cat (*F. rutila*), the smaller gray, spotted, *F. neglecta*, and the more yellowish *F. servalina*, but none is well known.

Asia and the Malayan archipelago have a large number of wildcats, some of which when better known may prove to be mere local varieties of other species. The most familiar are the common Indian wildcat (*F. torquata*), which has much resemblance to the European

one, but is more slender, a brighter fulvous in tint, and less striped. Another wide-ranging species in India is the chaus, or jungle-cat (*F. chaus*), about 26 inches long to the tail, which measures 9 to 10 inches and drops to the heels. It is yellowish gray, more or less dark and unspotted, more reddish on the sides, where it unites with the lower parts; a dark stripe extends from the muzzle to the eye, and there are faint bars on limbs and tail. A very similar species, restricted to the arid plains of northern India, is the "ornate" jungle-cat (*F. ornata*). Another large East Indian cat, known from Nepal to Borneo, but nowhere numerous, is called the baycat (*F. aurata*), in reference to its bay-red color, which is unspotted and becomes whitish on the under surfaces. India also has several spotted cats, of which the best known is the widely distributed fishing-cat (*F. viverrina*), which may be 30 to 32 inches long in body, with a tail 9 to 10 inches long; it feeds mainly on fish, snails, and other mollusks, yet is noted for its fierceness, and has even been known to seize and carry away small native children. This cat is dark gray in general color, profusely spotted and striped with blackish like a civet. Smaller, more yellowish, and much spotted, is the Indian leopard-cat (*F. bengalensis*) which occurs in all parts of India and eastward to Java. Resembling it, but smaller, is the rare wagati; but more distinct and richly ornamented is the tiger-cat (*F. marmorata*), whose tawny coat is marbled or clouded with elongate wavy black lines and commingling spots. It is of small size, but has a very long spotted tail. In the jungles of southern India the sportsman encounters about grassy places a small handsome species, with slender body and head, and rather short legs and long tail, called the rusty-spotted cat (*F. rubiginosa*), which is greenish gray with white under parts, and has dark stripes and lines of small spots extending from nose to rump, and pretty white marks about the face. A similar species (*F. chinensis*) occurs in southern China and Formosa; and several others in the Malayan region. It is quite likely that future increase of knowledge and connecting specimens will bring them all under one name. In Borneo, however, occurs a very distinct little cat (*F. badia*), tinted bright chestnut, white on the breast and belly, and without markings, except a few on the face, and a streak on the long tapering tail. The flat-headed cat (*F. planiceps*) of Malacca, Sumatra, and Borneo, is another distinct form. It is about the size of a domestic cat, but the body is unusually long, the neck short and thick, the head globular and flat on top, the legs remarkably short, and the tail short and thick. Its fur is dark-brown above, each hair tipped with white, and it is spotted white on the lower parts, with yellow lines forming a V on the face. Central Asia has several notable wildcats, as the manul (*F. manul*), the steppe cat (*F. caudatus*), and Tibetan tiger-cat (*F. scripta*), all of which are handsomely striped or spotted, or both.

American Tropical Cats.—South and Central America are the home of a large variety of small felines, as well as of the puma and jaguar. Of these the most notable are the eyra, ocelot, and jaguarondi (qq.v.) elsewhere described. In addition to these are several of much local interest. The margay or chati (*F. tigrina*) is a widespread and variable species,

which is met with from Mexico to Paraguay, in warm and well-wooded lowland regions. Its fur may be a grizzly gray, or vary from that to a fox-red, profusely marked with black spots and rings, which extend along the tail, but do not form rings. There are three upright bars upon each cheek. The margay measures about two feet in length of body, and its tail about 11 inches. Geoffroy's cat (*F. guigna*) is a little known species of southern Brazil; and may turn out a variety of the colocola (*F. cololla*) of the same region, which is whitish gray with elongated spots on the face, and along the sides. The Pampas cat or straw-cat (*F. pajeros*) is a well-marked form. It is much larger and more robust than a house-cat, with short thick legs, a short, club-shaped tail, thick neck, and small head, with great round eyes and very small ears. This appearance of weight and size is largely due to the unusual length of the hair, which is yellowish gray, marked with transverse brownish bands on the body, patches on the face and rings around the tail. It inhabits the open plains of Argentina, and with similar habits has become a curious counterpart of the manul of the Asiatic steppes.

Bibliography.—Mivart, 'The Cat' (New York, 1892); Elliot, 'Monograph of the Felidae' (London 1878-83); Hamilton, 'The Wildcat of Europe' (London 1896); Blanford, 'Fauna of British India—Mammals' (London, 1888); 'Zoology of Persia' (London 1876); Blythe, 'Monograph of the Species of Lynx' (Calcutta 1846); Stone and Cram, 'American Animals' (New York 1902); and standard authorities.

Wilde, wild, George Francis Faxon, American naval officer: b. Braintree, Mass., 23 Feb. 1845. He was graduated from the United States Naval Academy in 1864 and in 1864-6 was attached to the Brazil squadron. He received promotion to lieutenant-commander in 1869, to commander in 1885, and while commanding the despatch boat Dolphin in 1885-8 made a trip around the world, the Dolphin being the first steel vessel in the United States navy to accomplish that feat. He became captain in 1898, commanded the ram Katahdin in the Spanish-American War, and later, in command of the Boston, he landed the first marine troops ever landed in China, sending them to guard the legation at Peking. He captured Iloilo in the Philippine Islands in 1899, and was placed in command of the Oregon in that year. In 1900 he captured Vigan in the Philippines, and he was in command of the Oregon when she was grounded on an uncharted ledge of rock in the Pechili Gulf. In 1901-2 he was in command of the navy yard at Portsmouth, N. H., and since 1902 has been in charge of that at Boston.

Wilde, Jane Francesca Elgee, LADY ("SPERANZA"), Irish poet: b. Wexford, Ireland, 1826; d. Chelsea, England, 3 Feb. 1896. She was married to Sir William Robert Wills Wilde in 1851. Her literary career began in 1845 with her contributions in prose and verse to the 'Nation.' The publication of her essay 'Jacta alea est,' under her pen-name "Speranza," was made the basis of the unsuccessful prosecution of the editor after the suppression of the 'Nation' in 1848. Among her writings are: 'Ugo Bassi' (1857); 'Poems by Speranza' (1871); 'An-

WILDE — WILDERNESS, THE BATTLE OF THE

cient Legends, Mystic Charms, and Superstitions of Ireland' (1887); 'Notes on Men, Women, and Books' (1891); 'Social Studies' (1893); etc.

Wilde, Oscar (Fingal O'Flahertie Wills), Irish poet: b. Dublin, Ireland, 1856; d. Paris 30 Nov. 1900. His father was Sir William Wilde, a noted surgeon, and his mother was Lady Jane Wilde (q.v.). He was graduated from Oxford in 1878, winning the Newdigate prize for English verse. In 1879 he went to live in London, where he soon became the leader of the so-called æsthetic movement and was satirized by Du Maurier as 'Postlethwaite' in 'Punch,' and by Gilbert in the opera of 'Patience.' He visited this country in 1882, lecturing extensively on art topics, and later lectured similarly in his own country and in Paris. In 1895 he was convicted of a serious moral offense and condemned to penal servitude for two years. During his imprisonment he wrote 'A Ballad of Reading Gaol,' a poem of great force. His other published works include: 'Poems' (1880); 'The Picture of Dorian Gray,' a novel; 'The Happy Prince and Other Tales' (1888); the tragedies 'Guido Ferranti' (1890), and 'The Duchess of Padua'; 'Intentions,' essays (1891); 'Lord Arthur Savile's Crimes, and Other Stories' (1891); 'Lady Windermere's Fan,' 'A Woman of No Importance,' and 'The Importance of Being Earnest'; and other comedies. His comedies are extremely clever as regards dialogue, and his poems are characterized by melody of movement and beauty of thought. A complete edition of his poems appeared in 1903.

Wilde, Richard Henry, American scholar: b. Dublin, Ireland, 24 Sept. 1780; d. New Orleans, La., 10 Sept. 1847. He came with his parents to the United States in 1797 and settled in Georgia, where he studied law, and in 1809 was admitted to the bar. He was elected attorney-general of his State and in 1815-17, 1824-5, and in 1827-35 was a member of Congress. He spent the years 1835-40 in Europe, made a special study of Dante and Tasso, and was instrumental in the discovery of a portrait of Dante by Giotto on the wall of the chapel of Bargello. He subsequently removed to New Orleans, re-engaged in law practice, and in 1844 accepted the chair of constitutional law at the Louisiana State University. He wrote the widely popular poem, 'My Life is Like the Summer Rose,' and also published: 'Conjectures and Researches Concerning the Love, Madness, and Imprisonment of Torquato Dante' (1842). His poem 'Hesperia,' edited by his son, was published in 1867.

Wilde, Thomas. See TRURO, THOMAS WILDE, BARON.

Wilder, wil'der, Alexander, American eclectic physician, author, and journalist: b. Verona, N. Y., 14 May 1823. He was graduated at Syracuse Medical College in 1850, and in 1852 began an editorial career on the Syracuse 'Star,' being subsequently connected with the Syracuse 'Journal' (1853), New York 'Teacher' (1856), and New York *Evening Post* (1858-71). He was an anti-Tweed alderman in New York in 1872, inspector of schools in 1873, and from 1875 to 1895 secretary of the National Eclectic Medical Association, editing 10 volumes of 'Transactions.' He is president

(1904) of the New York School of Philosophy. Among his published works are: 'Secret of Immortality Revealed' (1846); 'Neo-Platonism and Alchemy' (1869); 'Our Darwinian Cousins' (1873); 'Eleusinian and Bacclæic Mysteries' (1874); 'Ancient Symbol Worship' (1874); 'Serpent and Siva Worship' (1875); 'Vaccination, a Fallacy' (1879); 'Psychology as a Science' (1884); 'The Soul' (1884); 'Higher Sources of Knowledge' (1884); 'Ethics and Philosophy of the Zoroasters' (1885); 'Ancient Symbolism and Serpent Worship' (1886); 'Later Platonists' (1887); 'Antecedent Life' (1895); 'The Ganglionic Nervous System' (1900); 'Perennial Life' (1902); 'History of Medicine' (1902). He has translated and edited 'Iamblichus on Egyptian Mysteries.'

Wilder, Burt Green, American physiologist: b. Boston, Mass., 11 Aug. 1841. He was graduated from the Lawrence Scientific School at Harvard in 1862, was assistant surgeon in the Union army in 1863-5, and in 1866 was graduated from the medical department at Harvard. He was assistant in comparative anatomy at the Harvard Museum of Comparative Zoology in 1866-7, and in 1867 accepted the chair of zoology, which he still occupies, at Cornell. In 1874-84 he was lecturer in physiology at the Summer Medical School of Maine. He has made many interesting researches concerning the habits of the spider, and since 1880 has spent much time in an endeavor to secure a simple anatomic nomenclature. In 1885-6 he was president of the American Neurological Association. He has written numerous professional papers, and has published in book form: 'What Young People Should Know' (1875); 'Health Notes for Students' (1883); 'Physiology Practicums' (1895); etc.

Wilder, Marshall Pinckney, American horticulturist: b. Rindge, N. H., 22 Sept. 1798; d. Boston, Mass., 16 Dec. 1886. He was engaged as a merchant in the West India trade at Boston after 1825, in 1839 was chosen to the State legislature, was president of the State senate in 1850, and in 1849 served as member of the Executive Council. He was prominent in the organization of the Constitutional Union Party, was a delegate to the convention which nominated Bell and Everett in 1860, and throughout the Civil War was a firm supporter of the Union. He founded the Massachusetts Agricultural Society, the Massachusetts Agricultural College, and was active in the movement which resulted in the establishment of the Massachusetts Institute of Technology. He was author of numerous articles on horticulture, and lectured extensively on the subject. Among his published addresses may be mentioned 'The Hybridization of the Camellia and Its Varieties' (1847).

Wilder, Marshall Pinckney, American professional entertainer: b. Geneva, N. Y., 19 Sept. 1859. His occupation was at first that of a stenographer, but he abandoned it in order to become a drawing-room entertainer, in which capacity he has been widely popular. He has published 'People I've Smiled With.'

Wilderness, The Battle of the. On 9 March 1864 President Lincoln handed to Gen. Grant his commission as lieutenant-general, and two days later placed him in command of all the

WILDERNESS, THE BATTLE OF THE

armies of the United States. Grant made immediate preparations for an early campaign to be conducted simultaneously, east and west. He made his headquarters with the Army of the Potomac. Before coming to the East he had expressed himself as favoring a coast movement, south of James River, and an advance on Richmond on that line. After his arrival at Washington and a study of the problem he proposed to act with the Army of the Potomac on what was known as the overland route from the Rapidan to the James, while Gen. Butler, with 30,000 men, should ascend James River from Fort Monroe, and establish himself in an intrenched position near City Point, whence he could operate against Richmond and its communications with the south, and at a proper time form a junction with the Army of the Potomac, moving down from the north. At the same time Gen. Sigel, commanding troops in West Virginia and the Shenandoah Valley, was instructed to form two columns, one of 10,000 men, under Gen. Crook, to move from the Kanawha and operate against the Virginia and East Tennessee Railroad, the other 7,000 strong, under Sigel, in person, to advance, as far as possible, up the Shenandoah Valley, to draw detachments from Lee. Grant's main reliance, however, was the Army of the Potomac, which, 30 April 1864, was composed of the Second, Fifth and Sixth corps of infantry and a cavalry corps, commanded respectively by Gens. W. S. Hancock, G. K. Warren, John Sedgwick, and P. H. Sheridan. The Ninth corps, Gen. A. E. Burnside, united with the Army of the Potomac on 6 May, but acted under the immediate orders of Gen. Grant, until the 24th, when it became a part of the Army of the Potomac. The strength of the army, including the Ninth corps, 30 April, was 118,760 officers and men, with 316 guns. The army was commanded by Gen. George G. Meade. Formed in battle line, two ranks deep, with one third in reserve, it would cover a front of 21 miles. Its train of 4,000 wagons was 65 miles long. The assigned duty of this army was to attack the Army of Northern Virginia, and by constant hammering destroy it and take Richmond. The Army of Northern Virginia, commanded by Gen. R. E. Lee, was composed of the First, Second and Third infantry corps, commanded by Gens. J. Longstreet, R. S. Ewell, and A. P. Hill. A cavalry corps of two divisions (Wade Hampton's and Fitzhugh Lee's) was commanded by Gen. J. E. B. Stuart. The most reliable estimate gives Lee's strength, present for duty, on 1 May 1864, as 48,700 infantry, 4,854 artillery, and 8,399 cavalry, an aggregate of 61,953 officers and men, with 224 guns. On 1 May the Army of the Potomac was encamped in the vicinity of Culpeper Court House, between the Rapidan and the Rappahannock, and the Ninth corps on the railroad from Manassas Junction to the Rappahannock. Lee's army lay south of the Rapidan. Ewell's corps above Mine Run, and A. P. Hill's on Ewell's left, higher up the Rapidan. Longstreet's corps was near Gordonsville. Stuart's cavalry lay along the lower Rappahannock. Lee's headquarters were near Orange Court House, 70 miles from Richmond. Lee's army being the first objective, it was finally determined to cross the Rapidan, turn his right and compel him to fall back toward Richmond or come out of his intrenchments and give battle on open ground.

The principal objection to this movement was the difficulty presented by the Wilderness, a forest of unusually dense growth, with an almost impenetrable undergrowth, where infantry could pass with great difficulty, and where cavalry and artillery could not be used. It was thought to avoid this difficulty by moving at night, crossing the Rapidan and getting through the Wilderness before Lee could discover the movement and intercept it by moving on the Orange turnpike and Orange plank road. These two roads lead from Orange Court House down the Rapidan toward Fredericksburg. They follow the general direction of the river and are almost parallel to each other; the turnpike nearest the river and the plank road a short distance south of it. Grant's proposed route lay directly across these two roads along the western borders of the Wilderness. The movement began at midnight of 3 May. Hancock's Second corps, preceded by Gregg's cavalry division, crossed the Rapidan at Ely's Ford and moved to Chancellorsville, where the entire corps with its trains had arrived by noon of the 4th. Warren's corps, preceded by Wilson's cavalry division, crossed the river at Germanna Ford and marched to Wilderness Tavern, at the intersection of the Germanna road by the Orange turnpike. It reached its position by 2 p.m. of the 4th. Wilson's cavalry was thrown forward to Parker's Store on the Orange plank road. Sedgwick's Sixth corps followed Warren's across the Germanna Ford and halted a short distance beyond it. The crossing of the river was very gratifying to Grant who regarded it as a great success, and it removed from his mind the most serious apprehension he had entertained "that of crossing the river in the face of an active, large, well-appointed and ably commanded army, and how so large a train was to be carried through a hostile country and protected." At noon of the 4th Grant knew that Lee was aware of his movement, upon which he sent a despatch to Burnside to make a forced march from beyond the Rappahannock to Germanna Ford, and by the morning of the 5th his advance was crossing the Rapidan. The orders for the 5th were for Sheridan, with two divisions of cavalry, to move against the Confederate cavalry, near Hamilton's crossing, and at 5 a.m. Wilson's cavalry division was to move to Craig's Meeting House, and reconnoitre the Orange pike and plank roads, and other roads on his right and left. Hancock's Second corps was to march from Chancellorsville to Shady Grove Church and extend its right toward Parker's Store, on the Orange plank road, to which point Warren's corps was ordered to advance from Wilderness Tavern. Warren, in turn, was to extend his right toward Sedgwick's Sixth corps, which was ordered to Wilderness Tavern. Gen. Lee interfered with the full execution of these orders. He had been expecting Grant to move on his right and when he saw on the morning of the 4th that the movement was being made, determined to attack him before he could get out of the Wilderness and ordered Ewell to march by the Orange pike and A. P. Hill down the plank road, and that night Ewell bivouacked within five miles of Wilderness Tavern, and Hill's advance division halted for the night at Mine Run, seven miles from Parker's Store, on the plank road, and about ten from the intersection of the Brock road. Longstreet moved from near Gordonsville at 4 p.m. Stuart's cavalry was

WILDERNESS, THE BATTLE OF THE

drawn in and ordered to cover the Confederate right. On the morning of the 5th Ewell continued his march on the Orange pike, under instructions to regulate his march with that of A. P. Hill, on the plank road, and both informed that it was not desired to bring on a general engagement before Longstreet came up, who was under orders to follow Hill on the plank road. When Ewell was two miles from the Wilderness Tavern, he halted, as he was three or four miles farther advanced than Hill. Warren had discovered that the Confederates, under Ewell, were in force two miles beyond Wilderness Tavern and before 7 A.M. had informed Meade of the fact, who ordered Warren to make an attack with his whole force. Sedgwick was directed to move up by a cross road, attack the enemy and connect with Warren on the turnpike, and a despatch was sent to Hancock, informing him of what had become known and directing him to halt at Todd's Tavern, until further developments. Warren had started early in the morning for Parker's Store, on the Orange plank road, and when near it Crawford's division had been ordered to halt in a good position on high ground, and finding that Wilson's cavalry at Parker's Store needed assistance Crawford threw forward a skirmish line that encountered the flankers of A. P. Hill's corps. Soon after 8 A.M. Crawford was informed by Warren that Griffin's and Wadsworth's divisions would attack Ewell on the turnpike and he was ordered to join in it with one of his brigades. Between 9 and 10 A.M. Hancock was ordered to move up the Brock Road to the Orange plank road and be prepared to move out that road toward Parker's Store, and about the same hour three brigades of Gen. Getty's division of Sedgwick's corps were ordered from the Wilderness Tavern to the intersection of the Brock road with the Orange plank road, and directed to move out the latter road and attack the enemy, and, if they could, drive them back beyond Parker's Store. As described by Humphreys, "The Brock road begins on the Orange pike about a mile east of the old Wilderness Tavern, and runs in a southeast direction to Spotsylvania Court House, intersecting the Germanna plank, the Orange plank, the Furnace, the Catharpin and other roads running in a southwest and south direction." Ewell had formed for battle across the Orange pike when about noon Warren opened the attack. Griffin's division advancing on both sides of the pike struck Johnson's division, broke it and drove it back. Rode's division was thrown in on Johnson's right, south of the pike, and supported by Early, who was formed across the pike, the line was re-established. After a severe and bloody fight Griffin was driven back, losing many prisoners and two guns. Wadsworth's division which had advanced on the left of Griffin, lost direction, exposed its left, and was thrown back in confusion. McCandless' brigade of Crawford's division, attempting to unite with Wadsworth's left, was nearly surrounded by Ewell's right and fell back with heavy losses, and Crawford's entire division had to be drawn in. Thus all the ground gained by Warren was given up and he assumed a new line somewhat in rear, but still in front of Wilderness Tavern, with his right on the Orange pike. He had lost more than 3,000 men. On his right Gen. Wright's division of Sedgwick's corps came up early in the afternoon, and with Neill's brigade

of Getty's division formed within 300 yards of Ewell's front, and repulsed one of his attacks. Soon after this Seymour's brigade of Rickett's division came up on the right of Neill, and about 5 P.M. two brigades of Sedgwick attacked Ewell's left and were repulsed. Meanwhile Gen. Getty, who had arrived at the crossing of the Brock road and the plank road, had been ordered to attack. Heth's Confederate division was in his front supported by Wilcox's. Hancock, who had been ordered from Todd's Tavern, 10 miles distant, by the Brock road, was instructed to support Getty, drive A. P. Hill beyond Parker's Store and connect with Warren's left. It was 3.15 P.M. when Getty received his order to attack. Meanwhile Hancock's advance had arrived and began intrenching on the Brock road. At 4.15 Getty advanced to the attack through the thick woods, and had gone less than 400 yards beyond the Brock road, when he became hotly engaged with Heth's division. Although Hancock had not completed his dispositions he moved forward to Getty's support and the fight became fierce and deadly at very close quarters, and continued until near 8 P.M., when darkness put an end to the fierce contest. Hancock had not gained much ground, but Hill's lines had been broken, and his right driven back by two brigades of Barlow's division. While Hancock and Getty were engaged, Wadsworth's division had been ordered in a southeast direction to strike the flank of the Confederates engaging them, but did not become seriously engaged and was halted by darkness, about a half mile from the Brock road. The Union army had fought in detachments, with no connection of its corps or divisions. Grant said that he had never seen such hard fighting, but prepared to renew it next day, and Hancock, Warren and Sedgwick were ordered to attack at 5 o'clock next morning, and Burnside was ordered to have two divisions in position between Warren and Hancock so as to advance with them. Each corps commander was advised of the instructions given to the others. To note briefly the action of the cavalry on the 5th: Wilson's division, after leaving 500 men at Parker's Store had proceeded toward Craig's Meeting House, on the Catharpin road, and was driven back on that road as far as Todd's Tavern. Gen. Gregg had found nothing at Fredericksburg, but had discovered two brigades of cavalry falling back from Hamilton's Crossing to Lee's right flank, and fell back to Todd's Tavern before 3 P.M. to check the enemy pursuing Wilson, and drove them back beyond Corbin's bridge.

During the night of the 5th Ewell's and Hill's corps strengthened their intrenchments and put artillery in position, and a few minutes before 5 A.M. of the 6th opened the second day's fight by an attack upon the Union right, which was promptly met by the advance of Wright's division of the Sixth corps, which made two vigorous assaults against the Confederate left, which were repulsed with severe loss. Warren made several attacks on Ewell's right which were repulsed. These persistent and unsuccessful attacks were continued until after 10 o'clock, when Sedgwick and Warren were directed to suspend them, to strengthen their intrenchments and throw up new works, in order that a part of their troops might be available for an attacking force to move from the vicinity of Hancock's right, which had been desperately en-

WILDERNESS, THE BATTLE OF THE

gaged. Hancock had disposed Gibbon's and Harlow's divisions, both under command of Gen. Gibbon, to defend his left flank against an apprehended attack by Longstreet, and at 5 A.M. launched Birney's, Mott's and Getty's divisions, all under Gen. Birney, along the Orange plank road, Wadsworth's division of Warren's corps at the same time advancing on Birney's right. They fell upon Heth's and Wilcox's divisions of Hill's corps with great fury and after a desperate contest broke them and drove them a mile and a half, through the dense woods, under heavy loss, and back on the trains and artillery, and Gen. Lee's headquarters. Just before Hill's troops gave way the head of Longstreet's corps, which had marched nearly all night, came upon the field at Parker's Store, and was hastened along the plank road to relieve the divisions of Heth and Wilcox. Kershaw's division was in the lead and began to form on the right of the road. Humphreys says: "The advance through the forest, undergrowth, and swamps more than a mile, in a hot contest, had separated and disordered Hancock's corps, and Birney's left, met in this condition by Kershaw's division, was not only brought to a standstill, but at some points swayed back and forward, until at length Kershaw, himself leading his division, forced Birney's left back as far as his centre. Wadsworth's advance had crowded many of Birney's troops to the south side of the plank road, so that the greater part of his, Birney's, command was on the left of that road. Field's division of Longstreet's corps following close on Kershaw's division, some of it coming on the ground at double-quick, was formed on the Confederate left of the plank road, and, advancing, at once became hotly engaged with Birney's right and Wadsworth's troops, Gregg's Texans and Benning's Georgians in the lead, bearing the brunt of the fight and losing heavily in killed and wounded. R. H. Anderson's division of Hill's corps, following Field's division, formed on the same part of the line, one portion uniting with Field's troops in the attack, the other portion supporting. It was when Hancock's troops were partially checked by the fresh troops of Longstreet that the necessity of readjusting his formation became imperative. Regiments were separated from their brigades and mixed with others, and the line of battle was very irregular, and commanders were in this way losing the control of their troops. This was about half past six o'clock." At 9 A.M. Hancock again attacked with the divisions of Birney, Mott, Wadsworth, Stevenson's of Burnside's corps, and three brigades of Gibbon's division and though fighting furiously made no headway, and at 11 o'clock the firing on his front died away. Meanwhile Longstreet had discovered that Hancock's left extended but a short distance from the plank road and he moved a part of his command to the right to attack Hancock's left and rear, the flank movement to be followed by a general advance of his entire corps. The attack first fell on the left of the advanced line held by Frank's brigade, partly across the Brock road, which was fairly overrun and brushed away; it then struck the left of Mott's division, which in turn was driven back in confusion to the Brock road, and the confusion spread to the troops on the right, and Hancock was compelled to withdraw his entire corps to the Brock road from which

they had advanced in the morning, where they were re-formed in two lines behind their intrenchments. Wadsworth, on the right of Hancock, made heroic efforts, but his troops broke, and while striving to rally them he was mortally wounded and died within the Confederate lines next day. When this movement had succeeded Longstreet ordered a general advance, and while riding at the head of column, moving by the flank down the plank road, when opposite the force that had made the flank movement, which were drawn up parallel with the road, about 60 yards from it, a volley was fired which killed Gen. Jenkins, commanding the leading brigade of Field's division, and severely wounded Gen. Longstreet. Gen. Lee soon came up, postponed the attack to a later hour and extended his line so that its right rested on the unfinished Orange Railroad. Meanwhile a brigade of the Ninth corps, which had been sent to the left, under Gibbon, swept down in front of Hancock's line from left to right and cleared it of the enemy. In the action of the previous day there had existed an interval between Warren on the turnpike and Hancock on the plank road, through which Burnside was expected to advance and attack Hill and Longstreet in flank, but in advancing through the woods the enemy was encountered on a wooded crest near the plank road. An attack was not deemed advisable and Burnside's troops were moved farther to the left. It was not till afternoon and after Hancock's repulse that they became engaged, without accomplishing much, and toward evening they fell back and intrenched. The lull that had followed the successful attack of Longstreet gave Hancock time to re-establish his position, now strengthened by fresh troops sent by Gen. Meade, and Hancock was directed to renew the fight at 6 P.M. But again Lee anticipated the Union commander, and at 4.15 P.M., having gotten well in hand the troops of Longstreet and Hill, he advanced in force against Hancock's intrenched lines, until he came within 100 yards of the front one, when he opened a severe fire, which was heaviest on Hancock's left, and at the end of half an hour a portion of Mott's division and of a brigade of Birney's gave way in disorder. The moment this break occurred the Confederates pushed forward and Anderson's brigade of Field's division took possession of that part of the first line of intrenchments and planted their colors on them. Near the point where the line was broken through a fire had, during the afternoon, sprung up in the woods, and at the time of Lee's attack had communicated to the log breastworks on that part of the line. At the critical moment they became a mass of flames, which could not be extinguished and which extended for many hundred yards to the right and left. The heat and smoke were driven by the wind into the faces of the Union troops, preventing them on portions of the line from firing over the parapet, and at some points obliged them to abandon it. It was this condition of affairs that permitted Anderson's brigade to seize a part of the breastworks, from which they were quickly driven by Carroll's brigade, which was near at hand and which rushed upon them at the double-quick. By 5 P.M. Lee's troops had been completely repulsed in Hancock's front, and fell back with heavy losses in killed and wounded. Just before dark Ewell moved two brigades of Early's division around

the right of Sedgwick's corps, held by Ricketts' division, and in co-operation with the rest of Early's division, succeeded in forcing Ricketts back in some confusion, capturing Gens. Shaler and Seymour, brigade commanders, and a large number of their men. Wright's division, also, was thrown into some disorder but Wright restored order and Early drew back and formed a new line in front of his old one. During the night an entirely new line was taken up by the Sixth corps, its front and right thrown back, a change which was conformed to by the right of the Fifth corps. On the left Sheridan's and Stuart's cavalry had some severe fighting at and near Todd's Tavern (q.v.) in which Sheridan had the advantage. On the morning of the 7th reconnaissances were made of the Confederate position which was found well intrenched, neither commander showed any disposition to renew the fight on that field, and Grant decided to continue the movement by the left flank, and when darkness came the Union columns began their march for Spottsylvania Court House (q.v.). The Union troops engaged numbered about 101,000; the Confederates numbered about 60,000. The Union losses, as officially reported, were 2,246 killed, 12,037 wounded, and 3,383 missing, an aggregate of 17,666. The Confederate reports are very incomplete; the most reliable estimate places their entire loss at 7,750.

E. A. CARMAN.

Wilderness Route, in American history, a famous emigrant road or trail from the Atlantic seaboard to Ohio through Cumberland Gap. Thousands of emigrants passed over this road to Ohio and Kentucky. The "Wilderness Road" was marked out by Daniel Boone. In 1775 the Transylvania Company, with Colonel Richard Henderson as head, engaged Boone to mark out a road from Fort Wautaga, on a branch of the Holston, to the Kentucky River, where the company's newly-purchased lands lay. "This I accepted," wrote Boone, "and undertook to mark out a road in the best passage through the wilderness to Kentucky with such assistance as I thought necessary to employ for such an important undertaking."

Wildes, Frank, American naval officer: b. Boston, Mass., 17 June 1843; d. on steamer China, off San Francisco, Cal., 6 Feb. 1903. He was graduated from the United States Naval Academy in 1863, served in the West Gulf squadron, and later on the monitor Chickasaw. He was promoted master in 1866, became commander in 1880, was in charge of the Portsmouth, N. H., navy yard in 1885-8, and in 1894 was commissioned captain. He commanded the cruiser Boston at the Asiatic Station in 1895-8, and served under Dewey at the battle of Manila, 1 May 1898. In 1901 he was advanced to the grade of rear-admiral, was assigned to the Asiatic Station as junior squadron commander, and in 1903 was ordered home on sick-leave, but died on the way.

Vol. 16-55

Wildfowl, in modern usage water-birds, as ducks, geese, and swans, pursued by gunners for sport or for market. American methods of wild fowling will be found given where these birds are described (see DUCK, etc.) An interesting method in Europe, still extensively pursued in some parts of England, at the Fens, is by decoying wild ducks in large trap-ponds. The pond is constructed in a secluded place, well sheltered by trees, and with a plentiful supply of reeds and sedges. From this pond pipes or narrow passages are led, 60 to 80 yards, gradually narrowing toward the termination. Above, the pipe is bridged and covered by a light network, and at its termination it ends in a tunnel net, which is, as a rule, carried out on to the land. Decoy ducks, which come to be fed at the call of the attendants, are used to entice their wild neighbors into the pipe; but the decoy dog is perhaps a more valuable ally of the fowler. This dog is named a "piper." It is of a small breed, and indulges in playful gambols by the side of the pipe, appearing now and then in advance of the fowl, which, led by curiosity, swims onward toward the dog, and is thus drawn toward the terminal net. The dog preserves a perfect silence during its maneuvers. The basins named flight-ponds consist of sheets of water of limited extent, guarded by nets so placed as to entrap such birds as the poacher as they rise from the water. Devices of the same character are used in the Orient, especially in Japan. Another Old World method is by employing the stalking horse, still used in some parts of England; the body of the horse—which requires special training for its work—being used to conceal the sportsman from the game. Consult: Sanford and Van Dyke, 'Water Fowl,' American Sportsman's Library (New York 1903); Grinnell, 'American Duck-shooting' (New York 1901); Elliot, 'The Wild Fowl of the United States, Etc.' (New York 1898); Mayer, 'Sport with Rod and Gun' (New York 1892); Aflalo, 'Sport in Europe' (London 1901); Morris, 'British Game Birds and Wildfowl' (London 1891); Bryden, 'Nature and Sport in South Africa' (London 1897); Lloyd, 'Game Birds and Wild Fowl of Sweden and Norway' (London 1867); and the writings of many sportsmen.

Wiles, wily, Irving Ramsey, American artist: b. Utica, N. Y., 1861. He studied art in New York under Beckwith and W. M. Chase, and in Paris under Carolus Duran, 1882-4. He has since resided in New York. He gained a gold medal at the World's Columbian Exposition in 1893, as well as at the Pan-American Exposition in 1901, and a medal at the Paris Exposition in 1900. He excels in both oils and water colors, and among paintings by him are his well known portrait 'My Father and Mother' Memories (1891), and 'Girl in Black.' Beside portrait and figure painting, he has done much illustrating for periodicals.

Wiley University, an institution for the education of the colored race, located in Marshall, Texas. It was founded in 1873 by the Freedmen's Aid and Southern Educational Society of the Methodist Episcopal Church, by which it is now chiefly supported. It is open to both men and women. It has elementary, secondary, and collegiate departments, and normal,

WILFRID — WILKES

commercial, and industrial courses. The Collegiate Department confers the degrees of A.B. and B.L. Industrial work and instruction is given in carpentry, bricklaying, printing, and sewing and cooking. The grounds and buildings in 1903-4 were valued at \$40,000; a building for general purposes was erected in 1900-1. The income in 1903 amounted to \$16,000; the library contained 5,280 volumes; the students numbered 502, and the faculty 22.

Wilfrid, or Wilfrith, Saint, Anglo-Saxon prelate: b. about 634; d. Oundle, Northamptonshire, 709. He studied at Lindisfarne, became a monk and in 653 accompanied Benedict Biscop to Rome in order to obtain an authoritative answer to the question of the proper time for celebrating Easter. On his return he obtained from Alchfrid, king of Northumbria, a grant of land and a monastery at Ripon, and here he was ordained priest in 664. In this same year he took a leading part in the conference at Whitby, where he persuaded the king to decree that, in the celebration of Easter, the Roman usage should be substituted for that of the Scottish Church, which had hitherto prevailed in Northumbria. At this time also the king appointed him archbishop of York, but having gone to France to be consecrated by a bishop holding orthodox views on the Easter question, he found on his return that his see was occupied by one of the opposite party, and he did not get possession till 669. Becoming obnoxious to King Egfrid (who had succeeded Alchfrid in 670), the king, to reduce his influence, divided his diocese into three, and when Wilfrid opposed this proceeding, deprived him of his see altogether (678). Wilfrid thereupon set out for Rome to obtain from the pope a reversal of the king's act of deposition. Having been driven by a storm on the coast of Friesland, he preached to the people (who had no difficulty in understanding the Anglo-Saxon) with such effect that all the princes and many thousands of the people offered themselves for baptism. Having reached Rome he easily obtained from the pope the desired decision, but during the reign of Egfrid remained under persecution or in exile; in 687, however, Aldfrid, who had succeeded Egfrid, reinstated him. But Aldfrid also in course of time was offended by his devotion to Rome, and Wilfrid was again deposed in 691. He then made another journey to Rome, and did not return till 705. Consult: Eddis, 'Vita Wilfridi,' in 'Historians of York,' Vol. I. 'Rolls Series'; Bright, 'Early English Church History' (3d ed. 1897); Hunt, 'The English Church from its Foundation to the Norman Conquest' (1899).

Wilhelm Meisters (vīl'hēlm mīs'tērz) **Apprenticeship**, a novel by Goethe. The first part was published in 1796, after having occupied Goethe's attention for 20 years; its sequel, 'Wilhelm Meisters Wanderjahre' (travels) appeared 1821-9. The central idea of this great work is the development of the individual by means of the most varied experiences of life. There is no plot proper, but in a series of brilliant episodes the different stages of the hero's spiritual growth are brought before the reader. Wilhelm Meister is a young man with many admirable qualities of character, but passionate and emotional, somewhat unstable, lacking reflection and proper knowledge of the world.

The book gives a richly colored picture of the life of Goethe's time.

Wilhelmina I., vīl'hēl-mē'nā (Wilhelmina Helene Pauline Marie), queen of the Netherlands: b. The Hague 31 Aug. 1880. She is the daughter of King William III. of the Netherlands by his second wife, Emma of Waldeck. She became queen on the death of her father in 1890, but as she had not attained her majority her mother ruled as queen-regent; Wilhelmina meanwhile was carefully educated under the best tutors. Shortly after her 18th birthday, on 6 Sept. 1898, she was crowned queen at Amsterdam. Her charming personality and strength of character have made her very popular with her people; she has also been strongly influenced by her mother, who is equally well loved by the people. In February 1901 she was married to Henry Frederick, Duke of Mecklenburg-Schwerin.

Wilhelmshaven, vīl'helms-hā-fēn, Germany, town and naval station, on the northern coast of the duchy of Oldenburg, at the west entrance of the Bay of Jade; 40 miles northwest of Bremen, with which it is connected by rail. In 1853 the land was bought from Oldenburg by Prussia, and the town laid out in 1856; it was first used as a naval station in the Franco-Prussian war, and since then has been made a fortress of the first rank. The harbor and fortifications have been built at great cost, as the ground is soft and marshy, and without natural advantages. The harbor basin, which is artificially constructed and walled with granite, is connected with the bay by a canal, and contains three large dry docks; it is defended by forts and provided with a torpedo station. The naval workshops are located here and naval stores are kept here. There is also a commercial harbor connected with the naval harbor, but the town has not yet attained any commercial importance. Pop. (1900) 22,570.

Willibrord, wīl'ī-brōrd, or Willibrod, Saint, English missionary, called the apostle of the Friesians: b. Northumbria about 657; d. about 738. He was brought up in St. Wilfred's monastery at Ripon, spent 13 years in Ireland, and at 33 with several associates embarked as a missionary for Friesland, where he was warmly welcomed by the Franconian prince Pepin. Willibrord made two visits to Rome (692 and 695), and on the latter occasion was made bishop by Pope Sergius over all the converted Friesians. In that part of Friesland under the rule of the Franks, he founded many Christian churches, some of which were destroyed a few years later in consequence of the successes of the pagan Friesians. He was buried in the monastery of Echternach, near Treves, and is commemorated in the Roman Catholic Church on 7 November.

Wilkes, wīlks, Charles, American naval officer and explorer: b. New York 1798; d. Washington 8 Feb. 1877. He entered the navy as a midshipman in 1818, served on the Mediterranean Station in 1819-20, in the Pacific, 1821-3, and was then selected for separate command. In 1826 he was promoted lieutenant, and in 1830 was appointed to take charge of the government charts and instruments. In 1838 he was put in command of an expedition for exploring and surveying the Southern seas, the first scien-

WILKES — WILKES-BARRE

tific expedition ever fitted out by the United States government. During the next five years the expedition visited Madeira, Rio de Janeiro, Terra del Fuego, Chile, Peru, the Paumotu group, Tahiti, Tutuila and the Samoan group, New South Wales, the Antarctic regions, New Zealand, the Fiji group, the Sandwich (Hawaiian) Islands, the Columbia River, Willamette Valley, the coast of California, the Philippine Islands, Sulu archipelago, Saint Helena, Singapore, and the Polynesian Islands. The results of the expedition were published in 19 Volumes, those on 'Hydrography' and 'Meteorology' being written by Wilkes himself, who also wrote the 'Narrative of the United States Exploring Expedition' (1845). Wilkes claimed to have discovered an Antarctic continent, but the claim has been disputed. In 1843 he was made commander, in 1855 a captain, and at the beginning of the Civil War in 1861 was placed in command of the San Jacinto, in which he went to the West Indies in search of the Confederate vessel Sumter. On 8 November of that year he took the Confederate commissioners Mason and Slidell from the British mail steamer *Trent*. (See TRENT AFFAIR, *TUE.*) In 1862 Wilkes was in command of the Potomac flotilla, and afterward of the flying squadron that operated against blockade-runners. In July 1862 he was promoted commodore, in 1864 was placed on the retired list, and thereon in July 1866 became rear-admiral. Besides those above mentioned his publications are: 'Western America, Including California and Oregon' (1849); and 'The Theory of the Wind' (1855).

Wilkes, John, English politician: b. London 1727; d. December 1797. He was the son of a wealthy distiller, and was educated at the University of Leyden. In 1757 he was returned to Parliament as member for Aylesbury and in 1762 attained considerable reputation by the publication of a paper entitled the 'North Briton,' in which the administration of Lord Bute was severely attacked. These papers hastened the resignation of Lord Bute, April 1763, and the same month the 'North Briton' commented on the king's speech in such caustic terms that a prosecution was determined upon. Wilkes, among others, was apprehended; but he asserted the illegality of the warrant, and refusing to answer interrogatories, was committed to the Tower. Some days after, he was brought by writ of habeas corpus before the court, and was ordered discharged on the ground that his privilege as a member of Parliament had been violated. On the next meeting of Parliament, however, a special law was passed to sanction Wilkes' prosecution, and in January 1764 he was expelled from the House of Commons. A second charge was also brought against him for printing an obscene poem, entitled an 'Essay on Woman,' and he was found guilty of blasphemy as well as libel. As he had by this time withdrawn to France and did not appear to receive sentence, he was outlawed. He made vain attempts to procure the reversal of his outlawry; but trusting to his popularity ventured to return on a change of ministry (1768). He was elected to Parliament for Middlesex, but before he could take his seat was committed to prison to fulfil the sentences previously passed upon him, and not long after was expelled from the House for an alleged libel upon the secretary of state and

secretary at war. Three times after this he was re-elected within a few months, but the House of Commons persisted in keeping him out, and after the third election the other candidate, although he had got but a small minority of the votes, was declared duly returned. In 1770 he was released from his imprisonment. He was now more than ever the idol of the people. He was elected alderman of London, sheriff of Middlesex, and finally mayor (1774). In 1774 he was again elected to Parliament for Middlesex, and allowed to take his seat, which he held till 1790. His last triumph was obtained in 1782, when the resolutions respecting the disputed Middlesex election were ordered to be expunged from the journal of the House of Commons. From the year 1779 he was chamberlain of the city of London. Wilkes, as a writer and speaker, did not reach beyond mediocrity. His private character was very licentious, but he possessed elegant manners, fine taste, ready wit, and pleasing conversation. His 'Letters and Speeches' were published by himself in 1786; and much light is thrown upon his conduct by the 'Letters from the Year 1774 to the Year 1796 to His Daughter' (1804). His correspondence was also published (1805), with a memoir by Almon. Consult: Fitzgerald, 'The Life and Times of John Wilkes, M.P.' (1888).

Wilkes-Barre, Pa., county-seat of Luzerne County, and regarded as the most beautiful town in the State; on the north branch of the Susquehanna River, and on the Central railroad of New Jersey, the Wilkes-Barré and Eastern, the Delaware and Hudson, the Wilkes-Barré and Hazleton, the Delaware, Lackawanna and Western, the Lehigh Valley, the Lackawanna and Wyoming Valley, and the Pennsylvania railroads; 145 miles northwest of Philadelphia, and 176 miles northwest of New York city. It was first settled in 1769 by New England people, mainly from Connecticut, under the auspices of The Susquehanna Company, and was named in honor of John Wilkes and Isaac Barré (q.v.), members of the British Parliament. During the Revolutionary War the settlers were, with few exceptions, loyal to the patriot cause. July 3, 1778, the male inhabitants of Wyoming Valley, who were assembled at Forty Fort to repel an invading foe, were attacked near the fort (on Abraham's Plains, some seven miles from Wilkes-Barré) by a battalion of British Rangers with their Indian allies, and were badly defeated. The Wyoming Monument, erected near the field of battle, commemorates the valor of the Americans who fought on this bloody field. Following the surrender of Forty Fort, on July 4, 1778, Wilkes-Barré was almost wholly destroyed by the enemy. Wilkes-Barré was, in the period of 1769 to 1784, the center of the controversy between Connecticut and Pennsylvania, each State claiming territorial jurisdiction over the Wyoming region (see Pennsylvania: History), and was the scene of several conflicts during that controversy, being almost entirely destroyed by fire at one time in 1784. It was gradually rebuilt and was incorporated as a borough in 1806; its growth has been rapid since the Civil War; and in 1871 it was incorporated as a city. It is situated near the center of Wyoming Valley (q.v.), in the midst of picturesque scenery. Wilkes-Barré is the birth-place of the anthracite coal-mining industry. It was here the dis-

covery was made that there existed on this continent such a mineral as anthracite (or "stone coal" as it was early called). Here anthracite was first used for fires in naileries and blacksmiths' shops; and was thus used for upward of 20 years before the existence of anthracite in any part of Pennsylvania save Wyoming Valley was known. Here anthracite first came into use as a fuel for domestic purposes. Wilkes-Barré lies in the Seventh Anthracite Mining District of Pennsylvania, and from the 37 mines and washeries in operation in the district in 1903 there were produced 4,926,473 long tons of coal. The manufacturing and mechanical industries of the city are also large; the census for 1900 reported 438 establishments, with a combined invested capital of \$10,501,537. Among these, silk and lace mills, axle-works, foundries and machine shops, and wire-rope works are the most important. The city also contains breweries, manufactories of cotton goods, and the Lehigh Valley railroad shops. There are three national banks, and six savings banks and trust companies working under State charters. The city is well built and has a public square containing four acres and a park ("The River Common") containing 35 acres along the river front. In the vicinity of the city are the Wyoming Monument, already mentioned, the old Forty Fort Church, Harvey's Lake (the largest lake in Pennsylvania) and other points of historic interest. The notable public buildings are the city hall, courthouse, jail, post-office, armory of the Ninth Regiment, N. G. P., and Memorial Hall. The city has a number of charitable institutions, including two hospitals — one the City Hospital, and the other Mercy Hospital (under the management of the Roman Catholics); a Home for Friendless Children, and a Home for Homeless Women. It has 20 public school buildings, including the high-school building erected in 1890, in which, in addition to the usual studies, instruction in manual training is given. It has also six Roman Catholic parish schools, and is the seat of Harry Hillman Academy (for boys), the Wilkes-Barré Institute (for girls), the Wilkes-Barré Business College, the New Century School of Correspondence and two Roman Catholic academies for girls — Saint Mary's, connected with Saint Mary's Convent, and Saint Ann's, connected with Malinckrodt Convent. There are two large public libraries — The Osterhout Free Library (having reference and circulating departments), and the reference library of the Wyoming Historical and Geological Society. In addition, the Law and Library Association, the Young Men's Christian Association and other organizations have library collections. The government of the city is vested in a mayor, a select council and a common council; the appointing power rests largely with the mayor. Pop. (1890) 37,718; (1900) 51,721; (1904, estimated) 57,000. But, allowing the city on all its boundaries are boroughs and hamlets, so that, within a radius of nine miles from the center of Wilkes-Barré, there is a population of 185,000.

OSCAR J. HARVEY.

Wilkie, wíl'kí, SIR DAVID, Scottish painter: b. Cults, Fifeshire, 18 Nov. 1785; d. at sea, off Gibraltar, 1 June 1841. In 1799 he entered the Trustees' Academy, Edinburgh, where he studied for several years. In 1804 he returned home and painted 'Pitlessie Fair,' the first of that class of works for which he became famous.

In 1805 he went to London, taking with him the 'Village Recruit,' which at length found a purchaser for £6. The Earl of Mansfield purchased his 'Village Politicians,' which at the Royal Academy (1806) excited universal admiration. It was succeeded by the 'Blind Fiddler,' and among the works painted between this period and 1821 may be mentioned the 'Rent Day' (1807); 'Blindman's Buff' (1813); 'Distraint for Rent' (1814); 'The Penny Wedding' (1818); the 'Reading of the Will' (1820); and the 'Chelsea Pensioners,' begun in 1817 and finished in 1821, for the Duke of Wellington. Among the most noted of his later pictures are the 'Entrance of George IV. into Holyrood'; the 'Spanish Council of War'; and the 'Maid of Saragossa.' In 1836 William IV. created him a knight. In 1840 he made a journey to the East, and on the way home was attacked by fever at Malta, and died at sea.

Wilkins, wíl'kíuz, **Mary Eleanor**. See FREEMAN, MARY ELEANOR WILKINS.

Wilkinsburg, wíl'kínz-berg, Pa., borough, Allegheny County, on the Pennsylvania Railroad; five miles east of Pittsburg. It was formerly called McNairville, and Rippeyville, and was given its present name in honor of William Wilkins, secretary of war in 1843-5; it was incorporated as a borough in 1887. Its business interests are identified with those of Pittsburg, and it is almost entirely a residential town; it contains a national bank with a capital of \$50,000. It is the seat of a home for aged women (Protestant) and of the United Presbyterian Home for the Aged; and there is a high school, established in 1898. Pop. (1890) 4,662; (1900) 11,886.

Wilkinson, wíl'kín-son, **Henry Spenser**, English author: b. Manchester, England, 1 May 1853. He was educated at Owens College, Manchester, and at Merton College, Oxford, and in 1880 was called to the bar. He was on the staff of the Manchester *Guardian*, 1883-02, and since 1895 has been on the staff of the London *Morning Post*. His writings include: 'Essays Toward the Improvement of the Volunteer Forces' (1886); 'The Brain of an Army' (1890); 'The Great Alternative, a Plea for a National Policy' (1894); 'The Nation's Awakening' (1896); 'British Policy in South Africa' (1899); 'War and Policy' (1900); 'The Nation's Need, Chapters on Education' (edited, 1903); etc.

Wilkinson, **James**, American soldier: b. Benedict, Md., 1757; d. near City of Mexico 28 Dec. 1825. He studied medicine in Philadelphia, and in 1775 enlisted in Washington's army. He became intimate with Benedict Arnold and Aaron Burr, and, having received a captain's commission, joined Arnold's expedition to Canada. He was later appointed to the staff of Gen. Gates, was promoted colonel, and subsequently became deputy adjutant-general of the Army of the Northern Department. In the Saratoga campaign he appropriated as his own the information of the British position and strength which had been secured by Col. John Hardin, and after the surrender of Burgoyne was commissioned to bear the news to Congress, carrying with him also the recommendation of Gates that he be appointed brigadier-general. He was 18 days in making the journey, and the news was a week old when he delivered his

WILKINSON

message. Congress refused to grant his promotion at that time, but a few weeks later, through the influence of Gates, he was brevetted brigadier-general and subsequently was appointed secretary of the Board of War, of which Gates was also a member. He was deeply implicated in the Conway Cabal (q.v.), which his indiscretion betrayed, and was then forced to resign his brevet rank, though retaining his colonelcy. He took no further active share in the war until 1779, when he was appointed clothier-general, an office which he resigned in 1781. He removed to Kentucky in 1784, and in 1786 founded Frankfort. He gained considerable political influence there, intrigued with the Spanish government, with the hope of forming of the Western country a separate republic under the protection of Spain. His reward for this betrayal of his country was to be the exclusive control of commerce on the Mississippi and a yearly pension from the Spanish government. The plot was to be consummated at the convention which met in 1788 for the purpose of forming a constitution for the new State of Kentucky. Wilkinson's influence, however, proved insufficient, and the plot, becoming known to other leaders, fell through. The part of Wilkinson remained a secret, and though he continued to receive his pension from the Spanish government until 1800, he applied in 1791 for service in the army. His treasonable act not being known, he was appointed lieutenant-colonel, served in the Indian wars of the West, and was prominent in Anthony Wayne's campaign. He was promoted brigadier-general in 1792, and in 1796 succeeded Wayne in the command of the army. After the acquisition of Louisiana he was appointed in 1805 governor of the Territory of Louisiana and in this position engaged with Aaron Burr (q.v.) in the latter's scheme for founding an empire in Mexico. In 1806 Wilkinson, perceiving an opportunity to drive a double bargain, betrayed the scheme to the President, and at the same time demanded from the viceroy of Mexico a reward for saving that kingdom to Spain. The assertions of Burr as to Wilkinson's complicity in the plot were generally believed, but at that time no proof of his guilt was obtainable, though he barely escaped indictment on the same charge with Burr in 1807. Inquiry concerning his pension from the Spanish government was made in that year upon a resolution of John Randolph, but he was exonerated. Charges were again made against him in 1810 on the score of complicity with Burr and of receiving pay from the Spanish government, but he was finally acquitted in December 1811, and resumed command in the army. He was promoted major-general during the War of 1812, and commanded the Canada Expedition, but proved incompetent and in 1814 was superseded. He was court-martialed in that year on several serious charges—neglect of duty, conduct unbecoming an officer, drunkenness, etc.—but in 1815 was acquitted and honorably discharged from the army. He then removed to the City of Mexico, where he spent the remainder of his life. He published: 'The Aaron Burr Conspiracy Exposed' (1808); and 'Memoirs of My Own Times' (1816). Consult: Clark, 'Proofs of the Corruption of Gen. James Wilkinson' (1809); Gayarré, 'Spanish Dominion in Louisiana' (1854); Gilmore, 'Advance-Guard of

Western Civilization' (1887); Roosevelt, 'Winning of the West,' Vol. III. (1894); Green, 'The Spanish Conspiracy' (1891); McCaleb, 'The Aaron Burr Conspiracy' (1903).

Wilkinson, Jemima, American religious visionary: b. Cumberland, R. I., 1753; d. Jerusalem, Yates County, N. Y., 1 July 1819. She was educated as a Quaker and at 20, after a severe attack of fever, she professed that she had been raised from the dead, that her carnal life was ended, and that henceforth her body was reanimated by the spirit and power of Christ. She pretended to work miracles, and, though entirely illiterate, induced many intelligent people to become her followers, her attractive person and extraordinary tact and shrewdness aiding her in maintaining the imposture. In 1786, at a meeting of her disciples, it was resolved to found a colony in Yates County, N. Y., in the present town of Torrey. The next year 25 of her followers went to the new purchase, and prepared the land for wheat. In 1789 two of the number purchased 14,000 acres of land in that vicinity, to which was afterward added the township of Jerusalem. The same year Jemima and a large number of her followers came, and a house was erected for her. She had taken the name of the "universal friend," and assumed a costume which belonged about equally to either sex, as she asserted that in her spiritual body there was no sex. She was accompanied by two "witnesses," Sarah Richards and Rachael Miller. She exacted from her followers the most complete submission and the most menial services, her influence over them being practically supreme. A farm of 1,000 acres was set apart for her special use, and cultivated freely by her followers. She insisted on the Shaker doctrine of celibacy, and the exercises at her religious meetings resembled those of that sect. She never relinquished her pretensions, but after some years her influence waned, and the latter part of her life was embittered by jealousies and annoyances which she bore with no great fortitude. After her death the sect was entirely broken up. Consult: Hudson, 'Jemima Wilkinson, a Preacheress of the 18th Century' (1821); 'Memoir of Jemima Wilkinson' (Bath, N. Y., 1844).

Wilkinson, Sir John Gardner, English archæologist: b. Haxendale, Westmoreland, 5 Oct. 1797; d. Llandoverly, Caermarthenshire, 29 Oct. 1875. He was educated at Harrow and Oxford, and after leaving Oxford lived in Egypt 1821-33, during his stay making a thorough study of the ancient monuments of that country as well as of the languages and manners of the modern inhabitants. The most important fruit of his labors was a work entitled 'Manners and Customs of the Ancient Egyptians Derived from a Comparison of the Painting, Sculpture, and Monuments Still Existing, with the Accounts of Ancient Authors' (1837-41), which still remains a standard authority on all that relates to Egyptian art. His later works about Egypt are of a more popular character. Among them are 'Modern Egypt and Thebes' (1833), afterward abridged and published as a 'Handbook for Travelers in Modern Egypt' (1847); 'A Popular Account of the Ancient Egyptians' (1853); and 'The Egyptians under the Pharaohs' (1851), forming a supplement to the previous work. His principal other

WILKINSON — WILL

works are 'Dalmatia and Montenegro' (1848); and 'Color, and the Necessity of a General Diffusion of Taste Among All Classes' (1858). He was knighted in 1839. The collections made by him were given in part to the British Museum, but a considerable proportion of them was presented to Harrow.

Wilkinson, William Cleaver, American educator: b. Westford, Vt., 19 Oct. 1833. He was graduated from the University of Rochester in 1857, was ordained in the Baptist ministry in 1859, and in 1859-61 was pastor of the Second Baptist Church, New Haven, Conn. He was professor *ad interim* of modern languages at the University of Rochester in 1863-4, and was engaged in pastoral work at Cincinnati, 1863-6. He was professor of homiletics and pastoral theology at the Rochester Theological Seminary in 1872-81, was engaged in literary work in 1873-92, and has since been professor of poetry and criticism at the University of Chicago. He is counsellor of the Chautauqua Literary and Scientific Circle and has published: 'The Dance of Modern Society' (1868); 'A Free Lance in the Field of Life and Letters' (1874); 'The Baptist Principle' (1881); 'Poems' (1883); 'Edwin Arnold as Poetizer and Paganizer' (1885); 'Classic German Course in English' (1887); 'The Epic of Saul' (1891); 'The Epic of Paul' (1898); 'The Epic of Moses' (1903); etc.

Wilkinsonians. See RELIGIOUS SECTS.

Will. It has been usual to classify mental phenomena under the three headings of cognition, feeling, and will or conation. In the last class are included all those processes in which the mind is regarded as effecting some change in its own states, or in the physical environment by means of bodily movements. These changes may take place in a more or less clearly conscious way: that is, in producing changes by means of inner or outer acts of will, we may be more or less explicitly aware of the nature of the result to be attained, and of other possible lines of action. It is an essential characteristic of the states that we name impulses or instincts that they are not deliberative. These processes, however, as expressions of the appetitive or active powers of the mind, are conative in character. Automatic or reflex acts, on the other hand, being brought about without any mediation of consciousness, cannot be regarded as belonging to will at all. In impulse the act is initiated by a feeling of uneasiness or craving which has a tendency to discharge immediately in some movement to relieve this feeling. It is from such immediate and impulsive reactions of consciousness that those more explicit and conscious processes that we call voluntary acts develop. We are not born with the power of performing voluntary acts, but this is a progressive acquirement that presupposes an experience of the results of involuntary acts, and the means of obtaining or avoiding these results. The development of will, in the true sense in which it is an endowment that belongs only to rational beings, as it passes from the stage of impulse and instinct, involves a growing consciousness of the relative value of various ends, and also of the means that may be used for the realization of these ends. The development of will is thus only possible through the development of the mind as a whole. Moreover,

it is to be noted that this development implies further the systematic integration and union of the rational and emotional sides of mind with its active or conative aspect. As mind develops, all of its functions become more closely and organically connected.

What has just been said may serve to show the fallacy in the view of the older psychology which regarded will as a distinct faculty, opposed, as if it were a separate department, to feeling and cognition. It was too often forgotten in making this division that these faculties were not each *sui generis*, and that the so-called "faculty" is only an abstraction if thought of as a kind of entity apart from the concrete processes of consciousness. Moreover, the emotional and cognitive states of mind do not exist in separation from the conative aspect, but the latter is necessarily implicated and involved in them. It has been one of the most important achievements of recent psychological analysis to exhibit the presence of will in various intellectual processes, like perception, association, and thinking, in the form of the selective activity of attention. The true view then is that cognition, feeling, and conation are "moments" or "aspects" of mind that can be distinguished by analysis, but which exist and function concretely only in relation to each other. At the present time, psychologists are not agreed as to whether it is possible to discover by analysis any definite conative process as a structural element in conscious life, corresponding to the elementary sensations or feelings. The reality and functional efficiency of the will is not really at stake in this question, however, as has been too hastily assumed by certain representatives of both parties to the dispute. Even if it is found that the processes of will cannot be isolated as separate and distinct states of mind, there will be no ground for denying the real activity of the subject. The truth seems to the present writer to be that will cannot properly be represented in the form of one particular kind of mental content, just because it is the expression of the attitude of the self toward all mental content.

We have seen that those processes of fully explicit will that we term voluntary acts are always accompanied by a somewhat clear consciousness of the end to be realized, and of the relation of means to this end. Moreover, in a fully deliberative act of will, there is also a recognition of various competing possibilities and a conscious selection of one to the exclusion of the others. Instead of allowing an impulse to pass at once into action in accordance with the immediate demands of some single want or uneasiness, in voluntary states consciousness takes control, looking before and after and comparing the consequences of different lines of action. In many cases its efficiency and control are shown by checking or inhibiting the immediate impulse by the thought of some more valuable end with which it conflicts.

How are such volitions to be described psychologically? What actually goes on when a decision is voluntarily made? If we leave out of account the various sensations of muscular strain that accompany volitions, we may say that the essence of the act consists in fixing one alternative and holding it fast before us by means of selective attention. This attention is not passively determined by the greater intensity or immediate attractiveness of one object, but is

the result of the fullest activity of the subject, and is at once a psychological fact and a moving force in the external world. As Prof. James remarks: "We do not first have a sensation or thought, and then have to add something to it to get a movement. Movement is the natural immediate effect of feeling, irrespective of what the quality of the feeling may be. It is so in reflex action, it is so in emotional expression, it is so in voluntary life."

The Freedom of the Will.—The vexed problem of the freedom of the will arises from the fact that there seems to be an antagonism between the demands of our intellect and those of our moral nature. On the one hand, there is the requirement that all phenomena of the inner life, like those of external nature, shall be capable of explanation according to the law of cause and effect. On the other hand, it is maintained that if morality is to have any meaning, the individual must be free and thus responsible for his acts. In favor of determinism, it is argued that the mental life is composed of a series of states or processes that are related to each other causally just as are events in the external world; this is the necessary assumption of psychology and of all the sciences that attempt to explain the mental life. "Whenever determination by necessary laws ceases, there ceases also the possibility of any explanation." Moreover, determinists point out that the individual is moved to act by certain motives, and that these motives are the resultant of certain external influences as modified by his character. This character again is the product of previous acts, either of his own or of his ancestors; so that at any time the act performed is the necessary reaction of the individual in the given circumstances. Furthermore, it is maintained that there is an unbroken line between acts that are performed from instinct or impulse, and where consequently there can be no claim made for freedom, and the most complicated and deliberate acts of will. On the other side, those who contend for freedom argue that we have no right to consider the mind of man as simply a part of nature and subject like it to necessary laws of causation. They urge in support of their position that personality, the principle of intelligence itself, cannot properly be represented as one factor on a level with others, but that it is the centre from which the very conception of law springs, and on another side is the determining ground of all motives, and furnishes the standard by which they are evaluated. Appeal is also made to the immediate conviction of freedom that is present in all genuine cases of willing. Further, it is said that it is only on the assumption of freedom that such terms as "responsibility," "duty," "obligation," and "remorse" have any meaning. He who denies freedom, then, declares the experiences denoted by these words to be illusory.

It is impossible to give in the present article a detailed examination of these arguments. A few remarks may, however, be added regarding the general nature of the problem and the lines along which a reconciliation may be effected. In the first place, it is obvious that this controversy is a special phase of the general problem of mechanism (q.v.) and teleology (q.v.). Is everything to be explained according to necessary laws of cause and effect, or is it possible without doing violence to this principle to main-

tain a determination according to ends? If it is possible for the individual to set before himself the ends of his life, and to work for their realization, he is free in the only sense in which the word has any meaning. If, however, his acts are determined by some force that acts independently of him, he cannot be held responsible. Again, determinism is the only standpoint from which psychology as a natural science can proceed. For this science views the mental life as made up of a series of processes or mental phenomena. Its task, therefore, is to discover how these various elements are linked together according to causal laws. From the very nature of its postulates it is impossible to admit that there is any break in the line of causes and effects; every "state of mind" must be explained by showing that it stands in necessary relations to some other phenomena belonging to the same series. But this is to look at the mind from the outside, as composed of a number of phenomena, or mere occurrences in time. It is, however, possible to describe mind in a way that is truer to the direct experience of life, as a system of conscious functions or acts in which purposes are being realized and ends attained through the self-directed activity of the subject. As soon as this point of view is taken the causal and deterministic position is left behind, and the only possible assumption is that of self-determination or freedom. The conclusion we have reached then is that, so long as we regard mind from the standpoint of psychology as a science, everything must be explained causally, and that there is no possibility of introducing here the conception of freedom. But we have also seen that this standpoint is not final, but that experience can be more adequately interpreted as a process in which a conscious subject realizes ends that he himself sets, and that this view necessarily regards mind as something more than a series of causally determined phenomena.

J. E. CREIGHTON,

Professor of Philosophy, Cornell University.

Will, in law, is a disposition made by a competent person known as the testator in a form prescribed by law, of property over which he has legal power of disposition, to take effect at death. Technically, the term "Will" is used to describe an instrument which disposes of real property, while "Testament" is used to describe one that disposes of personal property, "Will and Testament" including both. Broadly, and by common use, the term "Will" covers both meanings and is accepted as describing an instrument that disposes of both realty and personalty. Any person of legal age, being of sound mind and memory and not under duress, may make a will disposing of whatever interest he has at his death in either real or personal property. All wills to be valid, with the exception of a favored class known as "Nuncupative

WILL-O'-THE-WISP — WILLARD

Wills" which are oral, must be written and signed by the testator and witnessed by at least two persons who must sign in the presence of the testator and of each other, and are not beneficiaries under the will. Oral wills are permitted in the case of soldiers and sailors in actual service, and these "nuncupative" wills are definite statements of the will of the maker with two or more witnesses, who shall within a reasonable time thereafter reduce the statement to writing and sign as witnesses. A beneficiary cannot be a competent witness to a nuncupative will. A will may be altered or amended by the addition of the further wish of the testator, the amendment being known as a "Codicil," which must be signed by the testator and witnessed with the same formality as the original will. A will may be revoked by the testator by destroying it, such as by canceling, tearing, burning, or otherwise mutilating it, or by making a new will, which later will invalidates all preceding wills. The destruction of a later will revives a former will, which will then have full effect. In some States the subsequent marriage of the testator invalidates a will. The laws of the different States vary as to the provisions for the heirs and next of kin.

A will may be written in any language that expresses the intention of the testator. It need not be written in any prescribed form, but must show the intention. It may be written in any form of writing material or on several pieces of paper if their sense shows them to be connected each to the other. Separate documents may be included in the will if the will speaks of their incorporation in the will as a part of it, and in such a way as to identify the documents. Publication is the act of making known in the presence of witnesses that the instrument executed is the will of the testator. It is not necessary for the witnesses to know the contents of the will, but the fact that it is the will. Publication is not necessary in all States. A will usually names one or more persons who shall carry out the will of the testator. This person is known as the executor. When no person is named in the will the court appoints such person, who is known as the administrator. At the death of the testator the will is placed on file for probate in the probate or surrogate court. A will is construed liberally, the words taken in their plain and usual sense, and the intention of the testator allowed to prevail wherever possible to understand such intention. Effect is given to every part of a will. Rules of construction are valuable only in case the will is contested. Favor is shown in case of contest to natural heirs and next of kin. Conditions may be made, and trust estates created, and whatever interest the testator may have at death may be disposed of by will during his lifetime to take effect at death. When a testator has a large estate it is customary to have his will drawn up by an attorney who is familiar with rules of construction and of evidence. This is not necessary to the validity of a will, which may be written by any one so long as it is properly signed and witnessed.

Will-o'-the-wisp. See IGNIS FATUUS.

Willamette, wil-ä'mët, a river in Oregon which has its rise in Lane County, flows nearly north and enters the Columbia River in Columbia County, in the northwestern part of the

State. The total length is about 200 miles. It is navigable for large steamers to Portland (q.v.), 15 miles from its mouth.

Willard, wil'ard, Ashton Rollins, American art critic: b. Montpelier, Vt., 14 April 1858. He was graduated from Dartmouth in 1879, removed to Boston in 1887, and has since spent much time in Europe. In 1902 was made chevalier of the Order of the Crown of Italy. His writings include: 'Life and Work of Painter Domenico Morelli' (1895); 'History of Modern Italian Art' (1898); 'Land of the Latins' (1902); etc.

Willard, Edward S., English actor: b. Brighton, Sussex, 1853. His first appearance on the stage was made at Weymouth in 1869, but his London début was not made until 1881. He became manager of the Shaftesbury Theatre in 1889 and in 1890 came to the United States, where he played successfully for three years. He leased the Comedy and Garrick Theatres in London in 1894 and has since made several tours of the United States, playing various leading parts under his own management.

Willard, Emma Hart, American educator: b. Berlin, Conn., 23 Feb. 1787; d. Troy, N. Y., 15 April 1870. She began her career as a teacher in 1803, subsequently became principal of a girls' academy at Middlebury, Vt., and in 1809 was married to Dr. John Willard. She opened at her home in Middlebury, Vt., in 1814, a boarding school for girls in which she introduced various improvements in methods of instruction and also taught subjects hitherto not included in the curriculum of girls' schools. Desiring a broader field for the development of her ideas of education she addressed to the New York Legislature in 1810 a treatise entitled 'A Plan for Improving Female Education.' It was an able exposition of excellent ideas and found favor with Gov. John Clinton, resulting in the establishment in that year of a seminary for girls at Waterford, N. Y., which was incorporated and was partially supported by the State. She removed to Troy in 1823 where she was presented by the city with a suitable building for her school, henceforth known as the Troy Female Seminary. After the death of her husband in 1825 she conducted the business management of the school in addition to her other work until 1838, when she resigned her duties into the hands of her son. She traveled in Europe in 1830, assisted in founding a school for girls in Athens, Greece, and afterward published 'Journal and Letters from France and Great Britain' (1833), the proceeds of which she presented to the school. She was married to Dr. Christopher C. Yates in 1838, but in 1843 she secured a divorce from him and resumed her former name. She traveled 8,000 miles through the Southern States in 1846 engaged in lecturing before conventions of teachers, and in 1854 was present at the World's Educational Convention in London. Mrs. Willard is one of the most prominent figures in the history of higher education for women in the United States. She was not only an advocate of advancement but a practical worker for it, and brought to her task great earnestness of purpose, coupled with high abilities and executive capacity. Her school-books were widely used and were translated into European and Asiatic languages. They include: 'The Wood-

WILLARD — WILLARD SCHOOL

bridge and Willard Geographies and Atlases' (1823); 'History of the United States' (1828); 'Treatise on the Circulation of the Blood' (1846); 'Last Leaves of American History' (1849); 'Astronomy' (1853); 'Morals for the Young' (1857); etc. She also wrote some excellent verse, which includes the famous 'Rocked in the Cradle of the Deep.' A statue was unveiled to her memory at Troy in 1895. Consult John Lord, 'Life of Emma Willard' (1874).

Willard, Frances Elizabeth, American educator and temperance reformer; b. Churchville, N. Y., 28 Sept. 1839; d. New York 18 Feb. 1898. She was graduated from the Northwestern Female College, Evanston, Ill., in 1859, engaged in teaching, was appointed professor of esthetics in the Northwestern University in 1869, and became dean of the Women's College of that institution in 1871. In 1874 she resigned this position, was elected secretary of the Woman's Christian Temperance Union in that year, and in 1879 she became its president, an office she held until her death. In her management of the association she displayed great executive ability and a remarkable genius for organization. She founded in 1883 the World's Christian Temperance Union, and in 1888 became its president. She declared herself in favor of woman's suffrage in 1876 and thereafter lectured occasionally upon the subject, deeming the ballot a protection to women from the miseries caused by drink. In 1892 she visited England, where she was the guest of Lady Henry Somerset, the temperance reformer, and while there addressed a mass meeting at Exeter Hall, said to have been one of the largest assemblages ever held there. In her work Miss Willard displayed an untiring energy, and for 10 years she averaged a meeting a day, meanwhile continuing her literary labors. She was editor of the *Chicago Post and Mail* for a short time after 1878, and from 1892-8 editor-in-chief of the 'Union Signal,' the official organ of the temperance movement. Her publications include: 'Nineteen Beautiful Years' (1868); 'Woman and Temperance' (1883); 'Glimpses of Fifty Years' (1889); 'A Great Mother' (1894); etc. She also edited with Mary A. Livermore, 'A Woman of the Century' (1893).

Willard, Josiah Flynt, American author and sociologist; b. Appleton, Wis., 23 Jan. 1809. While studying at the University of Berlin in 1890-5 he became deeply interested in sociological problems, and was particularly impressed with the danger impending to the United States through its being looked upon by the criminal class of Europe as a haven of refuge when their own country would no longer suffer their being at liberty. In order thoroughly to understand the situation and the actual conditions and feelings governing the tramp world he led for several years the life of a vagrant, publishing the results of his observations in 'Tramping with Tramps' (1899). His other writings include: 'Powers that Prey' with F. Walton (1900); 'Notes of an Itinerant Policeman' (1900); 'The World of Graft' (1901); 'The Little Brother' (1902); 'The Rise of Ruderick Clowd' (1903); etc.

Willard, Samuel, American clergyman, scholar, and educator; b. Concord, Mass., 31 Jan. 1640; d. Boston, Mass., 12 Sept. 1707. Graduated from Harvard in 1659, he studied

theology, and in 1663 was ordained minister at Groton, Mass. This village having been destroyed by the Indians (1676) during King Philip's war, he removed to Boston, where he was made colleague of Thomas Thacher, pastor of Old South, and upon the latter's death (15 Oct. 1678) succeeded to the pastorate, which he held until his death. In 1700 he became vice-president of Harvard, and in 1701, upon the resignation of President Increase Mather (q.v.) (6 Sept.), assumed the direction of the institution. He retained the active pastorate of the South Church, however, and by order of the General Court was debarred from the title of president. He was opposed to the persecutions for witchcraft, and wrote and spoke against the delusion. In 1688 he began to give a series of Tuesday afternoon lectures on theology, and these he continued for the rest of his life. The lectures were printed in 1726 in a folio of 914 double-columned pages. "The thought and expression of this literary mammoth," says Tyler, "are lucid, firm, and close." Willard published numerous sermons and other writings.

Willard School, The Emma. The Emma Willard School, which in 1904 entered on its 91st year, is one of the oldest institutions for the higher education of women in the United States. It is the outgrowth of an institution founded by Mrs. Emma Willard in Middlebury, Vt., in 1814.

In 1819, the patrons of Waterford, N. Y., urged removal of the school to that place, believing the richer State of New York would grant it an appropriation. The legislature did not grant an endowment, but the application led to the allowing of a portion of the literature fund for girls' schools, to be given to the school, the first legislative appropriation of money for the education of girls.

In 1821, Mrs. Willard accepted an invitation from the citizens of Troy to remove the seminary to that city, where the school became known as the Troy Female Seminary. From the establishment of the seminary in Troy in 1821, to 1875, more than 15,000 pupils were connected with the school. In 1892, a complete reorganization of the course of study was made, the art department was introduced, the boarding department was opened in Russell Sage Hall, and the old name gave way to that of Emma Willard School, thus bringing the school into close touch with its famous past and associating it in name with its illustrious founder.

The school is situated in Troy, N. Y., on the Hudson River, a city of about 80,000 inhabitants. Troy has a healthful climate, being surrounded with attractive open country which can be reached easily. It is within a few hours' journey of many noted health resorts, and places of natural and historic interest; among which are the Green Mountains, the Catskills, the Berkshires, Lake George, Bennington, and Saratoga. Excursions to some of these places can be taken in the spring and autumn if desired. Troy is an important railway centre, and is easily accessible from many directions, by various lines of railroad. Advantages of New York are available during vacations, for students, if desired by parents or guardians.

The school now occupies, in addition to the former residence of Mrs. Emma Willard, three new beautiful buildings erected for its use.

Russell Sage Hall, the gift of the Hon. Rus-

sell Sage, whose wife is the efficient president of the Emma Willard Association, is the residence for members of the faculty and for boarding pupils. The building consists of five stories above the basement. It is fire-proof in construction, all floors having steel beams with a filling of fire-proof material, and all dividing walls and partitions being of brick or hollow tiles.

The Gurley Memorial Hall contains the assembly room, recitation rooms, gymnasium, laboratories, library, and offices. It is a two-story basement structure, having a central section and two wings, built of granite with Long Meadow brown-stone trimmings, and has a handsome appearance from every point of view. This building is also fire-proof, all of the floors are laid upon brick, supported by iron beams, and the plastering and ceiling are applied directly to the brick without lath. The rooms are spacious, with high ceilings, are well lighted and are handsomely furnished.

The library contains over 2,000 volumes, and is open daily for the use of faculty and students. The Troy Public Library, with more than 40,000 volumes, is situated directly opposite the school.

The Anna M. Plum Memorial building, the gift of Mrs. G. V. S. Quackenbush, in memory of her daughter, Miss Anna M. Plum, a graduate of the school, contains the studios and offices for the departments of music and art. It has three stories, and is built of granite with brown-stone trimmings.

The government of the school, and its underlying idea, is mutual good, understanding and sympathy between teacher and pupil. There are few regulations to be enforced, for it is taken for granted that girls entering the school are ladies and mean to do right. The design is to combine thorough scholarship with culture, and the oversight and care exerted are given as a help and guidance in developing self-respect and self-control.

The school is undenominational, but positively Christian in its influence. Regular attendance at church is expected, and students are permitted, under charge of some teacher, to attend any church preferred by their parents.

W. F. GURLEY,

President Board of Trustees.

Willcox, wīl'kōks, **Orlando Bolivar**, American soldier: b. Detroit, Mich., 16 April 1823. He was graduated from West Point in 1847, saw service in the Mexican war under General Scott and subsequently in the Seminole wars and other Indian campaigns. He was promoted lieutenant in 1850 and in 1857 resigned from the army, thereafter engaging in law practice at Detroit until the outbreak of the Civil War, when he re-entered the army as colonel of volunteers. He was engaged at the capture of Alexandria, and at the first battle of Bull Run was wounded and taken prisoner. He was exchanged in 1862 and afterward participated in the battles at South Mountain, Antietam, and Fredericksburg, led a division at the battle of the Wilderness and in the Richmond campaign, and in 1864 was brevetted major-general of volunteers. He was the first to enter Petersburg, receiving its surrender, and in 1866 was mustered out of service. He re-entered the regular army with rank as colonel in 1866, was bre-

vettet brigadier-general and major-general in the regular army in 1867 for services at Petersburg and Spottsylvania, and was voted a Congressional medal of honor for gallantry at Bull Run in 1861. He received full rank as brigadier-general in 1886 and in the following year was retired. He wrote: 'Shoepack Recollections by Walter March' (1856); and 'Faca: An Army Memoir, by Major March' (1857).

Willemite, an important ore of zinc and a mineral of much mineralogical interest. It is essentially a zinc orthosilicate, Zn_2SiO_4 , but all of the many varieties from Franklin Furnace and Ogdensburg, N. J., its two most prolific localities, contain considerable manganese. The colors of the New Jersey willemite are very varied, white, green, yellow, flesh-red, brown and gray, the last three being characteristic of the variety troostite which occurs in crystals up to six inches in length. The crystallization of willemite is rhombohedral, the common form being a hexagonal prism, either stout or much elongated, terminated by obtuse rhombohedrons. It occurs in small crystals of prismatic or obtuse rhombohedral habit in New Mexico. A granular form is also found in New Jersey in large quantities, intimately mixed with franklinite. Crystals from Belgium have an easy basal cleavage, but this cleavage is difficult in New Jersey crystals, which have eminent prismatic cleavage. The mineral has a hardness of 5.5 and a specific gravity of 3.9 to 4.2. Transparent crystals and masses have been found in New Jersey which yield gems whose beauty is much enhanced by the strong double refraction of the mineral, though the inferior hardness precludes their use as jewels. Ordinarily willemite is opaque, but with transparent portions scattered through the mass. The green phosphorescence of willemite when struck with a hammer has been known for many years. During exposure to the Röntgen rays and to the ultra-violet and other rays of the Piffard lamp a gorgeous green fluorescence is observed in the New Jersey mineral and some specimens are also highly phosphorescent, but these properties are not possessed by willemite from other localities. Radium salts excite instant luminescence in the New Jersey mineral. These observations have attracted widespread interest in the mineral.

Willems, wīl'lēms, **Florent**, Belgian artist: b. Liège, Belgium, 9 Jan. 1823. He studied at the Academy of Mechlin and formed his style upon that of the old Dutch masters. He removed to Paris in 1844 and was awarded first-class medals in 1855, 1867, and 1878. His work has been well received in the United States and examples of it are included in many private collections. Especially good canvases by him may be seen at the Metropolitan Museum of Art in New York, and at the Art Institute of Chicago.

Willems, Jan Frans, Flemish philologist: b. Bouchout, near Antwerp, Belgium, 11 March 1793; d. Ghent 14 June 1846. In 1809 he was placed in the office of an Antwerp notary, and in 1811 won a prize for the best poem on the battle of Friedland and peace of Tilsit (1811). His ode, 'Aen de Belgen' ('To the Belgians,' 1818), hailing the revival of Belgian nationality under Holland's protection, brought him a position under the Dutch government and a series of masterly philological works, including

WILLET — WILLIAM

'Over de Nederduitsche Taal en Letterkunde' (1819-20), procured him admission to the Academy of Antwerp. On the formal separation of Belgium from Holland in 1830 he was removed from office and settling at Enclooe, he labored there on the Flemish version of "Reynard the Fox," in his edition of it (1834) calling on Flemings to help to preserve their ancient tongue. As archivist of Ghent from 1835 he edited the 'Rymkronyk van Fan van Helu' (1836), 'Brabantsche Yeesten' (1839-43), etc., and after his death appeared his collection of old Flemish songs, and his 'Mengelingen van Vaderlandschen Inhoud.' Consult lives by Snellaert (1847); Rooses (1874); and Rooses, Buylstede, and Bergmann, 'Jan Frans Willems' (1893).

Willet, an American snipe of the genus *Symphemia*. The bill is thick, compressed, straight, longer than the head; wings long, legs long and strong; tail short and nearly even. The *S. sempalmata* is about 15 inches long and 31 in alar extent, the bill $2\frac{1}{2}$; it is darkly speckled above; rump, upper tail coverts, and under parts white; tail ashy white, the two middle feathers spotted; secondaries white, with brownish black spots. The young are spotted and transversely banded with brownish black. It is found throughout eastern temperate North America, and in South America, rarely going far from shore; on the Pacific it is represented by a distinct subspecies. It goes south in winter as far as the Gulf States where it also breeds sparingly; and is often found in company with the godwits. It breeds in both fresh and salt marshes on the ground and remain in separate flocks during the fall and winter. The eggs and the flesh, especially of the young birds, are excellent eating. The food consists of small crustaceans, and aquatic worms and insects. They are rather shy, rapid and strong fliers, and good swimmers if necessary, though they cannot dive. They are noisy while breeding, the shrill cry being reiterated as long as an intruder remains in sight. The name is derived from the resemblance of their notes to the "will-willet." Owing to their shyness, the keen sight which enables them to detect the sham of decoys, and their swift, often elevated flight they are difficult to shoot, and offer fine sport to the skillful sportsman. For these reasons, and because of their large size and excellent table qualities, they are much sought. Consult Eliot, 'North American Shorebirds' (New York 1895).

Willett, Marinus, American soldier: b. Jamaica, N. Y., 31 July 1740; d. New York 22 Aug. 1830. He served in the French war with rank as lieutenant, was especially prominent in the expedition against Ticonderoga in 1758, and in the capture of Fort Frontenac. He was active in the movements of the Sons of Liberty and on 6 June 1775 took measures to prevent the forwarding of arms from New York to the British troops in Boston Harbor. He served as captain under Montgomery in his expedition against Canada in 1775, remaining in command of the post at Saint John's until January 1776; was second in command at Fort Stanwix in 1777, led and held the fort until relieved by Arnold. In June 1794 accepted a mission to the Creek Indians present at Monmouth, and in 1799 joined the expedition of General Sullivan against the Six

Nations. He commanded the forces in the Mohawk Valley from 1780 until the close of the war, conducting in 1783 the attempted surprise of the garrison at Oswego, which was the last hostile movement against the British. In 1784-92 he was sheriff of New York, and in 1794 accepted a mission to the Creek Indians and succeeded in concluding with them a treaty of peace. He was appointed mayor of New York to succeed De Witt Clinton in 1807, and in 1812 was secretary of a mass meeting which favored military preparations against the British. He left several manuscript journals from which his son, W. M. Willett, prepared 'A Narrative of the Military Actions of Col. Marinus Willett' (1831).

Willets Point, N. Y., national military reservation on the south shore of East River at its entrance to Long Island Sound. The reservation comprises 136 acres, purchased partially in 1857 and partially in 1863; the construction of a fort was begun here in 1862, but the work was suspended and the fort remains unfinished. After the war, an engineer battalion was ordered here to establish a depot for stores, a station for torpedo experiments, and a school of practice. The post which constitutes one of the defenses of New York harbor is also known as Fort Totten (q.v.).

William I., surnamed the CONQUEROR, king of England and duke of Normandy: b. Falaise, Normandy, 1027 or 1028; d. Rouen 9 Sept. 1087. He was the natural son of Robert, duke of Normandy, by Arletta, the daughter of a tanner of Falaise, and his father, having no legitimate son, when about to set out on a pilgrimage to Jerusalem, nominated him as his heir. Robert died in 1035, while returning from Palestine; and Normandy fell for time into a condition of anarchy. When William succeeded to the dukedom his vigor and ability soon restored order, and his power increased so much as to excite the jealousy not only of the surrounding nobles, but of his suzerain the king of France. Two combinations were formed against him, and twice his territory was invaded; but he repelled these aggressions, and reduced the French king to the necessity of peace. The opportunity of gaining a wider dominion presented itself on the death of his second cousin, Edward the Confessor, king of England. When this event took place he laid claim to the English crown, alleging that Edward had bequeathed it to him. To enforce his claim he invaded England, and the victory of Senlac or Hastings, in which his rival Harold was killed, ensured his success (1066). On the following Christmas Day William was crowned, after tumultuary election on the part of the English nobles, and took the customary coronation oath. His first measures were mild: he sought to ingratiate himself with his new subjects, preserved his army in strict discipline, confirmed the liberties of London and other cities, and administered justice impartially. On his return to Normandy, however, the English, being treated by the Norman leaders like a conquered people, revolted and a conspiracy was planned for the massacre of all the Normans in the country. On this intelligence William returned, and began with a show of justice by repressing the encroachment of his followers; but on reviving the Danegelt, which had been abolished by Edward the Confessor, the discon-

WILLIAM

tents were renewed. These he repressed with his usual vigor, and a temporary calm succeeded. The resistance of two powerful Saxon nobles, Edwin and Morcar, who had formed an alliance with the kings of Scotland and Denmark, and with the prince of North Wales, soon after drew William to the north, where he obliged Malcolm, king of Scotland, to do homage for Cumberland. From this time he treated the English like a conquered people, multiplied confiscations in every quarter, and forced the native nobility to desert the country in great numbers. In 1069 another formidable insurrection broke out in the north, and at the same time the English resumed arms in the eastern and southern counties. William first opposed the storm in the north, and executed such merciless vengeance in his progress that the whole country between York and Durham was turned into a desert; and above 100,000 of both sexes and all ages are said to have perished. There being now scarcely a landed proprietor who had not incurred the forfeiture of rebellion, he put into execution his plan of introducing a total alteration of the state of English law and property, by dividing all the lands into baronies and adopting the feudal system in regard to land tenure and services. He also reduced the ecclesiastical property to a similar system, and, to prevent resistance from the clergy, expelled most of the English church dignitaries, and placed Normans or other foreigners in their stead, Lanfranc being made archbishop. Still further to humble the English, he caused French to be used in the courts of justice and in law proceedings, and ordered it to form a leading part of instruction in all the schools throughout the realm. In 1076 he received a demand from Pope Gregory VII., requiring him to do homage for his kingdom, and to pay the accustomed tribute from England to the Holy See. William denied the homage; nor would he allow the English prelates to attend a general council summoned by Gregory, but consented to the levy of Peter's pence. Toward the end of his reign he instituted that general survey of the landed property of the kingdom, the record of which still exists under the title of 'Domesday Book' (q.v.). The manner in which he laid waste a large district in Hampshire, where he demolished villages, churches, and convents, and expelled the inhabitants for 30 miles round, merely to form the New Forest for hunting, exhibits his indifference to the suffering of his subjects, as well as his love of the chase, which he further protected by a most severe code of game-laws. In 1087 he went to war with France, whose king had encouraged a rebellion of Norman nobles, entered the French territory, and committed great ravages, but, by the starting of his horse at Mantes, received an injury which caused his death, at the Abbey of St. Gervais, near Rouen (1087). He left three sons—Robert, to whom he bequeathed Normandy; William, who inherited England; Henry, who received only his mother's property, and five daughters. William the Conqueror was the most powerful sovereign of his time. He possessed superior talents, both political and martial, and employed them with remarkable vigor and industry. His passions were, however, strong; his ambition severe and merciless; and his love of sway often led him to dis-

regard all restraints of justice and humanity. Consult: Lappenberg, 'England under the Anglo-Norman Kings,' translated by Thorpe (1857); Palgrave, 'Normandy and England,' Vol. III. (1864); Freeman, 'History of the Norman Conquest of England' (1867-71); Stubbs, 'Constitutional History of England' (1874); Green, 'Conquest of England' (1884); Freeman, 'William the Conqueror' (1888); Round, 'Feudal England' (1895).

William II., surnamed RUFUS, from his red face, king of England: b. Normandy 1056; d. New Forest, Hampshire, 2 Aug. 1100. He was the third son of William I. and was sent to England by his father the day before the death of the latter with a recommendation to the barons and bishops that he should be the Conqueror's successor. His wishes were respected and William Rufus was crowned at Westminster 26 Sept. 1087. The division of England and Normandy did not, however, please the great barons, who possessed territories in both; and a conspiracy was formed for effecting the deposition of William in favor of his brother Robert; but the conspiracy was repressed with great vigor; the confederate nobles were forced to withdraw to Normandy, and their English estates were confiscated. It is worthy of notice that in this instance a Norman ruler was supported by his English subjects against his Norman ones. Once firmly seated on his throne, William forgot his promises to the English; and the death of Lanfranc, archbishop of Canterbury, freeing him from an authority which he respected, he extended his rapacity to the church, and seized the temporalities of vacant bishoprics and abbeys, to which he delayed appointing successors. In 1090 he made an incursion into Normandy, to retaliate on his brother Robert; but a reconciliation was effected between them. In 1096 Robert mortgaged his dukedom to William for the sum of 10,000 marks to enable him to fit out an expedition and join the crusaders in the Holy Land. William accordingly took possession of Normandy and Maine, although in the case of the latter he was not allowed to do so without a struggle. William Rufus met his death while hunting in the New Forest. His body was found pierced by an arrow, which is generally believed to have been shot, whether accidentally or purposely cannot be said, by a French gentleman named Walter Tyrrel. Tyrrel immediately galloped to the coast, and embarked for France, where he joined the crusaders. The body was interred without ceremony at Winchester. This event took place when the king was in the 44th year of his age, and 13th of his reign. William Rufus possessed vigor, decision, and policy, but was violent, perfidious, and rapacious. Consult Freeman, 'Norman Conquest of England,' Vol. V. (1876), and his 'Reign of William Rufus' (1882).

William III., king of England and hereditary stadtholder of Holland: b. The Hague 4 Nov. 1650; d. Kensington, England, 8 March 1702. He was the son of William II. of Nassau, prince of Orange, and his mother was Henrietta Mary Stuart, daughter of Charles I. of England. Educated by the grand pensionary John De Witt, he gained the love of the people, who in 1672, when Louis XIV. invaded the republic, appointed him at once captain-general, grand-

WILLIAM

admiral, and stadtholder of the United Provinces, after enforcing the abrogation of a resolution which De Witt had got passed in 1667, and which declared that in future no captain-general should at the same time be stadtholder. William's management of the war against France was masterly. In the campaign of 1673 he opened the sluices in the dikes around Amsterdam, inundating the whole of the neighboring district and forcing the French to retire. He was able to keep the enemy in check, and by his policy engaged the empire, Spain, and Brandenburg to take part with Holland, so that at the Peace of Nijmegen in 1678 the integrity of Holland was respected. William's whole policy was directed against Louis XIV., for whom he entertained a personal hatred, and to curb the ambition of the French monarch he instituted the league of Augsburg, July 1686, between the emperor, Spain, Sweden, and Holland, to which Denmark and some German princes also acceded. His wife, Mary, whom he had married in 1677, was the daughter of James II. of England, and presumptive heiress to the throne. Unexpectedly James' second wife gave birth to a son, 10 June 1688, and the greater part of the Parliament and of the nation now feared that the bigoted James would introduce Roman Catholicism as the state religion, and subvert the constitution. Rumor also asserted that the prince was supposititious. The Episcopalians and Presbyterians in England, under these circumstances, united, in order, by the aid of Holland, to give Mary the succession to the throne. William foreseeing that England, by the policy of his father-in-law, would become more and more closely connected with France, joined with the great majority of the British nation; and the pensionary Fagel persuaded the States-General to support him with ships and troops for the preservation of British freedom and the Protestant religion. William arrived suddenly at Torbay, 5 Nov. 1688, with a fleet of 500 sail, ostensibly equipped against France, and with 14,000 troops. Upon his landing a great part of the nobility immediately declared for him; and James' soldiers by degrees went over to him. In December the king fled with his family to France, after which William made his entry into London. The two houses of Parliament in convention now declared that James II. had broken the fundamental compact between the king and the people, and by withdrawing from the kingdom had abdicated the government. On 13 Feb. 1689, Mary was proclaimed queen, and William, her husband, who had meanwhile gone over to the English Church, was proclaimed king. At the same time the declaration or bill of rights settled the limits of the royal power, and the order of succession. Scotland followed England's example; but in Ireland, whither Louis XIV. sent James with an army, the majority of the Roman Catholics maintained the cause of the deposed king. But William's victories over the army of James on the Boyne 1 July 1690, and at Aughrim, 13 July 1691, assisted by the clemency with which he treated the vanquished party, made him master of Ireland. In the war on the Continent he was less successful. At Steinkirk he was defeated by Marshal Luxembourg in 1692, and at Neerwinden by the same general in 1693; but always succeeded in wresting from the French

the fruits of their victories by skilful retreats and marches. Louis was finally compelled to acknowledge him as king of England at the Peace of Ryswick, in 1697. The Parliament insisted at that time on the disbanding of nearly the whole army, deeming a standing army incompatible with the security of the constitution. Soon after, the will of Charles II. of Spain, who had made the grandson of Louis XIV. his heir, induced William to arm all Europe against Louis in the great alliance of The Hague 7 Sept. 1701. But in the midst of these projects he broke his collar-bone by a fall from his horse between Kensington and Hampton Court, 21 Feb. 1702, and died in consequence of the accident. His wife, Mary, had already died childless in 1694. William's manners were too cold and ungracious to allow him to be popular with the English people. Under a reserved exterior he concealed a strong love of renown and power, and to obtain the majority of votes in Parliament made use of bribery. Immersed in politics and war, he had neither leisure nor inclination for literature and art. In conversation he was grave and unattractive; but in business, penetrating, quick, and decided; in danger, undaunted; in difficulties, unshaken; in war, bold without ostentation. Consult: Burnet, 'History of His Own Times'; Trevor, 'Life and Times of William III.' (1835); Macaulay, 'History of England'; Hallam, 'Constitutional History'; Ranke, 'History of England' (1875); Traill, 'William III.' (1888); Hippold, 'William III., Prinz von Oranien, Erbstatthalter von Holland, König von England' (1900).

William IV., king of Great Britain and Ireland, third son of George III.: b. 21 Aug. 1765; d. Windsor 20 June 1837. From 1779 to 1790 he served in the navy, and after quitting active service was raised successively to all the higher grades of naval command, becoming in 1801 admiral of the fleet. In 1780 he was raised to the peerage with the title of Duke of Clarence. He frequently spoke in the House of Lords, and held the office of lord high-admiral (1827-8). He became heir presumptive to the throne in 1827 and succeeded his brother George IV. as king 26 June 1830. On his accession he retained the ministers then in office with assurances of his confidence in their zeal and ability. In the new Parliament, which met in November, the ministry, being left in a minority on a motion of Sir H. Parnell for referring the civil list to a select committee, immediately sent in their resignation; and a Whig administration was formed with Earl Grey at its head. The great events which render his reign memorable are the passage of the reform act, the abolition of slavery in the colonies, and the reform of the poor-laws. William IV. married in July 1818, Adelaide, sister of the Duke of Saxe-Meiningen, by whom he had no surviving children. He had, however, a large family by Mrs. Jordan, the celebrated actress, who was for many years his mistress, while Duke of Clarence. Her liaison with the duke lasted from about 1790 till 1811, when an arrangement was made by which she and her family were provided for. William IV. was succeeded by his niece Victoria. Consult Fitzgerald, 'Life and Times of William IV.' (1884); Walpole, 'History of England from the Conclusion of the Great War in 1815' (1878-86).

WILLIAM

William I., emperor of Germany and 7th king of Prussia: b. Berlin 22 March 1797; d. there 9 March 1888. He was the second son of Frederick William III. and Louisa of Mecklenburg-Strelitz, and from his earliest years was trained in military exercises. In the campaign of 1813-14 he joined the Prussian forces as captain, receiving then, for bravery in the field, the "Cross of St. George" from the Czar Alexander. On the death of his father in 1846 he became heir presumptive to the throne, and received the title of Prince of Prussia. On the outbreak of the revolution in 1848 he quitted Berlin for England, but was soon recalled and in the following year proceeded against the insurgents with military vigor and suppressed the insurrections in Baden and the Palatinate. His brother having become incapable of ruling, William (1857) was appointed regent, and in January 1861 became king, being crowned at Königsberg in October of the same year. With the assistance of Otto von Bismarck (q.v.) as president of the cabinet, and Von Roon as war minister, he demanded from the nation a large scheme of army reform, and his foresight in this matter was justified by the Prussian successes in the war with Denmark (1864), and the complete overthrow of Austria at Sadowa (1866). The latter war had been brought about by the diplomacy of Bismarck, who now proceeded to form a North-German Confederation with King William as its head, and to conclude a treaty of alliance, offensive and defensive, with the South German States. This growing power of Prussia provoked the jealousy of France, and a crisis was reached in the negotiations concerning the Spanish crown. War was proclaimed between Prussia and France (1870), and the South-German States having declared in favor of the former, King William led the combined German forces through the campaign, which resulted in the defeat of Napoleon at Sedan, and finally in the siege and capitulation of Paris. Meanwhile the North-German Parliament, uniting with the German princes, desired the king to become German emperor. This honor he accepted, and he was crowned as Emperor William I. at Versailles on 18 Jan. 1871. After the conclusion of peace with France, and having entered Paris with his army, the emperor returned to Berlin amid great enthusiasm. The latter part of his reign was passed in consolidating the power of the new German empire, and in parliamentary and political conflicts with the Catholic, Liberal, and Socialist parties in the state. (See GERMANY.) His life was attempted several times. Among biographies are those of Forbes (1888); G. B. Smith (1887); Strauss (1887); Simon (French, 1887, Eng. trans.); Marcks, 'Kaiser Wilhelm I.' (1899). Consult also Von Sybel, 'Die Begründung des Deutschen Reichs' (1889-94; Eng. translation 1890-2); Malletson, 'Refounding of the German Empire' (1892); Krause, 'Growth of German Unity' (1892); Oncken, 'Das Zeitalter des Kaisers Wilhelm' (1890-2).

William II. (Friedrich Wilhelm Victor Albert), German emperor and king of Prussia, son of Frederick III. and Victoria, Princess Royal of Great Britain, and grandson of William I.: b. Berlin 27 Jan. 1859. At birth he suffered an injury of the left arm which would have disqualified a private person for the army, but

nevertheless he received a thorough military education. In 1869 he was enrolled in the army as 2d lieutenant, in 1874 entered the gymnasium at Cassel, and three years later, as 1st lieutenant, was admitted to the University of Bonn, where he remained until 1879, his principal studies being political science and law. He then entered upon actual military service, to which, after his marriage (27 Feb. 1881) to Princess Victoria of Schleswig-Holstein-Sonderburg-Augustenburg, he devoted himself with all earnestness, and in 1885 became colonel of the Hussars of the Guard. In spite of his physical defect he was now one of the most capable and dashing officers in the army. He also displayed talents in literature and art, which he has pursued in various directions. Strengthened by physical culture and the diversions of hunting and other sports in which he excelled, he came to the throne (15 June 1888) well trained in mind, inured to exacting labors, and filled with self-reliance and enthusiasm. Statecraft he had learned in the school of Bismarck (q.v.), and his political and personal ideals were imbued with veneration for his grandfather, whose conviction of "divine right" he embodied in his own view of the imperial office. His personal aggressiveness and military methods had given rise to popular fear of indiscretions whereby he might endanger the peace of Germany and of the world, but from the first he has vigorously repelled those suspicions of his motives which have led to his designation as the "War-lord," and against which his conduct in the main has thus far been a vindication. During the mortal illness of his father when Crown Prince, William was called upon to repudiate a charge of conspiracy to keep him from the throne. His own behavior in the three months of his father's reign betrayed no want of filial devotion. Upon his accession William at once asserted his ideas of personal rulership, which he has maintained in theory, and in practice has relaxed only in submission to demands of policy. He has actively concerned himself with every department of German life, and his personal sway has been qualified only by the limitations of the constitution and of public opinion. By travel, in which he has visited all the principal capitals of Europe, he has familiarized himself with international affairs, and he is an expert in world-politics. When Moltke died the emperor declared that he had "lost an army," but when he quarreled with Bismarck he showed no misgivings at the loss of the masterful chancellor and reputed creator of the empire, whose retirement he virtually compelled in March 1890. And indeed by this act, cleverly characterized by his critics as "dropping the pilot," he made himself more distinctly master of the ship of state. Since then his able chancellors—Caprivi, Hohenlohe, Bülow—have been compliant to the imperial will. Shortly before Bismarck's death the emperor sought reconciliation, and their friendship was partially restored. In some things, notably in maintaining the Triple Alliance, the emperor has followed the policy of Bismarck. William has measured his strength against all liberalizing parties, and his early solicitude for the laboring classes has latterly seemed lost in his bitter antagonism to socialistic elements. Bismarck's *Kulturkampf* legacy William has sagaciously disposed of through concessions which he has turned to

WILLIAM II, EMPEROR OF GERMANY.

WILLIAM

profit by making an implicit alliance of the Vatican and the German schools in his anti-revolutionary policies, and by remodeling the schools themselves.

With all his alleged autocratic tendencies William has sought above everything the aggrandizement of Germany, her industrial and commercial supremacy, colonial expansion, and primacy among the great Powers. He has extended the imperial influence to Turkey and Asia Minor, and strengthened German interests in the Far East and in Africa and South America. He holds the press to as strict account as he can; the army and navy, which he would make superior to all others, he keeps in strong control; but his attitude at present indicates no menace, rather a promise of protection to the cause of peace, which on more than one occasion he has doubtless aided in preserving. Herein his conduct has been less aggressive than many of the speeches in which he has addressed himself through Germany to the world. He is admittedly a most remarkable figure among the men and rulers of his time, and in his future career the whole world cannot but feel a profound and cordial interest. The sending of his brother, Prince Henry of Prussia, to the United States, in 1902, did much to promote friendly sentiment, and the emperor's good will has been further shown in his gifts to the American people and to American institutions. (1894); Lowe, 'The German Emperor, William II.' (1896); also 'The Kaiser's Speeches,' edited by W. von Schierbrand (1903).

JOHN H. CLIFFORD,

Editorial Staff, 'Encyclopedia Americana.'

William I., prince of Orange, count of Nassau, surnamed the SILENT: b. Castle of Dillenburg, Nassau, 16 April 1533; d. Delft, Holland, 10 July 1584. He was the eldest son of William, count of Nassau, and Juliana, countess of Stolberg, and was educated in the Roman Catholic faith by Maria, queen of Hungary, sister of Charles V. He spent nine years in attendance on the person of the emperor, who had so high an esteem for his spirit, prudence, and intelligence, that he asked his opinion respecting the most important matters, and when he was but 22 entrusted him with the chief command of the army in the Netherlands, in the absence of Philibert, duke of Savoy. He also recommended him to his successor, Philip II., who, however, regarded him with distrust. As Cardinal Granvella had now the entire confidence of Philip, and Margaret of Parma, who was charged with the government of the Netherlands, was obliged to do whatever Granvella suggested, especially with respect to the introduction of the Spanish inquisition, and the erection of new bishoprics, the Count of Egmont, the Prince of Orange, and the Count of Horn represented to the king in writing, that unless the cardinal were speedily recalled, his violence would drive the country to rebellion. Though Philip looked on this step as treason, he concealed his anger, and recalled the cardinal (1564). After the remonstrance offered in 1566 by 300 noblemen (the Gueux), with Count Louis of Nassau, the brother of William, at their head,

against the introduction of the Inquisition and the establishment of new bishoprics, had been rejected and the Duke of Alva had been appointed governor of the Netherlands, William had a meeting with Egmont, Horn, his brother Louis, and others at Dendermond, to deliberate on the means of averting the threatening danger. The majority advised an armed resistance, but this proposal came to nothing on account of the opposition of the Count of Egmont. The prince, with his family now went to his castle at Dillenburg. Alva arrived in the Netherlands in 1567, and many men of consequence, including Egmont and Horn, were immediately arrested. In the beginning of 1568 he caused the prince and others, who had retired from the country, to be summoned before the Council of Twelve. The prince did not appear, in consequence of which Alva declared him an outlaw, confiscated his property, and removed his son Philip William, from the University of Louvain, and sent him as a hostage to Spain. The Prince of Orange now determined on waging war against Alva. In a document issued in the summer of 1568, and called his "justification" he gave the reasons of his conduct and publicly professed the Protestant religion. In consequence of this he received aid in money and troops from several Protestant princes. William now raised an army of 24,000 Germans, who were joined by 4,000 French soldiers, conducted his forces with great skill across the Rhine and Meuse, entered Brabant, and defeated a division of the hostile army, but was unable to bring the Duke of Alva, who threw himself into the fortresses, to an engagement, or to excite the people, who feared the Spaniards, to a general insurrection. His army now dispersed. He then took part in an expedition to France against the Catholic party of the Guises (1569). In France Admiral Coligny had advised him to fit out privateers against the Spanish, and establish himself particularly in Zealand and Holland, from which the Spaniards would hardly be able to drive him. The prince followed this advice, and the privateers made themselves masters, in 1572, of the town and harbor of Briel, on the island of Voorn, and also took Flushing. As Alva's tyranny became more intolerable, and the people were exasperated by new exactions, several cities of Holland, Zealand, Overijssel, and Gelderland publicly declared for the Prince of Orange. Relying on the assistance of France, which Admiral Coligny had promised to obtain for him, William crossed the Rhine, but the news of the massacre of St. Bartholomew, deprived him for the time of all hope of French aid. He then retired into the province of Holland, which steadfastly supported him. He now resumed negotiations with France, and obtained a treaty in which France promised to support him, provided that it should receive the protectorate over all the provinces of the Netherlands, which he succeeded in wresting from the Spaniards. At the end of 1573 Alva was recalled and replaced by Requesens. In 1574 Louis and Henry of Nassau, William's brothers, made an effort to join him, but were totally defeated by Requesens at Mookerheide, near Nijmegen. Both of William's brothers fell on the field of battle. This blow was compensated by the relief of Leyden, at that time hard pressed by the enemy. The raising of the siege of Leyden saved the province of Holland for the time, but

WILLIAM

the Spanish were still formidable, and Holland might have been completely crushed had it not been for the death of Requesens, which took place in March 1576. After this event William succeeded in bringing about the so-called pacification of Ghent (8 Nov. 1576), in which nearly all the provinces of the Low Countries united to expel the foreign troops, and promised mutual toleration in matters of religion. The new stadtholder, John of Austria, sought to break the force of the union by granting, in the perpetual edict, almost all the demands of the people (1577), but his conduct soon manifested his insincerity and the states of Antwerp then called the Prince of Orange to their aid. The people received him with acclamations in Brussels, and he was appointed to the rank of lieutenant-general. The war was now renewed, and by the victory at Gemblours in the end of January 1578, the Spaniards recovered their superiority in the Walloon provinces, which were zealously Catholic. In 1579 Don John of Austria died, and the king appointed Alexander Farnese of Parma as his successor. The policy of Farnese succeeded in gaining over to the king the southern provinces, and the prince, therefore, brought the five northern provinces, Holland, Zealand, Utrecht, Gelderland, and Friesland, into closer connection by the union of Utrecht, 23 Jan. 1579, and thus laid the foundation of the republic of the United Netherlands. In 1580 the king, finding it impossible to triumph over William by fair means, put a price upon his head. This step induced the united provinces to renounce their allegiance to Philip, and William was offered the dignity of sovereign count of Holland and Zealand, which he accepted. But the edict of Philip proclaiming a reward for his life was not without effect. In 1582 an attempt was made by a Spaniard named Jauregu to assassinate him at Antwerp, and a second attempt, made at Delft on 10 July 1584, by a Burgundian fanatic Balthasar Gerard, succeeded. William of Nassau was four times married. Maurice of Nassau, who distinguished himself as a general in the Thirty Years' war, was one of his sons, and William III. of England, a grandson of his. Consult: Gachard, 'Correspondance de Guillaume le Taciturne' (1847-66); Motley, 'The Rise of the Dutch Republic' (1856); Klose, 'William I. von Oranien' (1864); Juste, 'Guillaume le Taciturne d'après sa Correspondance et ses Papiers d'Etat' (1873); Putnam, 'William the Silent, Founder of the Dutch Republic' (1895); Frederic Harrison, 'William the Silent' (1897).

William I., Frederick, king of the Netherlands, grand duke of Luxembourg, prince of Orange and duke of Nassau: b. The Hague 24 Aug. 1772; d. Berlin 12 Dec. 1843. He was the eldest son of William V., Prince of Orange-Nassau, and was married to Friederike Luise Wilhelmine, daughter of Frederick William II. of Prussia, in 1791. He distinguished himself in the wars with the French republic, and became an exile with his father, the hereditary stadtholder of the Dutch republic, in 1795, and for several years lived at Fulda. After his father's death, in 1806, he succeeded to the duchy of Nassau, and joining the Prussian army against Napoleon was captured at Jena and his possessions confiscated. Released soon after he fought against the French at Wagram. At

the Congress of Vienna the kingdom of the Netherlands was formed, composed of Holland and Belgium, and 16 March 1815, William I. was proclaimed king. His hereditary estates having been given to Prussia and Nassau, he received in exchange the grand duchy of Luxembourg. Belgium was, however, separated from Holland by the revolution of 1830, and as William was unwilling to recognize its existence as an independent state, he became unpopular. He continued to protest up to 1839, and the next year abdicated in favor of his son, retiring to Berlin at the same time with an immense fortune.

William II., Frederick George Louis, king of the Netherlands: b. The Hague 2 Dec. 1792; d. 17 March 1849. He was the eldest son of the preceding. He distinguished himself in the Peninsular war under Lord Wellington, and also commanded the army of the Netherlands at the battle of Waterloo. In 1816 he was married to the grand duchess Anna Paulovna, sister of Alexander I. of Russia. His reign commenced from his father's abdication in 1840, but although he brought order out of the financial chaos caused by his father, he was by nature opposed to political reform. In 1848 events obliged him to consent to an entire reorganization of the government, but his death took place before the new constitution could go into effect.

William III., Alexander Paul Frederick, king of the Netherlands: b. The Hague 19 Feb. 1817; d. Loo 23 Nov. 1890. He was the eldest son of the preceding and his reign was chiefly distinguished by undertakings of internal improvement. Under his rule, the kingdom enjoyed uninterrupted peace, and material prosperity increased. He carried out the parliamentary reforms instituted in 1848 and in 1862 decreed the abolition of slavery in the Dutch West Indies. In 1866 the Dutch province of Limburg, a member of the Germanic Confederation from 1815, was restored to the Netherlands and by the treaty of 11 May 1867, the grand duchy of Luxembourg was declared neutral territory under the sovereignty of the house of Orange-Nassau. While Prince of Orange, he married in 1839, the Princess Sophia Frederica Matilda, daughter of the late King William I., of Wurtemberg. They had two sons, William Nicholas Alexander Frederick Charles Henry, Prince of Orange (b. 4 Sept. 1840; d. 11 June 1879); and William Alexander Charles Henry Frederick (b. 25 Aug. 1851; d. 21 June 1884), the last male heir of the house of Orange. In 1879 King William was married to Emma, Princess of Waldeck-Pyrmont, their daughter Wilhelmina becoming heir to the throne.

William I., surnamed **THE LION**, king of Scotland: b. 1143; d. Stirling 1214. He was a grandson of David I., and brother of Malcolm IV., whom he succeeded in 1165. The source of his designation is one of the mysteries of history. His predecessors had long contested with the kings of England the sovereignty of Northumberland and other districts of the north of England, but under Malcolm these claims were virtually abandoned and the king of Scots received, as an equivalent for them, the earldom of Huntingdon and other valuable estates. William still coveted the Northumbrian region, and while attending Henry II. of England in his wars upon the Continent, is supposed to

WILLIAM OF MALMSBURY — WILLIAM AND MARY COLLEGE

have asked for a portion of the disputed territory. On being refused he invaded the district after the example of his ancestors, but on 13 July 1174 fell into the hands of the English. For security he was conveyed to Normandy, and there consented, as the price of his liberation, to perform that homage for his kingdom which the English kings so long vainly required from the government of Scotland. The treaty of Falaise, as the arrangement was termed, from the place of its adjustment, was revoked in 1189 by Richard I. of England in consideration of a payment of 10,000 marks, needed for his expedition to Palestine. William had several disputes with the Church, but was one of the early benefactors of the regular ecclesiastics, and founded in 1178 the great abbey of Arbroath, which he dedicated to Saint Thomas a Becket.

William of Malmesbury, māmz'bēr'i, English historian: b. probably in Somersetshire, about 1090; d. Malmesbury, Wiltshire, about 1143. He was educated at the Benedictine Abbey of Malmesbury of which he subsequently became librarian and precentor, and from which his name is derived. His works are in Latin and are of great historical value. They include: 'De Gestis Regum Anglorum,' a general history of the kings of England from 449 to 1128; 'Historia Novella,' containing the narration to 1142; 'De Gestis Pontificum Anglorum,' an ecclesiastical history of England down to 1123; 'Vita S. Dunstan'; 'Vita S. Wulfstani'; etc. The best edition of his English and Church histories is that of Stubbs in the *Rolls Series* (1887-8). Consult Birch, 'Life and Writings of William of Malmesbury' (1874); Stubbs' Prefaces in the *Rolls Series*; Norgate, 'England Under the Angevin Kings,' Vol. I. (1887).

William of Newburgh, English chronicler: b. Bridlington, Yorkshire, about 1136; d. Newburgh, near Coxwold, Yorkshire, about 1198. He was educated, lived all his life, and died in the Augustinian Abbey of Newburgh. He is one of the chief authorities for the reign of Henry II. His 'Historia Rerum Anglicarum' covers the period from 1066-98, is written in five books, and is highly valuable as a broadminded, just, and clear presentation of the happenings of the times, though his statements are not always accurate. His other works consist of three sermons. Consult Howlett in the *Rolls Series*, 'Chronicles of Stephen, Henry II., and Richard I.' (1884).

William of Tyre, Syrian historian and archbishop: b. probably in Syria, about 1137; d. about 1184. He was educated at Antioch and Jerusalem, and in 1175 was made archbishop of Tyre. He was one of the six bishops who represented the Latin Church of the East at the Lateran Council in 1179. His 'Historia Rerum in Partibus Transmarinis Gestarum' is one of the best histories of mediæval times, and is the principal authority for the history of the Latin kingdom in the East from 1127-84. He also wrote 'Historia de Orientalibus Principibus.'

William of Wykeham, wīk'am, English prelate, architect, and statesman: b. Wykeham, Hampshire, 1324; d. South Waltham, Hampshire, 24 Sept. 1404. He received a liberal education from the lord of the manor of Wykeham, and was afterward recommended by him to the

notice of Edward III., who made him chief keeper and surveyor of the several of the royal castles. He built Windsor Castle, and afterward, taking orders, held various ecclesiastical posts, becoming bishop of Winchester in 1367. He was lord chancellor of England 1367-71, founded in 1373 a grammar school at Winchester, which still exists as Winchester College, and New College, Oxford, which he completed in 1386. He was lord chancellor for the second time 1389-91 and rebuilt the nave of Winchester Cathedral in the Third Pointed manner 1395-1405. He is buried in a magnificent chantry chapel in the south arcade of the nave at Winchester. Consult 'Three Chancellors' (1860); and 'Lives,' by Lowth (1758); Moberly (1887).

William and Mary College, located at Williamsburg, Va. It was chartered in 1693, thus being the second oldest college in the United States; but an attempt was made to found a college in Virginia as early as 1619 when a grant of land for a "seminary of learning" was made by the Virginia Company; a collegiate school was established at Charles City in 1621, but closed on account of Indian troubles in the next year. In 1635 Benjamin Symes established a free school in Elizabeth City County, the first in the thirteen colonies. In 1660 the Virginia assembly voted a grant of land for a college, but the disturbed condition of England at that time, and the disorders within the colony, prevented any further progress toward establishing an institution of higher learning until in 1691, when Rev. James Blair was sent to England to obtain a charter from the crown. In this he was successful, the charter being signed 8 Feb. 1693. Certain lands, a duty on the exports of tobacco, and other funds were appropriated to the use of the college. During the Revolutionary War the college lost the larger part of its endowment, the buildings were occupied by the British and the American and French troops, and the college was closed for a short time in 1781. After the Revolution, the college was reorganized and received a grant of land from the Virginia legislature; George Washington served as chancellor from 1788-99. During the Civil War the college was closed after 1861; about 90 per cent of its students enlisted in the Confederate service. It was occupied by the Federal troops and most of its buildings and property destroyed. In 1869 the main building was restored, and the college again opened, but under serious embarrassment; so serious did the financial difficulties become that its sessions were suspended in 1882, until 1888, when the State legislature appropriated \$10,000 a year, later increased to \$15,000. In 1893 the college received \$64,000 from Congress as indemnity for loss suffered during the Civil War.

The college has always given history and political science a recognized place in its curriculum, and was the first American college to establish chairs of law and history. Partially perhaps for this reason, its influence has always been felt in State and national history; it numbers among its graduates some of the leading men of the nation, including four presidents of the United States, Jefferson, Monroe, Harrison, and Tyler, also Chief Justice Marshall, Edmund Randolph, and General Scott. The first chapter of Phi Beta Kappa was established at William and Mary in 1776. The college was also the

WILLIAM HENRY — WILLIAMS

first to introduce the elective system which was done in part in 1779 under Jefferson's guidance. In 1819 Jefferson declared in a letter to Francis Eppes that at William and Mary the student could pursue the course of his choice. At this time there appear to have been two classes of students—"regulars and irregulars." The first class took a prescribed course for A.B., the latter followed their own inclinations, and attended the schools of their own selection. The college was also the first to try the honor system, and a remarkable degree of freedom was permitted the students in the lecture room, and on examination. They were neither watched nor spied upon, and their word was taken as conclusive on any subject. There are now two courses offered, the Collegiate and the Normal. The Collegiate course is entirely elective in accordance with the group system; three degrees are conferred, A.M. (for graduate work), A.B. and B.L., according to the subjects elected. The Normal course is two years in length, to which is added one year's practice work in the Matthew Whaley Model and Practice School. The campus consists of 42 acres upon which there are eight buildings. In the centre is the main college structure. Though it has passed through three fires, the walls are the same as were originally put up in 1693. They are, therefore, the oldest college walls in the United States. The lawn in front of the college is covered with beautiful trees, and the buildings are furnished with electric lights, artesian well water, and new equipment. The college receives annually from the legislature \$25,000. The students in 1904 numbered 165, and the faculty 12.

LYON G. TYLER, LL.D.,

President of William and Mary College.

William Henry, Fort, in the town of Caldwell, N. Y., at the head of Lake George (q.v.). In August 1757, it was taken from the English by a force of French and Indians under Montcalm.

William Jewell College, located in Liberty, a suburb of Kansas City, Mo. It was founded in 1849 by the Baptists of Missouri; Dr. William Jewell of Columbia, Mo., was one of the leaders in the movement for the establishment of the college, and contributed \$10,000 in lands toward the endowment, hence the college was named for him. It was opened to students in 1850, and on account of financial difficulties was closed in 1855-7; just as the college was becoming prosperous, the Civil War again forced the work to suspend from 1861 to 1868; for a part of that time the building was occupied by the Federal troops. Since 1877 the endowment has been raised to over \$200,000. The college offers four courses or groups, leading to the degree of A.B. Some studies are required in all groups, and some are free electives. The curriculum includes several theological courses, completion of which by arrangement with the Southern Baptist Theological Seminary at Louisville, Ky., entitles the student to credit at that seminary. The degree of A.M. is conferred for graduate work. There are also courses in elocution and oratory and music, and an Academic Department. A college band and a college orchestra are maintained. There are 44 scholarships. The student organizations include four literary societies, Philharmonic (a musical society), a Young Men's Christian Association, and mis-

sionary societies. The buildings include Jewell Hall (the original building), Vardeman Hall, Brown Hall, Wornall Hall, Ely Hall, The Cottages, and the gymnasium. The library in 1904 contained 10,000 volumes; the students numbered 345, and the faculty 21.

William Penn Charter School, a secondary day school for boys, located at Philadelphia. In 1683 the governor and council of the province engaged a schoolmaster (Enoch Flower) for "the instruction of the youth" of Philadelphia; from this grew the Charter School, founded in 1689 and incorporated in 1698 by the council and lieutenant-governor as "the public school founded in Philadelphia at the request, costs, and charges of the people of God called Quakers." Although supported by the Quakers, it was open to all, and for more than 60 years continued to be the only public place for instruction in the province. In 1701 Penn was asked to confirm the lieutenant-governor's charter by one under his own hand and seal. This he did on the same day that he chartered the city itself. The school therefore enjoys, in this regard, a unique distinction. The two subsequent charters issued by Penn, one in 1708 and the other in 1711 (the last the legal one under which the board now works) rendered broader and more far-reaching the measures for the school's future development. The school was entirely emancipated from denominational control, and the title of the corporation changed by omitting the words: "at the request, costs and charges of the people of God called Quakers," the title in the final charter standing: "The Overseers of the Public School founded by Charter in the Town and County of Philadelphia in Pennsylvania" (the word "public" being used in the English sense, open to all willing to pay the fees). The school premises are now located in the heart of the city, and taken with the beautiful playing fields in the suburbs of the city, presented to the school in 1903, are valued at \$250,000; and the scholarship funds amount to about \$50,000. It is purely a day college preparatory school for boys, and has for years been famed for both its high standard of scholarship and the intelligent care devoted to physical training. In 1903-4 the students numbered over 500, it being the largest boys' day school of its class in the United States.

RICHARD M. JONES, LL.D.,

Head Master.

William Tell (Wilhelm Tell), the last completed drama of Schiller, was written in 1804, one year before his death. It is considered one of his finest works, being the most mature expression of that idea of freedom with which he had opened his poetic career in 'The Robbers' 20 years before. But whereas Karl Moor was warring against the existing order of things, the Swiss were fighting for the preservation of their ancient rights. Although the play is named after Tell, he is merely the nominal hero. The real protagonists are the whole people. A drama by James Sheridan Knowles, entitled 'William Tell,' was produced by Macready in 1825, and the same theme forms the libretto of Rossini's 'Guillaume Tell' (1829).

Williams, wil'yamz, **Alpheus Starkey**, American soldier: b. Saybrook, Conn., 20 Sept. 1810; d. Washington, D. C., 21 Dec. 1878. Graduated from Yale in 1831, he studied in the

WILLIAMS

law school there in 1831-3, and in 1830 began legal practice in Detroit, Mich. There he held local offices, and in 1840-4 was probate judge of Wayne County. He became proprietor of the *Daily Advertiser* of Detroit in 1843, and remained its editor until 1848. During the Mexican War he was lieutenant-colonel of the 1st Michigan volunteers. In May 1861 he received the commission of brigadier-general of volunteers. Later he was a division commander in the Shenandoah, and in 1862 became temporary commander of the 12th corps, which he directed until April 1863, leading it at South Mountain and Antietam. He was also in command of a corps at Gettysburg and, after his transfer to Tennessee, at Lookout Mountain. After commanding a division of the 20th corps in Sherman's Atlanta campaign, he was appointed in November to command that corps, and he led it in the "March to the Sea," and the campaign in the Carolinas. Upon the capture of Savannah he was brevetted brigadier-general of volunteers. Mustered out in January 1866, he was minister to San Salvador in 1866-9, and member of Congress in 1875-8. In 1870 he was Democratic candidate for the governorship of Michigan.

Williams, Annie Bowles "Jak," American writer of juvenile tales: b. Connecticut 1840. She published 'Birchwood' (1885); 'The Fitch Club'; 'Profesor Johnny' (1887); 'Rolf and His Friends'; 'Who Saved the Ship?'; 'The Giant Dwarf'; 'The Riverside Museum.'

Williams, Arthur Llewellyn, American Protestant Episcopal bishop: b. Owen Sound, Ont., 30 Jan. 1856. He received an academic education and engaged in the railroad business in Colorado for several years. He then studied theology and was graduated at the Western Theological Seminary, Chicago, in 1888. Admitted to the diaconate in 1888, and to the priesthood in 1889, he served as missionary in White River Valley, Colo., 1888-9, was rector of St. Paul's Church, Denver, 1891-2, and of Christ Church, Chicago, 1892-9. In October 1899 he was consecrated bishop-coadjutor of Nebraska.

Williams, Channing Moore, American Protestant Episcopal bishop: b. Richmond, Va., 18 July 1829. He was graduated from William and Mary College in 1853 and from the Theological Seminary at Alexandria, Va., in 1855. He took deacon's orders in 1853 and was ordained to the priesthood in 1857. He served as a missionary in China in 1857-66 and in the last mentioned year was consecrated bishop of Yeddo, Japan, resigning his bishopric in 1889, when he retired from episcopal duties, but continuing his missionary labors.

Williams, Edward (bardic name, Iolo MORGANWU), Welsh poet and Celtic scholar: b. Llancarvan, Glamorganshire, 1745; b. Flemingstone, Glamorganshire, 17 Dec. 1820. With Owen Jones and Pughe, he edited the 'Myvyrian Archaeology' (1801-7), and himself published 'The Fair Pilgrim, a Poem Translated from the Welsh' (1792); 'Poems Lyric and Pastoral' (1794); 'Psalms of the Church in the Desert' (1812) in Welsh. To the 'Fair Pilgrim' he appended specimens of Druidical 'Triads,' which, after a long protracted controversy and on the non-production of their manuscripts, are commonly looked on as a literary forgery. Williams was a friend of Southey and

ranked foremost among Welsh poets of his time. His posthumous Welsh work, 'Secrets of the Bards of the Isle of Britain' (1829) was edited by his son, Taliessin Williams. Consult Waring, 'Recollections and Anecdotes of Edward Williams' (1850).

Williams, Eleazer, American missionary to the Indians: b. about 1788; d. Hogsburg, Franklin County, N. Y., 28 Aug. 1858. After obtaining a secondary education in Massachusetts, upon the outbreak of the War of 1812 he became a United States government agent among the northern Indians, and later fought in several actions and was severely wounded at Plattsburg (14 Sept. 1814). After the war he became a clergyman of the Protestant Episcopal Church, and for many years labored as a missionary among the Indians of the northern Wisconsin region. By many he was identified with Louis XVII. of France (q.v.), and on this subject much has been written from J. H. Hanson's article in 'Putnam's' for February 1853 to M. H. Catherwood's 'Lazarre' (1901). Among his writings were 'Caution against Our Common Enemy' (1815), and a translation into Mohawk of the 'Book of Common Prayer' (1853).

Williams, Ephraim, American soldier: b. Newton, Mass., 24 Feb. 1715; killed near Lake George, N. Y., 8 Sept. 1755. In early life he was a sailor, but in the war with France, 1740-8, served as captain of a New England company in Canada. He received from Massachusetts in return for his services a grant of 200 acres of land in the present townships of Adams and Williamstown and was made commander of all the frontier posts west of the Connecticut River. When hostilities broke out afresh he was put in command of a regiment and ordered to join the New York forces under Sir William Johnson, who were marching northward to attack the French. He was proceeding with a large body of soldiers to attack Dieskau's advance force, when the whole party was entrapped in an ambuscade of French and Indians, and at the first fire Col. Williams fell mortally wounded. While in camp at Albany he had made his will, bequeathing his property for the establishment of a free school in Massachusetts, which later became Williams College. In 1854 the alumni of Williams College erected a monument to his memory on the spot where he fell. See WILLIAMS COLLEGE.

Williams, Francis Churchill, American author, son of Francis Howard Williams (q.v.): b. Philadelphia, Pa., 23 April 1809. He was graduated from the University of Pennsylvania in 1801 and until 1900 was engaged in journalism. His publications include: 'J. Devlin, Boss' (1901); 'Stories of the College,' joint author (1902); 'The Captain' (1903); etc.

Williams, Francis Howard, American dramatic writer: b. Philadelphia, Pa., 1844. Among his plays are: 'The Princess Elizabeth: A Lyric Drama' (1880); 'The Higher Education' (1881); 'A Reformer in Ruffles' (1881); 'Master and Man' (1884). He has also written 'Atman: A Story' (1894); 'The Flute Player, and Other Poems' (1894); 'Pennsylvania Poets of the Provincial Period' (1893).

Williams, Sir George, English founder of the Young Men's Christian Association: b. Dulverton, Somerset, 11 Oct. 1821. He began a

WILLIAMS

business career at Bridgewater, became converted in 1837 and was active in attempts to promote the religious welfare of his associates. In 1841 he went to London, gathered together the young men employed in the same establishment as himself, and on 12 June 1844, organized, with others, a society called the "Young Men's Christian Association," which was designed to be "a society for improving the spiritual condition of young men engaged in the drapery and other trades." He was treasurer of the Young Men's Christian Association, 1863-85, and succeeded Lord Shaftesbury as its president in the last named year. He was knighted in 1894. (See *YOUNG MEN'S CHRISTIAN ASSOCIATION*.) Consult Stevenson, 'Historical Records of the Young Men's Christian Association from 1844 to 1884' (1884).

Williams, George Frederick, American politician b. Dedham, Mass., 10 July 1852. He was graduated from Dartmouth in 1872, studied later at Heidelberg and Berlin, was admitted to the bar and has since practised his profession in Boston. He edited Williams' 'Citations of Massachusetts Cases,' and the 'Annual Digest of the United States,' Vols. X. to XVII. He was a member of the State legislature in 1889, sat in Congress 1891-3, and was an unsuccessful Democratic candidate for governor of Massachusetts in 1895, 1896, and 1897.

Williams, George Washington, American author: b. Bedford Springs, Pa., 16 Oct. 1849; d. 1891. He was of African descent, served in the Civil War, subsequently attended school, and was for a time engaged as a preacher and then as a journalist. In 1877 he was graduated from the Cincinnati Law School and in 1879-81 served in the Ohio legislature. He was United States minister to Haiti in 1885-6, and in 1888 was a delegate to the World's Conference of Foreign Missions at London. He was editor of the Cincinnati 'Southwestern Review' and of the Washington 'Commoner,' and published: 'History of the Negro Race in America from 1619 till 1880' (1883); 'History of Negro Troops in the War of the Rebellion' (1887); 'History of the Reconstruction of the Insurgent States' (2 vols., 1889); etc.

Williams, Gershom Mott, American Protestant Episcopal bishop: b. Fort Hamilton, N. Y., 11 Feb. 1857. He studied at Cornell 1875-7, was in mercantile business for several years, and after studying law was admitted to the Michigan bar in 1879. The next year he was ordained to the Episcopal ministry and held rectorships at Detroit, Buffalo, Milwaukee, and Marquette (1880-96). In 1896 he was consecrated bishop of Marquette.

Williams, Helen Maria, English author: b. London 1762; d. Paris 15 Dec. 1827. She was introduced to public notice by Dr. Andrew Kippis, who recommended very highly her first work, a legendary tale in verse, entitled 'Edwin and Eltruda,' which was published in 1782. Between this period and 1788 she published an 'Ode on Peace' (1783); 'Peru, a Poem' (1784); and a collection of miscellaneous poems (1786). In 1790 she settled in Paris, in the same year published a series of 'Letters Written in France,' and in 1792-6 a second series, 'Letters from France,' and in 1795 a third, 'Letters Containing a Sketch of the Politics of France.'

These 'Letters' advocated the doctrines of the Girondists, on whose downfall she was in great danger, and for some time imprisoned. They are one-sided and replete with inaccuracies and misrepresentations. Among her remaining works are: 'A Tour in Switzerland' (1798); 'Narrative of Events in France' (1815); 'Correspondence of Louis XVI.' (1803); 'Letters on the Events Which Have Passed in France since the Restoration in 1815' (1819); an English translation of Humboldt's 'Personal Narrative' (1814); 'Julia,' a novel (1790); and the story, 'Perourou, the Bellows-mender' (1801), on which was based Lord Lytton's 'The Lady of Lyons.' Mention may be made of several well known hymns by her, such as 'My God, all Nature owns Thy Sway,' and 'While Thee I Seek, Protecting Power.'

Williams, Henry Shaler, American geologist and palaeontologist: b. Ithaca, N. Y., 6 March 1847. He was graduated from Yale in 1868, occupied the chair of geology at Cornell in 1879-92, resigning in the last mentioned year to accept a similar chair at Yale, which he still occupies. He was secretary of the International Congress of Geologists at Washington in 1891 and was chairman of the section of geology and geography of the American Association of Advanced Sciences in 1892. He has made extensive studies of the Devonian and Carboniferous systems and has published: 'The Classification of the Upper Devonian' (1885); 'Fossil Faunas of the Upper Devonian' (1884-7); 'The Cuiabod Zone and Its Fauna' (1890); 'Correlation Papers, Devonian and Carboniferous' (1891); 'Shifting of Faunas as a Problem of Stratigraphic Geology' (1903); etc.

Williams, Isaac, English theologian and author: b. near Aberiptwith, Cardiganshire, 12 Dec. 1802; d. Stinchcombe, Gloucestershire, 1 May 1865. He studied at Trinity College, Oxford, in 1831 became fellow there and took priest's orders, and was known as one of the leading Tractarians (q.v.). He was Newman's curate at St. Mary's and was later in charge of the church at Littlemore. With Newman, Froude, and Keble, he contributed to the 'British Magazine' the verse later collected as 'Lyræ Apostolica' (1836); and in the 'Tracts for the Times' he wrote Tract 80, 'Reserve in Communicating Religious Knowledge,' the subject of much discussion. In 1842 he was an unsuccessful candidate for the Oxford chair of poetry, the defeat being regarded as also the first for the Tractarians as a party. From 1842 to 1848 he was curate at Dartington, and afterward resided at Stinchcombe, where he assisted somewhat in the clerical duties of the parish. Among his further publications are several books of poetry, such as 'The Cathedral' (1838; 8th ed. 1859; reprinted 1889 ed. Benham); 'Thoughts in Past Years' (1838; 6th ed. 1852), and 'The Baptistery, or the Ways of Eternal Life' (1842-4; 6th ed. 1863); and some volumes of prose, chiefly sermons. 'Selections' from his writings appeared in 1890; his 'Autobiography' in 1892.

Williams, James Douglas, American politician: b. Pickaway County, Ohio, 16 Jan. 1808; d. Indianapolis, Ind., 20 Nov. 1880. After a common-school education, he became a farmer in Knox County, Ind., first held office in 1838 as justice of the peace for Harrison township in

WILLIAMS

that county, and in 1843 was elected as a Democrat to the House of Representatives in the General Assembly. He sat in the House during seven sessions, and in the Senate for 12. In 1874 he was chosen to Congress, where he served until 1876, resigning upon his nomination as governor of Indiana. He was elected to the office in October, after a vigorous contest, his Republican opponent being Gen. Benjamin Harrison. His administration was one of economy and stability. His chief interest was in connection with the development of the agriculture of Indiana, and he was an incorporator and president of the State Board of Agriculture. He was widely known by his sobriquet of "Blue Jeans."

Williams, Jesse Lynch, American author: b. Sterling, Ill., 17 Aug. 1871. He was graduated from Princeton in 1892 and has since published 'History of Princeton University' with J. De Witt (1898); 'The Stolen Story and Other Newspaper Sketches' (1899); 'The Adventures of a Freshman' (1899); 'New York Sketches' (1902).

Williams, John, English prelate, archbishop of Canterbury: b. Aberconway, Carnarvonshire, Wales, 25 March 1582; d. Glodded 25 March 1650. He was educated at Cambridge, took orders in the English Church in 1609, succeeded Bacon as keeper of the great seal in 1621, an office which he held till 1626, and was consecrated bishop of Lincoln in November 1621. Though a favorite with James I. he incurred the dislike of Charles I., and having supported the Petition of Right in 1628, was prosecuted by Laud before the Star Chamber, charged with betraying the king's secrets. After eight years' legal proceedings he was suspended from his see, fined successively £10,000 and £8,000 and imprisoned in the Tower 1636-40. Released by the Long Parliament and restored to his see, he was made archbishop of Canterbury in 1641, but was again sent to the Tower with 11 other bishops on account of their protest against the validity of acts passed during their enforced absence from the House of Lords. He was released in 1643 and during the Civil War supported the royal cause and fortified and held Conway Castle. Consult: 'Scrinia Reserata,' a Latin life of the prelate, by Hacket and Philips (1700).

Williams, John, American clergyman, known as "the redeemed captive": born Roxbury, Mass., 10 Dec 1644; d. Deerfield, Mass., 12 June 1729. He was graduated from Harvard in 1683, was settled in Deerfield in 1686, and ordained in 1688. On 29 Feb. 1704, a party of 200 French and 142 Indians surprised the town, and some of them, breaking open Williams' house, killed two of his children and his negro servant, and forced him with his wife and six of his surviving children (his son Eleazer was absent) to set out with other prisoners for Canada. On the second day's march Mrs. Williams fell from exhaustion, and was despatched with a tomahawk. About 20 other prisoners were murdered under similar circumstances. On his arrival in Canada, after a journey attended by almost unexampled hardships, Williams was treated by the French with great humanity and even courtesy, and at length was redeemed, and arrived in Boston, 21 Nov. 1706,

with 57 other captives, among whom were two of his children. His daughter Eunice, 10 years of age, was left behind, and married an Indian. Williams, soon after his return, resumed his pastoral charge at Deerfield, and published a narrative of his captivity, entitled 'The Redeemed Captive Returning to Zion' (1707), a narrative of his adventures which furnishes a good picture of the frontier dangers of the time.

Williams, John ("ANTHONY PASQUIN"), English author: b. London 28 April 1761; d. Brooklyn, N. Y., 12 Oct. 1818. He was educated at the Merchant Taylors' School, London, went to Ireland about 1781, edited various periodical publications, and in 1784 was obliged to flee the country to escape prosecution for an attack upon the government. In 1787 he went to France and on his return established the Brighton 'Guide.' He was afterward engaged as a dramatic critic and by his ruthless sarcasm made himself the terror of the theatrical world. In 1797 he sued Robert Faulder, a bookseller, for libel, the latter having denounced him as "lost to every sense of decency," but was nonsuited in his case because of proof that he himself had grossly libeled every respectable character in the kingdom, not sparing even the sovereign. Shortly afterward he came to the United States, where he edited in New York a Democratic newspaper. He died in poverty. His publications include: 'Poems' (1789); 'Legislative Biography' (1795); 'Life of Alexander Hamilton' (1804); 'The Dramatic Censor' (1811); etc.

Williams, John, English missionary: b. Tottenham, Middlesex, 29 June 1796; d. Erromango, New Hebrides, 20 Nov. 1839. At 14 he was apprenticed to an ironmonger, but having offered himself to the London Missionary Society, was sent in 1816 to Eimeo, one of the Society Islands. Later he settled in Raiatea, the largest of the group, and labored here with marvelous success, his powers of organization being as conspicuous as his zeal. In 1823 he went to Raratonga, the chief of the Hervey Islands, where he met with continued success. He next built a boat with his own hands in which during the next four years he visited many of the South Sea Islands, extending his missionary labors to the Samoa Islands. In 1834 he returned to England, there superintending the printing by the Bible Society of his Raratongan New Testament, and raising \$20,000 to equip a missionary ship for Polynesia. In 1838 he went out again, visited many of the stations he had already established, and sailed as far west as the New Hebrides, where he hoped to plant a mission, but was killed and eaten by the savage nations of Erromango. He published 'Narrative of Missionary Enterprises' (1837). Consult the biographies by Cambell (1842) and Prout (1843).

Williams, John, American Protestant Episcopal bishop: b. Deerfield, Mass., 30 Aug. 1817; d. Middletown, Conn., 7 Feb. 1879. He was graduated from Harvard in 1835, studied theology and was ordained deacon in 1838 and priest in 1841. From 1837 to 1840 he was tutor in Washington (now Trinity) College, then was for a time assistant minister of Christ Church, Middletown, Conn., and rector of St. George's, Schenectady, N. Y., 1842-3. In 1848

WILLIAMS

he was elected president of Trinity College and professor of history and literature. He was consecrated assistant bishop of Connecticut in 1851, but retained the presidency of Trinity for two years longer, and then became vice-chancellor. Several students for holy orders having placed themselves under his direction, an informal theological department grew up, which was afterward incorporated as the Berkeley Divinity School at Middletown. Bishop Williams remaining the principal instructor. On the death of Bishop Brownell in 1865, he assumed sole charge of the diocese, whose administration had for a long time been practically in his hands, and at the same time became chancellor of Trinity College. In the General Conventions of 1883 and 1886, he was chosen chairman of the House of Bishops, and in 1887 succeeded Bishop Lee as presiding bishop of the Episcopal Church. His published works include, besides sermons and addresses, 'Thoughts on the Gospel Miracles' (1848) and 'Studies in the Book of Acts' (1888).

Williams, Jonathan, American soldier: b. Boston, Mass., 20 May 1750; d. Philadelphia, Pa., 16 May 1815. He was secretary to his grandfather, Benjamin Franklin, while the latter was ambassador to France, and while abroad read widely concerning fortification and made an especial study of military science. He returned with Franklin in 1785 and was for some years a judge of common pleas at Philadelphia. In 1801 he entered the army, soon becoming inspector of fortifications and taking command of West Point in 1802-3. He resigned in the year last named, but returned to the army in 1805 as chief engineer and superintendent at West Point. While in charge of the fortifications of New York he built Fort Columbus and Castle William on Governor's Island, Castle Clinton (Castle Garden), and Fort Gansevoort. On the breaking out of the War of 1812, as senior officer at Castle William, he claimed command of that fort, and on this being assigned elsewhere, he resigned. He was elected to Congress in 1814, but did not take his seat. As the first person in the United States to apply the principles of scientific engineering he has often been called "the father of the corps of engineers." He published 'The Use of the Thermometer in Navigation' (1799) and translated 'Elements of Fortification' (1801), and 'Kosciusko's Manœuvres for Horse Artillery' (1808).

Williams, Martha McCulloch, American author: b. Montgomery County, Tenn. She was married to T. M. Williams and began writing on removing to New York in 1887. She has published 'Field Farings' (1892); 'Two of a Trade' (1894); 'Next to the Ground' (1901); etc.

Williams, Sir Monier Monier-. See **MONIER-WILLIAMS, SIR MONIER**.

Williams, Oscar Fitzalan, American diplomat: b. Livonia, N. Y., 29 June 1843. He was graduated from Cornell in 1869; engaged in teaching at a business college for 20 years, publishing several commercial textbooks, and was consul to Havre, France, 1880-93. After the Spanish-American War he was active in the adjustment of the Philippine Islands to their new conditions. He was the last United States

consul in Manila, having been appointed in 1897. Since 1901 he has been consul-general at Singapore, Straits Settlements.

Williams, Otho Holland, American soldier: b. Prince George County, Md., March 1749; d. Woodstock, Va., 16 July 1794. He was orphaned at 12 and was placed in the office of the clerk of Frederick County. He entered commercial life in Frederickstown, Md., shortly before the outbreak of the American Revolution, and in 1775 entered the American army with rank as lieutenant. He was promoted major in 1776, and in that year at Fort Washington he was wounded, and taken prisoner. Upon his release he was ordered south with Gen. De Kalb as colonel of a Maryland regiment, and from 1780 until the close of the war served as adjutant-general under Gates and Greene. He played a prominent part in the battles of Camden, Guilford, Hobkirk Hill, and Eutaw Springs, deciding the victory in the last mentioned battle by a brilliant charge. He was promoted brigadier-general in 1782 and from 1783 until his death was collector of customs at Baltimore. His 'Narrative of the Campaign of 1780' was printed in the appendix of Johnson's 'Life of Greene.' Consult Tiffany, 'A Sketch of the Life and Services of Gen. Otho Holland Williams' (1851).

Williams, Roger, the pioneer of religious liberty and founder of Rhode Island: b. Wales 1607; d. Providence, R. I., March 1684. There is considerable doubt as to the year of Williams' birth; authorities differ. Some of them claim he was born in 1601, others in 1603. The writer after a careful examination of all the records, places the date at 1607. Consult Straus' 'Roger Williams, the Pioneer of Religious Liberty,' pp. 5-11.

The most recent investigations have shown that he was the son of James Williams, a merchant tailor of London, and of his wife, Alice Williams. While yet a mere boy, he attracted the attention of Sir Edward Coke, while taking shorthand notes of sermons and speeches in the Star Chamber, and Coke placed him (1621) in the Charter House School. From there (1623) he went to Pembroke College, Cambridge University, from which he took his degree in 1626. Williams soon developed into a decided opponent of the liturgy and ceremonies of the church, thereby placing himself on the side of the most radical Puritans. On 1 Dec. 1630 he embarked from Bristol with his young wife in the ship *Lyon*, and arrived at Nantasket 5 Feb. 1631. No sooner had he set foot upon the shores of New England than he came in conflict with the ecclesiastical and civil authorities of the colony, whom he found arrayed against him, for asserting and maintaining with unwavering fidelity those principles which have immortalized his name as the champion of religious liberty.

The arrival of Williams in America was noted by Winthrop as that of a "Godly minister." He was already known and esteemed by the leading men in the colony, and he was immediately invited to officiate in the place of John Wilson as teacher of the church at Boston, which, however, Williams declined on the ground that they of Boston were an unseparated people. It is well to note here a distinction between the Pilgrims and the Puritans.

WILLIAMS

The former were Separatists, and were associated as a distinct church before they left Holland. A principle of their church was, that the State had no right to punish for spiritual sins. The Puritans, on the other hand, though Non-conformists, were not separated from the established church. Their scruples were against conforming to many of the ceremonies of that church. He was invited by the Pilgrim Church at Salem to become an assistant or teacher in place of Higginson, who died a few months before. This call Williams accepted, but the civil authorities, the General Court of Boston, interfered and remonstrated with the Salem church for choosing him. He remained at Salem only a short while, and in August removed to Plymouth, where he was received with much respect. Here he remained for two years, supporting himself by manual labor and officiating as "teacher" in the church among the Pilgrim fathers. During his residence here he became intimately acquainted with various Indian chieftains in the neighborhood, which intimacy had an important bearing in his subsequent life in the founding of Rhode Island.

In August 1633 he returned to Salem and resumed his ministerial labors there, but at every turn he found himself in conflict with the clergy and the court of Massachusetts. He was frequently cited to appear before the court. In October 1635 he was tried before the General Court, consisting of the governor, the deputy governor, 8 assistants, and some 25 deputies. The formal charges against him were four in number, but the basis of them may be summed up by the statement that he maintained that the civil power has no jurisdiction over the conscience, or, in other words, he maintained the absolute liberty of conscience. The court convicted him and sentenced him to banishment. In January 1636 he left Salem to escape arrest, and to seek a refuge from the tyranny of the church brethren. He went first to Seekonk, and afterward with four companions who joined him, embarked in a canoe to seek a spot beyond the jurisdiction of the Massachusetts and Plymouth colonies. The site selected by him was Providence, so named by him in gratitude for "God's merciful providence to him in his distress."

In March 1683 a large section of land was conveyed to him by deed from the Indians, which land he divided equally among his followers. Mrs. Williams and her two infant children joined him, and friends from Massachusetts and England soon joined the Rhode Island Colony.

William Coddington, who had been a merchant in Boston, was elected as magistrate with the title of judge, and three elders were elected to assist him. This form of government continued until 1640. Meanwhile the antagonism of the Boston Colony to Williams continued, and a law was passed which practically excluded the inhabitants of Providence from entering Massachusetts. In March 1641 the government of Rhode Island was regularly organized.

The formation of the New England Confederacy, in 1643, which included the four colonies, Massachusetts, Connecticut, Plymouth and New Haven, was a matter of anxious concern to the Rhode Island and Providence settlements. The open hostility of the Confederacy, together with

the claim made by Massachusetts that the Rhode Island and Providence colonies had no authority to set up civil government, induced these latter colonies to seek a charter from England. At an assembly held in Newport 19 Sept. 1642, a committee was appointed to procure a charter, and in July 1643 Williams set sail from New York for England. Here on 17 March 1644 he obtained a charter which gave to the towns of Providence, Portsmouth and Newport, full power to rule themselves under the name "The Providence Plantations of Narragansett Bay." This charter granted in the most friendly spirit everything that Williams prayed for.

Williams returned to America in 1644, landing in Boston 17 September. He ventured to tread on this forbidden ground by exhibiting a letter from 12 leading members of the Parliamentary party in England, addressed to the government of Massachusetts. He therefore proceeded without hindrance to Providence. In May 1647 a form of government was agreed upon, after many delays, the office of president of the colony, which so naturally belonged to Williams, was bestowed upon John Coggeshall of Newport. Dissensions arose within and without the new colony; Williams was called upon to pacify the Indians and to settle numerous disputes ecclesiastical and civil. In October 1652 Williams was again in England making efforts to secure a renewal of the colony's charter; this he secured and returned to America, landing in Boston in 1654. In this same year the reorganization of the Rhode Island government took place, and on 12 September Williams was elected president of the colony. He was again elected 20 May 1656. In this year the persecution of the Quakers in Boston soon made Rhode Island a Quaker refuge, and they were made welcome largely through the influence of Roger Williams. For many years, until 1677, Williams continued to hold various offices and to guide the affairs of the colony. In the Indian wars of 1675-6 (see KING PHILIP'S WAR), when Providence was attacked, Williams was captain of militia and drilled companies in Providence. See RHODE ISLAND.

The life of Roger Williams was now rapidly nearing its end. His Providence friends did not fully appreciate the life-work of this sturdy champion of soul liberty, which was destined to bring happiness to a continent. At his death the brief record was conveyed to the outer world in a letter dated 10 May 1684, stating, "The Lord hath arrested by death our ancient and approved friend, Mr. Roger Williams, with divers others here." He was buried in a spot which he himself had selected on his own land, near where, 47 years before, he had first landed within the colony he founded.

The principles of religious liberty had been proclaimed in all ages, and under many climes, with more or less plenitude, but Roger Williams was the first to organize and build up a political community with absolute religious liberty as its chief cornerstone. To him the successful pioneer of these principles is due to a larger extent than to any man, the American system of a "free church in a free State."

No portrait of him in bronze or in marble, or of any kind, has come down to us, and when in 1872 the State of Rhode Island presented a statue of her founder to the nation, which now

WILLIAMS—WILLIAMS COLLEGE

stands in the rotunda of the Capitol at Washington, the artist had to make the memorial from an ideal conception.

Among the great men of his times with whom Williams stood in close personal relations, besides his early patron, Sir Edward Coke, were Cromwell, John Milton, Sir Henry Vane, the younger, Major-General Harrison of the Parliamentary army; Lawrence Lord, president of the Council of State, and others of distinction in England and America. See UNITED STATES—CIVIL AND RELIGIOUS LIBERTY.

OSCAR S. STRAUS,

Author of 'Roger Williams, the Pioneer of Religious Liberty.'

Williams, Rowland, Anglican clergyman and educator: b. Halkyn, Wales, 16 Aug. 1817; d. Broad Chalk, near Salisbury, Wiltshire, 18 Jan. 1870. He was graduated from King's College, Cambridge, in 1841 and was fellow and tutor there in 1839–50. He accepted the chair of Hebrew at the theological college of Saint David's in 1850, acting also as vice-president of that institution. In 1854 he became select preacher at Cambridge and became vicar of Broad Chalk in 1858, while still retaining his offices at the college. His views on inspiration brought him into disfavor with the Welsh clergy and in 1862 he was prosecuted and condemned for heresy in the Court of Arches. He resigned his professorship and retired to his vicarage at Broad Chalk, where he henceforth lived, though in 1864 he secured from the Privy Council a reversal of the judgment against him. His publications include: 'Rational Godliness' (1855); 'The Hebrew Prophets' (1868–71); 'Psalms and Litanies' (1872); etc. Consult Ellen Williams' 'Life and Letters of Rowland Williams' (1872).

Williams, Samuel Wells, American missionary and philologist: b. Utica, N. Y., 22 Sept. 1812; d. New Haven, Conn., 17 Feb. 1884. He was graduated from the Rensselaer Institute, Troy, N. Y., in 1832, and in 1833 went to Canton, China, as printer to the American Mission. He was compelled to remove to Macao in 1835, and in 1845–8 was in the United States, after which he resumed his work in Canton. He acted as interpreter to Commodore Perry on his Japanese mission in 1853–4, and in 1857 resigned his position in the mission and became secretary and interpreter to the United States legation. He assisted in the negotiation and ratification of the treaty of Tientsin in 1858–9. Upon the establishment of the United States legation at Peking under Burlingame in 1862 he became its secretary, occupying the post until 1876, when he returned to the United States and accepted the chair of Chinese at Yale, where he remained until his death. He was editor and contributor to the 'Chinese Repository' during the time of its publication (1832–51), and was a leading authority on the Chinese and Japanese languages. He superintended the press work of Medhurst's 'Dictionary of the Hokkien Dialect' (1837) and with Bridgman issued 'Chinese Christomathy' (1841). His other works include: 'Easy Lessons in Chinese' (1842); 'The Topography of China' (1844); 'The Middle Kingdom' (1848); 'A Syllabic Dictionary of the Chinese Language' (1874); etc. The two last mentioned are the greatest of his works and are still among the

highest authorities in their field. Consult F. W. Williams, 'Life and Letters of Samuel Wells Williams' (1888).

Williams, William, American patriot and signer of the Declaration of Independence: b. Lebanon, Windham County, Conn., 8 April 1731; d. there 2 Aug. 1811. He was graduated at Harvard College in 1751, in 1755 served on the staff of Col. Ephraim Williams in the Lake George expedition, and after the revolutionary troubles began was an active member of the council of safety, and in October 1775 was chosen a representative in the Continental Congress. His property was nearly all expended in the war, and he was tireless in obtaining private donations to supply the army, going from house to house to collect articles that could relieve the destitution of the soldiery. He held nearly every office in the gift of his constituents, served nearly 50 years in the State legislature, and was a member of the convention of his State which adopted the Federal constitution.

Williams, Sir William Fenwick, British soldier: b. Annapolis Royal, Nova Scotia, 4 Dec. 1800; d. London 28 July 1883. He was graduated at Woolwich in 1821, entered the Royal Artillery in 1825, and after serving in the East Indies several years was appointed British commissioner to the conference in Erzerum, to settle the boundary dispute between Persia and Turkey in Asia. During the Crimean war he was sent as commissioner to the relief of Kars, and there promptly reorganized the troops. After defending Kars for four months against the Russians he met their commander, Gen. Mauravieff, on the heights above the city and defeated him with great slaughter. Assisted by the Hungarian Gen. Kmety, he did all in his power for the defense of Kars, but on 14 Nov. 1855 was forced by famine to capitulate. On his return to England he was created baronet, received the rank of pasha of the highest order and the decoration of the Medjidieh from the sultan; and was made a grand officer of the Legion of Honor of France. He sat in Parliament for Calne 1856–9 and then assumed the command of the forces of British North America. He was administrator of Canada in 1860–1; became full general in 1868; was governor-general of Gibraltar 1870–5; and retired from the army in 1877.

Williams College, located at Williams-town, Mass. It owes its origin to the bequest of Col. Ephraim Williams, for establishing a "Free School" in Williamstown. The bequest was made in 1755; the property was sold, and the funds were allowed to accumulate till 1785, when a free school was incorporated by the legislature, and a lottery granted for raising funds to erect a building; in 1790 the building (now the West College) was completed, and the school was opened 20 Oct. 1791. In 1793 the institution was incorporated as a college under its present name, the property vested in the free school was transferred to the college, and a grant of \$4,000 was made by the State to purchase a library and apparatus. The college subsequently received other appropriations from the State; in 1796 the legislature granted two townships of land; in 1809 an additional township; and in 1814 appropriated the taxes from the Massachusetts Bank for 10 years to Harvard, Williams, and Bowdoin, Williams'

WILLIAMSBURG

share in which amounted to \$30,000; in 1859 the legislature appropriated \$25,000, and in 1868, \$75,000. In 1806 the first foreign missionary society in the United States was formed at Williams. In 1836-72 Mark Hopkins (q.v.) was president of the college, and during his administration it attained a high degree of prosperity.

The college course is arranged on the group system, there being three groups of studies, language, philosophy (including history and political economy), and sciences. The work of the freshman year is largely required; after the first year all work is elective, but students must elect a major course (15 semester hours), and a certain amount of work in each group. The degree of A.B. is conferred, and A.M. for graduate work and thesis. There are 76 general scholarships, and one special prize scholarship. The principal college buildings are West College, the oldest, erected 1790; East College, erected in 1798, burned in 1841, and rebuilt; South College; Griffin Hall; Hopkins Observatory, built in 1837, under the direction of Prof. Albert Hopkins, the first college observatory in the United States; Lawrence Hall Library; Jackson Hall; Alumni Hall Chapel; College Hall; Clark Hall; Field Memorial Observatory, erected 1882, containing a fine meridian circle by A. Repsold and Sons, Hamburg; Morgan Hall; Lasell Gymnasium; Hopkins Memorial Hall; Thompson Chemical Laboratory; Thompson Biological Laboratory; Thompson Physical Laboratory; College Infirmary; and Jesup Hall. The library in 1904 contained 50,500 volumes; in addition the two literary societies have libraries containing 9,000 volumes. The endowment in 1904 amounted to \$1,469,671; the students numbered 442 and the faculty 35; the total number of graduates was 4,087.

Williamsburg, wil'yamz-bérg, Ky., town, county-seat of Whitley County; on the Cumberland River, and on the Louisville & Nashville Railroad; about 95 miles south by east of Lexington. It is in an agricultural and coal-mining region. It has flour and lumber mills and large coal yards. It has one bank which has a capital of \$60,000. Pop. (1890) 1,370; (1900) 1,495.

Williamsburg, Va., city, county-seat of James City County; on the Chesapeake & Ohio Railroad; about 48 miles southeast of Richmond. It is the oldest incorporated town in the State. It was established in 1632, and prior to the Revolution it was the capital of the province. It was also the State capital until 1779. It has many historic associations connected with the pre-Revolutionary days and the Civil War. It is the seat of William and Mary College (q.v.), and it has the Eastern Lunatic Asylum, opened in 1773, the oldest institution of its kind in the United States. On 3 May 1862 it was occupied by the Confederate forces, who had withdrawn from Yorktown, and three days later an attack was made by the Union forces. The battle lasted all day. (See **WILLIAMSBURG, BATTLE OF**.) Pop. (1890) 1,068; (1900) 1,060.

Williamsburg (Va.), Battle of. Gen. J. E. Johnston abandoned Yorktown (q.v.) on the night of 3 May 1862, and at noon next day had assembled his army at Williamsburg, whence his head of column (Magruder's division) was

ordered to continue the march toward Richmond. Longstreet's and McLaws' divisions remained until the trains could be got on the road, and to cover the retreat. McClellan was surprised to find Yorktown evacuated, had made no provision for such a contingency, and it was noon of the 4th before the pursuit began, when Gen. Stoneman's cavalry and four batteries of horse artillery, followed by Hooker's division of infantry on the direct road from Yorktown to Williamsburg, and Smith's division from Lee's Mills, were on the roads to harass the Confederate rear and cut off those who had marched from Lee's Mills and by that road. Stoneman overtook Stuart's Confederate cavalry about midway between Yorktown and Williamsburg, driving it steadily back to the works in front of Williamsburg, where he was checked by Stuart and by McLaws with two brigades of infantry, and began to withdraw when McLaws attacked him with two regiments and he was obliged to abandon one of his guns stuck in the mud. Gen. Emory, who had been sent to the left with a regiment of cavalry and a battery, to intercept such of the Confederates as were retreating on that road, encountered Stuart himself, with a regiment and a battery, Stuart falling back, skirmishing, until dark. Hooker, who was expected to support Stoneman, found himself cut off by Smith's division, which, moving from Lee's Mills, had been ordered by Sumner to cross over from its proper road and take the one on which Hooker had been ordered by McClellan. Smith reaching it at the Half-Way House before Hooker came up, the latter was obliged to wait several hours until Smith could pass. Smith overtook Stoneman about 5.30 p.m., relieved him, and forming line prepared for a charge through a body of woods and beyond to the Confederate works, but it was approaching night when the formation was completed and the movement began; the woods were found to be dense, with tangled undergrowth; and the movement was abandoned as impracticable, and the troops went into bivouac. Hooker crossed over to the road Smith was to have taken, marched until midnight, and lay down in rain and mud, some distance on Smith's left, but the same distance from the Confederate works. The divisions of Kearny, Couch, and Casey were ordered to follow Hooker and Smith; McClellan remained at Yorktown to supervise the embarkation of Franklin's division, which was to go up York River; and Sumner, at noon of the 4th, was directed to take command of the troops ordered in pursuit. Hooker, acting on the strength of the orders he had received personally from McClellan before marching from Yorktown, opened the battle very early in the morning by advancing on Fort Magruder, which was in his immediate front, and flanked right and left nearly across the peninsula by 12 smaller redoubts, all having cleared ground in front dotted with rifle-pits. The roads were muddy, axle-deep; Grover's brigade began the attack at 7 a.m. by driving in the Confederate skirmishers; and two batteries were pushed to within 700 yards of Fort Magruder, and with the aid of Grover's skirmishers silenced its fire by 9 o'clock. But the contest had not fairly begun. McLaws, who held the Confederate position on the evening of the 4th, had followed the train during the night, and Longstreet was left in command, who placed the

WILLIAMSBURG BRIDGE

brigades of R. H. Anderson and Pryor with some field guns in the works that had been held by McLaws. Anderson on the right and Pryor on the left were thrown against Hooker, followed in quick succession by Willcox, who reinforced Anderson, and by A. P. Hill, and about 10 A.M. Pickett's brigade was brought up. These five brigades attacked Hooker's three brigades with great impetuosity, making a desperate effort to turn the left, held by Patterson's New Jersey brigade. Grover moved a part of his brigade to Patterson's support, and Taylor's brigade was sent in; but the odds were too great, and by 11 o'clock Hooker's line was pushed back, uncovering the two batteries, both of which were abandoned, one being retaken. Hooker called for reinforcements, but it was not until 3 P.M. that Kearny's division came to his relief. Kearny made a vigorous attack, and by nightfall had regained a part of the field from which Hooker had been driven. Hooker's loss was about 1,600. Hooker says in his report: "History will not be believed when it is told that the noble officers and men of my division were permitted to carry on this unequal struggle from morning until night unaided in the presence of more than 30,000 of their comrades with arms in their hands; nevertheless it is true." Gen. Webb, the historian of the Peninsula campaign, says: "From 7 A.M. till noon Hooker, alone on the left, had been doing all the fighting. No troops fell into line of battle on his right. No other line was engaged anywhere during the forenoon." Sumner, on Hooker's right, had been employed in reconnoitering, with the intention to turn the Confederate left, and near noon Gen. Hancock, with five regiments and a battery, was sent to seize a redoubt, apparently unoccupied, on the Confederate left, one of four redoubts northward of Fort Magruder. By midday he had seized it and, pushing forward, occupied a second empty redoubt and sent back for reinforcements, as he was now confronted by the enemy, who held the two redoubts between him and Fort Magruder. Twice Sumner ordered two brigades to reinforce, and twice he countermanded the order, finally sending him orders to return, but he had sent him some artillery. Meanwhile D. H. Hill's division had been recalled from its march in retreat and ordered to the left of the Confederate line, and Gen. Early, first to arrive with his brigade, obtained permission of Gen. Johnston, who also had returned to the field, to attack one of the batteries, which was annoying the Confederate troops near Fort Magruder. It was after 5 P.M. when D. H. Hill and Early, with two regiments each, pushed forward through dense undergrowth to an open field, early in advance, and when they came within easy range Hancock, who was falling back, following his artillery, turned upon Early, poured in two effective volleys, and charged, driving Early back upon Hill, and both from the field, inflicting a loss of nearly 400 men, among them Gen. Early, who was severely wounded. Hancock's loss was 31. Late in the afternoon McClellan came up and ordered troops to Hancock's assistance, but Hancock had repulsed Early before they reached him. McClellan made dispositions to renew the battle in the morning, but during the night Johnston evacuated Williamsburg, leaving D. H. Hill to bring up the rear. The Union troops engaged numbered about 20,000 men; the Con-

federates, about 15,000. The Union loss, mostly in Hooker's division, was 456 killed, 1,410 wounded, and 373 missing or captured. Incomplete Confederate returns show a loss of 102 killed, 1,458 wounded, and 133 captured or missing. Consult: 'Official Records,' Vol. XI.; Webb, 'The Peninsula'; 'McClellan's Own Story'; Allan, 'History of the Army of Northern Virginia'; The Century Company's 'Battles and Leaders of the Civil War,' Vol. II.; Johnston, 'Narrative of Military Operations.'

E. A. CARMAN.

Williamsburg Bridge, an immense structure in New York which is the largest span suspension bridge of its kind in the world. Work on the structure was begun in October 1896. The bridge spans the East River from Delancey Street, Manhattan, to South Fifth and South Sixth streets, Brooklyn. Its total length from the street grade in Manhattan to the street grade in Brooklyn is 7,200 feet. The width of the bridge is 118 feet. In carrying capacity it exceeds any other bridge in the world. It provides for two 18-foot roadways, two footpaths, four street railway tracks, two elevated railway tracks, and two bicycle paths. The length of the main span is 1,600 feet, or exactly five feet six inches more than that of the Brooklyn Bridge (q.v.). The bridge is 7,204 feet long, or about 1,275 feet more than the Brooklyn Bridge. The foundations of the new structure consist of timber caissons filled with concrete. The anchorages are massive structures. The one on the Manhattan side rests on 3,500 piles, while the one on the Brooklyn side is built on natural sand. The weight of the steel in each of the towers is 3,048 tons. The steel in the Brooklyn approach weighs 6,085 tons, while that in the Manhattan approach weighs 10,550 tons. The main span weighs 7,772 tons, while the cables and fittings weigh 5,000 tons. The diameter of the suspension cables, outside of the wires, is 18¾ inches. There are 7,696 wires in each cable. Each wire is about 3-16 of an inch in diameter. The timber used in the construction of the bridge amounted to 6,500,000 feet. The excavating equaled 125,000 cubic yards. Of concrete masonry there are 60,000 cubic yards, and of stone masonry 130,000 cubic yards. The steel used amounted to 40,000 tons. The foundations for the towers of the bridge rest on the solid rock. The north pier on the Manhattan side is 56 feet deep at high water, while the south pier is 10 feet deeper. On the Brooklyn side the north pier is 110 feet below high water, while the south pier is only 90 feet deep. The first wire for the construction of the temporary footbridge was strung on 11 April 1901, and the first wire for the permanent cable crossed on Friday, 29 Nov. 1901. The bridge was opened to the public 19 Dec. 1903. Following are figures comparing the Williamsburg Bridge with the Brooklyn Bridge as regards their cost, length, capacity, and details of construction:

BROOKLYN BRIDGE.

Total cost	\$14,750,000
Total length	5,989 feet
Length of span over river.....	1,595 feet
Height from high water to top of towers...	278 feet
Height of centre of bridge structure from East River	135 feet
Weight of suspended structure between towers	6,620 tons
Daily passenger capacity, each way.....	780,000

APPROACH TO THE WILLIAMSBURG BRIDGE.

Total width 118 feet, including four street railway tracks, two elevated railway tracks, two eighteen-foot roadways, and two foot-passenger and bicycle paths.

WILLIAMSON — WILLIAMSTOWN

Extreme width	85 feet
One deck, net width	73 feet
Number of wires in each cable	5,296
Total miles of wire in four cables	14,361
Diameter of cables	15½ inches
Ultimate strength of each cable, in tons	12,200
One promenade, two trolley tracks.	
Two roadways, two railway tracks.	

WILLIAMSBURG BRIDGE.

Total cost	\$20,000,000
Total length	7,264 feet 2 inches
Length of span over river	1,600 feet
Height from high water to top of towers	333 feet
Height of centre of bridge structure from East River	135 feet
Weight of suspended structure between towers	7,771 tons
Daily passenger capacity, each way	2,000,000
Extreme width	118 feet
Two decks, net width (both)	137 feet
Number of wires in each cable	7,700
Total miles of wire in four cables	17,432
Diameter of cables	18½ inches
Ultimate strength of each cable, in tons	24,500
Two promenades, four trolley tracks, two bicycle paths.	
Two roadways, two railway tracks.	

Williamson, wī'lam-sōn, **Alexander William**, English chemist and educator: b. Wandsworth, Surrey, 1 May 1824. He was educated at Paris, Heidelberg, and Giessen, in 1849 was appointed professor of practical chemistry at University College, London, and in 1875 he accepted the chair of chemistry also, occupying both chairs until 1887 when he resigned and was appointed professor emeritus. He has made important researches on etherification, gas analysis, the atomic theory, etc., and has written several important papers concerning his investigations, including 'Etherification and the Constitution of Salts,' which attracted widespread notice. He also published 'Chemistry for Students.' He is a member of different English and foreign scientific societies, and has been president of the Chemical Society and of the British Association.

Williamson, Francis John, English sculptor: b. Hampstead, England, 17 July 1833. He was a pupil of J. H. Foley and later became his assistant, afterward settling at Esher, Surrey, where he has since lived. He has executed many ideal and private commissions, including portraits of the royal family at the order of Queen Victoria. Among his works are statues of Queen Victoria in Australia, India, Ireland, London, etc.; Dean Milman in Saint Paul's Cathedral; and numerous public statues in different parts of the British Isles.

Williamsport, wī'lamz-pōrt, Ind., city, county-seat of Warren County; on the Wabash River and the Wabash Railroad; 71 miles northwest of Indianapolis. It was founded in 1827. It is the trade centre of an agricultural region, and is also situated within three miles of large coal mines; it has a building-stone quarry, grist-mills and warehouses; and two state banks with a combined capital of \$100,000. There is a high school founded in 1884. Pop. (1890) 1,027; (1900) 1,245.

Williamsport, Md., town in Washington County; on the Potomac River, the Chesapeake & Ohio Canal, and the Cumberland Valley and West Maryland R.R.'s; 65 miles northwest of Washington. It was founded in 1787; in 1863 Lee's army crossed the Potomac at this point on the march to Gettysburg. It is situated in an agricultural and timber region, and carries on a considerable trade. It has flour and lum-

ber mills and sash and door factories; and a national bank with a capital of \$100,000. There is a high school, and several elementary schools, including one for colored pupils. Pop. (1890) 1,277; (1900) 1,472.

Williamsport, Pa., city, county-seat of Lycoming County; on the West Branch of the Susquehanna River, and on the Pennsylvania, the Northern Central, and the Philadelphia & R. R.R.'s; about 95 miles north of Harrisburg. It is on the Alleghany plateau, in an agricultural and mining region. The chief manufacturing establishments are steel works, lumber mills, furniture and rubber goods factories, wood-working machinery works, wire rope, nail, and engine factories, boot and shoe factories, silk mills, sewing-machine factory, and fire escape works. In 1900 (government census) Williamsport had 396 manufacturing establishments, capitalized for \$9,863,811 and employing 5,595 persons, to whom were paid annually \$2,065,930. The total cost of raw material each year was \$6,420,337, and the value of the finished product \$11,109,600. The lumber and timber products for 1900 were valued at \$1,429,028; the leather products, \$839,375; and the foundry and machine shop products, \$747,617. The city has an extensive trade in lumber products and coal.

The principal public buildings are the government building, city-hall, opera house, city hospital, home for the Friendless, and Masonic Temple. The city has two parks, Brandon and Vallamont; and Sylvan Dell and Starr Island are near by. There are over 50 churches, with 14,000 communicants. The educational institutions are Dickinson Seminary (M. E.), a high school, opened in 1869, 14 public schools, two large Roman Catholic parish schools, and two commercial colleges. The seven banks have a combined capital of \$1,225,300. The government is vested in a mayor, who holds office three years, and a council of 39 members. The board of education is chosen by popular vote.

Williamsport was settled in 1779, and set off as a town in 1795. In 1806 it was incorporated as a borough, and in 1866 was chartered as a city. The city grew slowly until 1850, when the lumber industry began. Since then the growth has been rapid and the manufacturing and commercial industries have kept pace with the population. Pop. (1850) 1,615; (1880) 18,934; (1890) 27,132; (1900) 28,757; (1903, est., Gov. Report) 29,246. JOHN R. BIXLER,

Managing Editor, 'The Williamsport Sun.'

Williamstown, Australia, a seaport in Victoria, on the southwest shore of Hobson's Bay, immediately opposite Port Melbourne, and 9¼ miles southwest of Melbourne. The business interests of the town largely centre in the shipping. The piers are commodious, and there are shipbuilding yards, patent slips, and a dry-dock called the Alfred Graving Dock, opened in 1874 and improved in 1897-8. The chief buildings are the churches, the mechanics' institute, the custom-house, the sailors' rest banks and similar buildings, etc. Basalt and brown coal are worked near the town, and several manufactures are carried on. Pop. (1901) 14,083.

Williamstown, Mass., town in Berkshire County; on the Hoosac and Green rivers, and on the Fitchburg (Boston & Maine) Railroad;

WILLIMANTIC—WILLOUGHBY

about five miles west of North Adams and 40 miles east of Troy, N. Y. It was settled in 1753 and was named West Hoosic. In 1765 it was incorporated and the name was changed to Williamstown in honor of Ephraim Williams. In 1793 Williams College (q.v.) was opened, since when it has been a favorite residential town. There are five villages within the town limits. The chief industrial establishments are a cotton mill, a large bleachery, and large freight yards. Market gardening is carried on to quite an extent. There are two banks, one national and one state. Pop. (1890) 4,221; (1900) 5,013.

Willimantic, wil-i-măn'tik, Conn., city in Windham County; at the confluence of the Willimantic and Natchaug rivers, and on the Central Vermont and the New York, N. H. & H. R.R.'s; about 35 miles east by south of Hartford. It has the water power from the Willimantic River, which here has a fall of 91 feet within the city limits. The chief manufacturing establishments are cotton warp mills, print factories, thread and silk mills, foundry, machine shops, spool factory, and silk machinery works. The educational institutions are a State normal school, a high school, public graded schools, a large parish school, a public library containing about 6,000 volumes, and the Dunham Hall Library. There are two banks, the national bank has a capital of \$100,000 and the combined deposits (1903) amount to \$850,170. It was incorporated as a borough in 1833, and in 1893 was chartered as a city. Pop. (1890) 8,648; (1900) 8,937.

Willis, wil'is, **Nathaniel Parker**, American author: b. Portland, Me., 20 Jan. 1806; d. Idlewild, N. Y., 20 Jan. 1807. He was graduated from Yale in 1827, and was employed by S. G. Goodrich ("Peter Parley") to edit two annuals, the 'Legendary' in 1828, and the 'Token' in 1829. In 1828 he established at Boston the 'American Monthly Magazine,' which, after he had conducted it for two and a half years, was merged in the New York 'Mirror.' He now set out on a tour of travel through Europe, visiting France, Italy, Greece, European Turkey, Asia Minor, and finally England, with the rank of an attaché to the American embassy at Paris, but chiefly as a correspondent of the 'Mirror,' for which he wrote his 'Pencilings by the Way,' later (1835) published in book-form. He returned in 1836, became in 1839 editor of the 'Corsair,' a New York periodical (1839-40), and in the same year again went to England. He returned to New York in 1846, and subsequently directed two short-lived papers, 'The New Mirror' (1843-4) and 'The Evening Mirror' (1844-5). Once more in Europe in 1845-6, he became in the last named year editor of 'The Home Journal,' the most successful of all his journalistic ventures, in the management of which he was associated with George P. Morris (q.v.). Willis was from the first a facile versifier, and a prose-writer of great reportorial cleverness. His scriptural poems were in their day very popular, and many are still readable; and his other verse, when nothing else, was metrically able. Sometimes it reached real poetic value, and effective specimens of it have been preserved by the anthologist. His fiction, except the 'Slingsby' papers, written for the English 'New Monthly,'

is generally without interest, save for its extravagance. 'Pencilings by the Way' (1835) abounds in talented sketches of contemporaries. Willis was the most successful American journalist of his time, and his vogue was great. Among his principal works are: 'Pencilings by the Way' (1835); 'Inklings of Adventure' (1836); two dramas entitled 'Two Ways of Dying for a Husband' (1839); 'Loiterings of Travel' (1840); 'Dashes at Life with a Free Pencil' (1845); 'People I Have Met, or Pictures of Society and People of Mark, Drawn Under a Thin Veil of Fiction' (1850); 'Hurry-graphs' (1851); a 'Health Trip to the Tropics' (1853); 'Outdoors at Idlewild' (1854); 'The Rag-bag,' a collection of ephemera (1855); 'The Convalescent, His Rambles and Adventures.' Consult the 'Life' by Beers ('American Men of Letters,' 1885). There is an estimate of Willis in Lowell's 'Fable for Critics.'

Willis's Rooms. See ALMACK'S.

Willmar, wil'mar, Minn., village, county-seat of Kandiyohi County; on Foot Lake and on two branches of the Great Northern Railroad; about 95 miles west by north of Minneapolis. The village was founded in 1868. It is in an agricultural and stock-raising region and has a large trade in grain, hay, dairy products, and live stock. It has nine churches, a high school and graded schools. The three banks, one national and two state, have a combined capital of \$40,000 and deposits (1903) amounting to \$873,070. Pop. (1890) 1,825; (1900) 3,409.

Willopah, an Athapascan tribe of North American Indians who formerly occupied the territory drained by the upper waters of Chehalis River and its tributaries in southwestern Washington. They ceded their lands to the United States in 1864, when but few of them remained.

Willoughby, wil'ô-bî, **Sir Hugh**, English Arctic explorer: b. probably Risby, Derbyshire, about 1500; d. about 1554. In 1553 he was appointed to command an expedition fitted out by London merchants "for the discovery of regions, dominions, islands, and places unknown," and on 10 May sailed from Deptford with three vessels, the Bona Esperanza, his own ship, with 35 persons; the Edward Bonaventure, carrying 50 men; and the Bona Confidentia, with 28 men. They sighted the coast of Norway about the middle of July and during a storm in the middle of September the Edward Bonaventure, at Senjen, parted company with the two other vessels, which reached Russian Lapland, where they found a good harbor at the mouth of the river Arzina. Here Willoughby and his 62 companions perished during the course of the winter. The following year Russian fishermen found the ships with the dead bodies of the crews, together with commander's journal, and a will witnessed by Willoughby, showing that some of the mariners were alive in January 1554. Chancellor, after being separated from his comrades, finally reached Archangel, near the mouth of the river Dwina, in the White Sea. News of his arrival was immediately despatched to the Czar Ivan Vasilievitch, who invited the mariners to the court of Moscow. A direct trade with Russia resulted from Chancellor's discovery.

WILLOUGHBY — WILLOW

Willoughby, Westel Woodbury, American publicist: b. Alexandria, Va., 20 July 1867. He was graduated from Johns Hopkins University in 1888 and for several years practised law in the District of Columbia. He has published: 'The Supreme Court of the United States: its History and Administrative Importance' (1890); 'Government and Administration of the United States' (1891); 'The Nature of the State' (1896); 'Rights and Duties of American Citizenship' (1898); 'Social Justice' (1900).

Willoughby, William Franklin, American economist, twin brother of Westel Willoughby (q.v.): b. Alexandria, Va., 20 July 1867. He was graduated at Johns Hopkins University in 1888; was expert in the United States Department of Labor 1890-1900; and in 1900 was made special agent on education and social economy of the United States Commission to the Paris Exposition. He has several times represented the Department of Labor at international congresses for the investigation of labor conditions in Europe; is a member of the American Economic Society, a fellow of the Royal and American Statistical societies, and a lecturer on economics at Johns Hopkins. He published 'Workingman's Insurance' (1898).

Willow, a genus of trees and shrubs (*Salix*) of the order *Salicaceae*. The species, of which more than 150 have been described, are natives mostly of the North Temperate zone, but a few are indigenous in the tropics and in the South Temperate zone, and some are found close to the limit of perpetual snow in the Arctic zone and upon lofty mountains, where they are reduced very greatly in stature, etc. One of these last, a European species (*S. herbacea*), rarely exceeds an inch in height. Willows are characterized by simple, usually lanceolate leaves, which in the bud are surrounded by a single bud-scale, flowers naked dioecious, in catkins, followed by dehiscent fruits containing little appendaged seeds which usually float readily with the breeze. In general, the species are best adapted to wet ground, along streams, etc., and on this account are frequently planted to dry out damp ground and for improving the sanitary conditions around cess-pools. Like the Australian gum-trees (*Eucalyptus*, q.v.), which are similarly used, they transpire immense quantities of water. Some of the species are of importance along streams and lakes where they prevent the washing of the soil either by current or wave. In pleasure grounds, summer resorts, etc., they are often planted because they will thrive almost anywhere and also because they quickly produce an effect. In such capacity, however, they should be used more as temporary than as permanent trees and should be replaced by better, sturdier trees, such as maples, elms, beeches, and others of slower growth. Some of the species or their varieties produce pleasing effects during winter because of their yellow or red branches; in spring by their yellow catkins, or their weeping habits. Willow wood is white, light, soft, porous, generally durable in water. It is used for turning, cabinet work, fuel, and for charcoal-making. The charcoal is highly valued for making crayons and gunpowder. The trees are widely planted in Europe for pollarding (q.v.), to supply fuel, poles, etc.

The most important industry connected with

willows is the growing of osiers (q.v.) for making baskets, wickerwork, etc. The species popularly used in Europe, where the industry is very important, are: the common osier (*S. viminalis*), which yields general purpose rods; fine basket osier (*S. purpurea*); green-leaved osier or ornard (*S. triandra*); golden, or white osier, or willow (*S. alba*); and varieties of these. In America the climate is considered unfavorable to some of the European species and so native species and varieties are more popular. Propagation for osier culture is always by means of cuttings, which are either pieces of branches or single-eye cuttings. The former are made about 15 inches long, planted 15 to 18 inches asunder in rows from 18 to 24 inches apart; the latter are planted very close together so as to produce attenuated shoots of small diameter. The cuttings are planted preferably upon alluvial soils since such produce the finest rods, and will continue profitable much longer than plantations on lighter soils. On light soils the useful age ranges from 15 to 20 years. Plantations are not made upon clay soils since such give unsatisfactory results.

Having been planted the only attention usually given is an occasional shallow cultivation to destroy weeds. After the leaves have fallen the harvest is made, the rods graded, those for brown baskets dried and piled under cover; those for white baskets tied in bundles, placed upright in shallow trenches containing about 3 inches of water until growth starts in the spring when they are peeled by means of a "break." In unfavorable seasons they may require a sort of fermentive process under litter to loosen the bark. The osier industry of Holland, Belgium, France, and England is very extensive. It is mainly confined to low grounds flooded by the tide. In the United States the leading regions of osier culture are western New York, and southeastern Michigan; lesser areas exist near Baltimore, Md., Milwaukee, Wis., and Cincinnati, Ohio. The annual production of baskets in the United States is estimated at approximately \$4,000,000.

The white or Huntingdon willow (*S. alba*) is one of the most widely used European species, but is little grown in America. It is a large tree, often 80 feet high, with usually a short thick trunk often exceeding 3 feet in diameter. It is specially noted for its exceedingly rapid growth and the large number of uses that are made of it, both ornamentally and economically. The brittle willow (*S. fragilis*), a native of Europe and northern Asia, becomes 50 or more feet in height and is well known in America, where it was introduced as a hedge tree about the middle of the 19th century. Stakes cut from the tree in early spring and driven in the ground will soon become trees. It is less useful than the preceding, but is popular for pollarding. Its twigs and smaller branches are very brittle at the point of union with the main stem. The weeping or Napoleon's willow (*S. babylonica*) is a native of the Caucasus, whence it has been taken to most civilized countries throughout the world, in many of which it has become a favorite tree in cemeteries. It has a large number of varieties. The Egyptian willow (*S. aegyptica*) is noted for the perfumed water distilled from its flowers in India.

Among the American species the yellow willow (*S. vitellina*), which is common in the

WILLOW HERB—WILLUGHBY

East, is probably the largest and best known. It approaches in size and habit the Huntingdon willow, with which it was formerly united by botanists. The black willow (*S. nigra*) is also indigenous in the East. It grows about 35 feet tall, and is noted for its rapid distribution along streams into which its brittle twigs fall as they are broken off by every strong wind, and carried far away by the current before they lodge and take root. Other species exhibit this trait more or less also. The pussy willow (*S. discolor*) is also an eastern species well known because of its silky downy catkins which appear in early spring before the leaves. It is usually a shrub, but sometimes becomes a short boled tree 15 or 20 feet high. Its twigs are often gathered in late winter, placed in water in a warm room or greenhouse, and the catkins thus forced into bloom. Treated in this way it is sometimes seen in florists' stores. Other well known American species are *S. lucida* which grows about 12 feet tall, and the heart-leaved willow (*S. cordata*) which grows about twice as large. Some species are popularly called "sallow" in Great Britain. Of these the best known are the long-leaved willow (*S. grandiflora*), gray willow (*S. cinerea*), round-eared willow (*S. aurita*), and round-leaved willow (*S. caprea*). Their chief uses are for hoops, stakes, tools, etc. They are used very little for baskets and wicker-work, since they are usually less pliable than osiers.

A very large number of insects feed upon the willow; 223 have been enumerated by Packard as found in America; in Europe 386 have been recorded. Among these are several species of plant-lice, gall-mites, and scale insects. The larvae of two longicorn beetles bore in the trunk and branches, and a twig-boring larva, the willow-shoot horn-tail (*Phyllacus integer*) bores in the twigs in which the mother deposits her eggs, and in which the pupa state is passed during the winter. The larva of the American cimbex (*Cimbex americana*) which is the largest species of American saw-flies, lives upon the foliage as do also the larvae of another saw-fly, the yellow spotted willow-slug (*Nematus ventralis*).

Consult: Bailey, 'Cyclopedia of American Horticulture' (New York 1900-2); Packard, 'Insects Injurious to Forest Trees' (Washington 1890).

Willow Grouse, or Ptarmigan. See PTARMIGAN.

Willow Herb. See EPILORIUM.

Willow Oak. See OAK.

Willow Pattern, a design used in the manufacture of stone and porcelain ware, generally executed in dark blue, in imitation of a Chinese design. The name is taken from a willow tree, which is a prominent object in the design.

Willow Wren, or Willow Warbler, a European warbler (*Phylloscopus trochilus*), dull olive-green on the upper part of the body, yellowish-white on the breast and below. The nest is placed on the ground, most commonly against a bank among long grass or weeds, but often at the foot of a bush, and, like that of the wood wren, is covered with a dome having a rather wide hole in the side, whence this species and its congeners are called "oven birds." The willow wren is a graceful, active bird, flitting rest-

lessly from twig to twig, and its song is loud and sweet.

Willows, Cal., town, county-seat of Glenn County; on the Southern Pacific Railroad; about 150 miles north by east of San Francisco. In the centre of the town is a grove of willows, the only one in that section, hence the name of the place. The county court-house is a fine building, erected in 1894 at a cost of \$150,000. The town ships large quantities of farm products and fruit. It has a state bank which has a capital of \$300,000. Pop. (1880) 750; (1890) 1,176; (1900) 893.

Wills, William Gorman, Irish dramatist: b. Kilmurry, Ireland, 28 Jan. 1828; d. London 13 Dec. 1891. He was educated at Trinity College, Dublin, studied art in the Royal Hibernian Academy, and for a time engaged as a portrait painter. After 1862, however, he devoted himself extensively to literature, though in 1868 he resumed portrait painting. He was the author of 'Notice to Quit' (1861); 'The Life's Evidence' (1863); and the dramas 'Charles the First' (1872); 'Eugene Aram' (1873); 'Marie Stuart' (1874); 'Jane Shore' (1876); 'Olivia' (1878); 'Sedgemoor' (1881); 'Claudian' (1885); 'A Royal Divorce' (1891); etc., and in conjunction with Sidney Grundy, 'Madam Pompadour.' Consult Archer, 'English Dramatists of To-day' (1882); Cook, 'Nights at the Play' (1883); Freeman Wills, 'W. G. Wills, Dramatist and Painter' (1898).

Wills, William Henry, English writer: b. Plymouth, England, 13 Jan. 1810; d. Welwyn, Hertfordshire, 1 Sept. 1880. He was a member of the original staff of 'Punch,' acting as dramatic critic and also contributing both prose and verse. His contributions included: 'Natural History of Courtship'; 'Comic Mythology'; 'Information for the People'; etc. In 1846 he became associated with Dickens, with whom he formed a lifelong friendship, as sub-editor of the *Daily News*. In 1849 he became assistant editor of 'Household Words' and in 1850 of 'All the Year Round.' He published 'Old Leaves Gathered from Household Words' (1860).

Wills, William John, Australian explorer: b. Totnes, Devonshire, 5 Jan. 1834; d. Cooper's Creek, Australia, about 1 July 1861. He studied medicine in London, and in 1852 emigrated to Australia where he was joined in the following year by his father, and together they practised medicine at Ballarat. In 1855, however, he became a surveyor of crown lands and in 1858 was appointed to the staff of the magnetic and meteorological observatory at Melbourne. In 1860 he joined the expedition under Robert O'Hara Burke (q.v.) as third in command, later becoming second, and crossed the continent northward, reaching the Gulf of Carpentaria, but on the return journey both Burke and Wills died of starvation. Wills' journal was recovered and published: 'A Successful Exploration from Melbourne to the Gulf of Carpentaria, from the Letters and Journals of William John Wills' (1863). Consult Howitt, 'History of Discovery in Australia' (1865).

Willughby, wil'-o-bi, Francis, English ornithologist: b. Wollaton Hall, Nottinghamshire, 1635; d. 3 July 1672. He studied at Cambridge, where he became the pupil of the famous natur-

WILMERDING—WILMINGTON

alist, John Ray (q.v.), and with him made a continental tour (1663-4), making studies and collecting zoological specimens. Ray edited and translated his Latin 'Ornithologia' (1676) and in 1678 published it in English as 'The Ornithology of Francis Willughby.' Ray also edited Willughby's 'History of Fishes' (1686). To the 'Ornithologia' Buffon and Linnæus were much indebted, and it is claimed that Willughby originated the Linnæan system of zoological classification.

Wilmerding, Pa., borough in Allegheny County; on the Pennsylvania Railroad; eight miles southeast of Pittsburg. It was founded in 1859. It was laid out by the Westinghouse Air-brake Company, who have here their large manufacturing works. The water supply comes from the Monongahela River; natural gas is used for fuel, and every street is sewered. Pop. (1890) 419; (1900) 4,179.

Wilmington, Del., city, port of entry, county-seat of New Castle County; on the Delaware River at the junction of the Brandywine and Christiana creeks, and on the Pennsylvania (Philadelphia, Baltimore & Washington), the Baltimore & O., and the Philadelphia & R. R.'s; about 27 miles southwest of Philadelphia and 70 miles northeast of Baltimore. There are several regular lines of steamers, for passengers and freight, which connect the city with Philadelphia and with the Delaware River and Bay and several Atlantic ports. It ranks as the first city in the State in population, commerce, and industries.

Industries.—The chief industrial establishments are car works (the Pullman Company and the Pennsylvania have shops in the city), steel works, machine shops, foundries, paper mills, cotton mills, malleable iron works, fibre goods factories, and furniture. Leather goods, especially morocco, are manufactured here. In 1900 (government census) the 10 manufacturing engaged in turning out leather, tanned, curried, and finished, were capitalized for \$5,107,304 and had 2,454 wage-earners to whom were paid annually \$1,044,303. The total cost of raw material used annually was \$7,000,105 and the value of the finished products was \$9,379,504. The four iron and steel manufacturing were capitalized for \$4,051,880 and the value of the annual output was \$2,934,993. The 21 foundries and machine shops produced each year goods valued at \$3,299,509; the products of the three railroad car-works were, annually, \$3,274,922, not including repair work, which amounted to over \$1,000,000.

Other industries of importance are ship and boat building, meat packing, pulp manufacturing, and large paper-making machinery manufacturing. The total number of manufacturing establishments, in 1900, was 759, which were capitalized for \$28,372,043, and in which were employed 16,055 wage-earners. The total cost of raw material used annually was \$19,451,815, and the value of the annual output, \$34,053,324. Over 53 per cent of the manufacturing establishments of the State were located in Wilmington. A few miles outside the city limits is a large powder-manufacturing establishment, founded in 1801 by Pierre Samuel du Pont and his sons.

Buildings and Municipal Improvements.—The city is on land elevated sufficient to mate-

rially increase its healthfulness. The city extends about four miles back from the Delaware. The houses are nearly all of brick and stone,—no wooden buildings are permitted to go up in the city proper, but the old wooden buildings are allowed to remain. There are five parks, having a total area of 260 acres, and a number of small squares. The streets are well paved and sewered. There is a good water-works system. The principal public buildings are the government building, county courthouse, and city-hall. A building of special interest is the old Swedes' Church (Holy Trinity), built of brick in 1698. It is said to be the oldest building in the United States which has been in continuous use as a church since its erection. The city owns and operates the water-works.

Churches and Charitable Institutions.—The principal religious societies in the city are represented as follows: Methodists (white), 15 churches, (colored), seven churches; Baptist, Roman Catholic, and Protestant Episcopal, 10 each; Presbyterian, nine; Lutheran and Friends, two each; Congregationalist, Adventist, Jewish, Unitarian, and Swedenborgian, one each. There are a large number of charitable institutions; chief among them are the Home for Friendless Children; Saint Peter's Orphanage (R. C.) for girls; Saint Joseph's Home (R. C.) for colored children; two homes for aged men and women; and two hospitals. At Farnhurst, two miles out, is the Delaware State Hospital for the insane, and near it the county almshouse.

Educational Institutions.—The State Industrial Schools for Girls and the Ferris Reform School for Boys are located here. Other educational institutions established here are Hebls School, Wilmington Friends' School, Wilmington Military Academy, Ursuline Academy, a public high school established in 1872, Goldey College, Wilmington Business School, public and parish elementary schools, a free public library, which in 1788 was incorporated as the Wilmington Institute, and which now contains about 41,000 volumes; the Historical Society library, containing nearly 4,000; and the library of the Law Library Association of the county, which has about 16,000 volumes.

Banks and Finances.—There are seven national banks and one state bank with a combined capital of \$1,723,185; three trust companies with a combined capital of \$1,600,000; and a number of loan associations. The annual amount of business is about \$60,000,000. The foreign trade transacted through the port of Wilmington in 1901 amounted to \$4,911,144; which included \$4,679,370 exports. The annual cost for city maintenance and operation is about \$725,000. The principal items of expenditure are \$200,000 for schools; \$84,000 for police; \$41,000 for fire department; \$55,000 for water-works; and \$80,000 for interest on debt.

Government.—The government is vested in a mayor, who holds office two years, and in a council composed of 13 members, who are elected by wards, except the president, who is elected at large. The mayor appoints the board of water commissioners and the board of directors of the street and sewer departments. The council elects the city auditor, city clerk, and inspectors of meat, milk, oil, and markets. The judge of the supreme court appoints the police commissioners. The board of education, two

WILMINGTON

members from each ward, the city attorney, and city treasurer are chosen by popular vote.

History.—The first settlement was made in 1638 by a colony from Sweden, under Peter Minuit. They found here an Indian village called Minquas. The Swedes erected a fort to which they gave the name of Fort Christiana, in honor of the young daughter of Gustavus Adolphus, the king of Sweden. The village was called Christianaham. In 1655, the Dutch from New Netherlands bought the land on which Wilmington now stands, and other lands adjoining, from the Indians, and took forcible possession of the fort. The name was changed to Fort Altena. The Dutch retained possession for nine years, when they were supplanted by the English. It came under control of William Penn, after which the colony gave more attention to civic pursuits instead of wars and conquests. In 1731 the village was named Willingtown, in honor of Thomas Willing, who had laid out the town. Later the name was changed to Wilmington. It was incorporated as a borough in 1739 and the first borough election was held 8 Sept. 1740. In 1832 it was chartered as a city.

Population.—(1880) 42,478; (1890) 61,431; (1900) 76,556; (1903, est., Gov. Report) 83,300.

Consult: Powell, 'Historic Towns of the Middle States'; Ferris, 'History of the Original Settlements on the Delaware.'

Wilmington, N. C., city, port of entry, county-seat of New Hanover County; on the Cape Fear River, and on the Atlantic Coast Line and the Seaboard Air Line R.R.'s. It was first settled in 1730 and was first called New Liverpool and then Newton; in 1739 it was incorporated as a town and named Wilmington, and in 1744 was made the capital of the province. In 1765 the town took a decided stand against British authority, and refused to permit a British man-of-war to land a quantity of stamps, this being the first open armed resistance to the Stamp Act. On 18 July 1775, Fort Johnson, at the mouth of the river, was captured by the militia under Colonel John Ashe; and the royal governor was forced to leave the place. In 1781-2 Wilmington was occupied by the British, Cornwallis having his headquarters here. During the Civil War Wilmington was the most important port of the Southern States, the "gateway" between the South and foreign nations; and was consequently the chief resort of the blockade runners. The harbor and its approaches were strongly fortified by the Confederates; in January 1865, Fort Fisher (q.v.) was taken by the Federals, and this resulted in the evacuation of the other forts and the surrender of Wilmington. Wilmington was chartered as a city in 1866.

It is an important commercial city. Improvements in the harbor and river channel have been made by the Federal government at considerable cost, and the port accommodates vessels of the largest size. There are weekly steamboat lines to New York and points on the Cape Fear and Black rivers, and a large import and export trade, both foreign and domestic. In the fiscal year ending 30 June 1904 the exports amounted to \$21,000,000; the chief shipments are cotton, rice, turpentine, vegetables, lumber, and naval stores. Wilmington ranks fifth in receipts of cotton and fourth in ex-

ports. In manufacturing industries Wilmington ranks fourth in the State. In 1904, capital to the amount of \$5,600,000 was invested in manufacturing establishments, and \$1,380,000 was annually paid in wages; the value of the annual products was \$4,100,000. Eight lumber and timber establishments had an annual output valued at \$1,000,000; other manufactures were turpentine, resin, confectionery, foundry and machine-shop products, ice, chemicals, meal, cotton products, men's clothing, wagons, and carriages. Annual business of the city for 1903 was \$40,000,000 and the annual pay-roll was \$3,250,000. There are five banks with a combined capital of \$520,000 and deposits amounting to \$4,500,000. The principal public buildings are the government building, the county court-house, city-hall, Masonic Temple, the county hospital, the United States Marine Hospital, and the James Walker Memorial Hospital and W. H. Sprunt Annex. Other institutions are a county house of correction, county home, and the Catherine Kennedy Home for Aged Women. Various organizations assist the charitable institutions; such are the Bureau of Associated Charities, Ladies' Benevolent Society, a United Charities, and a Seaman's Friend's Society. There are 33 churches, 14 of which are for colored. There are public schools for white and for colored students, Roman Catholic parish schools, and a public library; and the city also contains Cape Fear Academy, Alderman's School, Academy of the Incarnation, and the Gregory Normal School (for the colored race). The government is administered under the charter of 1866, which provides for a mayor, who holds office two years, and a city council. The governor of the State appoints a board of audit and finance, who determine the salaries and control the municipal finances. The council elect many of the city officials. Pop. (1890) 20,056; (1900) 20,976; (1903, est., Government report) 21,252; (1904, est.) 25,000. Wilmington ranks as the first city of the State in population.

Revised by

WILMINGTON CHAMBER OF COMMERCE.

Wilmington, Ohio, city, county-seat of Clinton County; on the Cincinnati & Muskingum Valley and the Baltimore & O. R.R.'s; about 53 miles northeast of Cincinnati and 60 miles southwest of Columbus. It is in an agricultural region. The chief manufacturing establishments are bent-wood and bridge-work factories, furnaces, machine shops, auger bit factory, creameries, and flour and lumber mills. The Wilmington College (Orthodox Friends) was established here in 1870. The two banks have a combined capital of \$200,000. Pop. (1890) 3,079; (1900) 3,613.

Wilmington, Capture of. After Gen. Terry's capture of Fort Fisher (q.v.) 15 Jan. 1865, Terry posted his troops on an intrenched line across the peninsula, about two miles above the fort. An advance on Wilmington was not considered prudent until he could be reinforced, as Gen. Hoke, the Confederate commander, was holding Fort Anderson, on the west bank of Cape Fear River, about midway between Fort Fisher and Wilmington, and on the opposite bank had thrown up a line of intrenchments across the peninsula in Terry's front, behind which he had about 4,500 men. Fort Anderson was an extensive earthwork, mounting 10 heavy

WILMINGTON COLLEGE — WILMOT

guns, commanding the approaches by land and water and held by Gen. Hagood's brigade of 2,000 men. Gen. Grant ordered Gen. Schofield, with the Twenty-third corps, from Tennessee to the coast of North Carolina to co-operate with Gen. Sherman. Schofield's troops arrived at Alexandria and Washington late in January, where they were detained some days by the ice in the Potomac. Gen. Cox's division of 4,400 men went by steamers from Alexandria and landed on the peninsula, in rear of Terry, 9 February, raising Terry's command to 8,000 men. Schofield now took command; the fleet under Admiral Porter occupied positions in Cape Fear River and off the coast, covering both flanks of Terry's line, and, 11 February, Terry was pushed forward, supported by Cox, drove in Hoke's pickets and intrenched within 500 yards of his main line. An attempt on the 12th to turn Hoke's left by a co-operation of the army and navy was foiled by high winds and a violent storm. On the night of the 14th an attempt was made to move the pontoons upon their wagons along the beach with the troops; the wagons sank deeply in the sand, progress was very slow and it having become evident that the pontoons could not be got up to the point of crossing of Masonborough Sound before daylight, when the enemy would discover the movement, the attempt was abandoned and attention turned to Hoke's right, where it would not be required to contend with the difficulties of both land and sea. On the 16th Cox's and Ames' divisions were crossed by steamboats to Smithville, on the right bank of the river, where they were joined by Col. O. H. Moore's brigade, of Couch's division, and a battery, and, on the 17th Cox with four brigades and the battery advanced along the main Wilmington road, driving in the Confederate pickets and bivouacking near Fort Anderson, with his right resting on the river. Next morning the advance was resumed and the enemy driven within the works. Moore's and Henderson's brigades were intrenched on the south side of the fort, while Cox, with his other two brigades, followed later by Ames' division, started around Orton Pond, covering the Confederate right, to gain the Wilmington road in rear of the fort, the distance to be traveled being about 15 miles. The guns of Fort Anderson opened fire on the two brigades confronting the fort, and the gunboats opened heavily on the fort, the monitor Montauk lying close to it and the others enfilading its parapet. Gen. Hagood, warned by his cavalry of Cox's movement around his right, hastily abandoned Fort Anderson during the night, taking with him six light guns and falling back behind Town Creek, eight miles above the fort. Hoke also retreated from his lines opposite Fort Anderson to within four miles of Wilmington. By these movements Schofield gained possession of the main defenses of Cape Fear River and of Wilmington, with several pieces of heavy ordnance and a large amount of ammunition, and with but small loss. In this he had the assistance of the gunboats that moved up the river removing torpedoes and silencing batteries on both banks. On the 19th Cox pursued Hagood to Town Creek, behind which and near its mouth he was found intrenched and had destroyed the only bridge. The creek was not fordable and could not be bridged. Terry also advanced on the east side of the river, following Hoke, and

found him in force, and Ames' division was recrossed to the east bank and joined Terry in the night. Terry again advanced on the morning of the 20th and after some sharp skirmishing came upon Hoke well intrenched with artillery in position. On the same day Cox crossed Town Creek below Hagood's position, by the use of a single flat boat found in the stream, which carried 50 men at a trip, and, by marching through woods and swamps, reached Hagood's flank and rear, attacked and routed his brigade, after a stubborn resistance, capturing two guns, three battle-flags, and 375 prisoners, including Col. Simonton, temporarily commanding the brigade, and nearly all the officers. During the night Cox rebuilt the bridge over Town Creek, crossed his artillery, and the next morning pushed on toward Wilmington without opposition. Terry was unable to make any farther advance, but occupied Hoke's attention, so that he could not send any part of his force to replace the losses in Hagood's brigade. On the 21st Cox secured a portion of the Confederate pontoon bridge across Brunswick River, which Hoke had endeavored to destroy, put the 16th Kentucky regiment onto Eagle Island abreast Wilmington and threatened to cross Cape Fear River above the town. Hoke at once set fire to steamers, boats, cotton, and naval stores, and abandoned the place, retreating in the direction of Goldsboro. Gen. Terry entered the place without opposition early in the morning of 22 February and pursued Hoke across Northeast River. Schofield reports that he took 51 heavy guns, 15 light ones, and a large amount of ammunition. The Union loss from 11 February to the capture of Wilmington on the 22d was about 200 killed and wounded. The Confederate loss is not definitely known, Schofield estimates it at not less than 1,000, in killed, wounded and prisoners. Consult 'Official Records,' Vol. XLVII.; Cox, 'March to the Sea'; Cox, 'Military Reminiscences of the Civil War,' Vol. II.

E. A. CARMAN.

Wilmington College, located at Wilmington, Ohio. It was opened to students in 1870, and chartered in 1875, under the auspices of the Society of Friends. It is open to women on equal terms with men. The college organization includes a preparatory school. Two full collegiate courses are offered, the classical, for which Greek is required, leading to the degree of A.B., and the scientific, leading to the degree of B.S.; a part of the work of the last two years is elective in both courses. A course in bookkeeping is included in the curriculum. The degrees of A.M. or M.S. are conferred for graduate work. There are six county scholarships, and three others; and a student loan fund. The campus consists of 12 acres, and is located in the eastern suburbs of Wilmington. The buildings include the main building, the observatory, South Hall (men's dormitory), the women's dormitory, the gymnasium, and the Auditorium. The library in 1904 contained over 3,000 volumes; the students numbered 120, of whom 42 were in the college.

Wil'mot, David, American jurist and politician: b. Bethany, Pa., 20 Jan. 1814; d. Towanda, Pa., 16 March 1868. He was admitted to the bar in 1834, and practised at Towanda. He was a member of Congress in 1845-51; was elected as a Democrat, but stood

WILMOT — WILSON

in opposition to the extension of slavery into prospective new territory of the United States; and in 1846 he offered the famous amendment known as the Wilmot Proviso (q.v.). He supported Van Buren in 1848 against Cass, the regular Democratic candidate, and later joined the Republicans. In 1853-61 he was president-judge of the 13th district of Pennsylvania, in 1857 was an unsuccessful Republican candidate for governor of that State, sat in the United States Senate from 1861 to 1863, and from that time until his death served as judge of the United States Court of Claims.

Wilmot, John. See ROCHESTER, JOHN WILMOT, 2D EARL OF.

Wilmot, Robert Duncan, Canadian statesman: b. Fredericton, New Brunswick, 16 Oct. 1809; d. Oromocto, New Brunswick, 11 Feb. 1891. He was educated in Saint John, engaged for a time in shipping, and 1846 entered Parliament, where he sat for Saint John until 1861 and again in 1865-7. He was mayor of Saint John in 1849, surveyor-general of New Brunswick, and member of the executive council of the province in 1851-4, provincial secretary in 1856-7, and a delegate to the colonial conference in London, in 1866-7. He became a member of the Senate in 1865, of the privy council in 1878, was speaker of the Senate in 1878-80, and in 1880-5 was lieutenant-governor of New Brunswick.

Wilmot Proviso, an amendment offered in the United States Congress by David Wilmot (q.v.), 8 Aug. 1846, pending the consideration of a bill placing \$2,000,000 at the disposal of President Polk to negotiate a peace with Mexico. The amendment was as follows:

Provided, that, as an express and fundamental condition to the acquisition of any territory from the republic of Mexico by the United States, by virtue of any treaty which may be negotiated between them, and to the use by the executive of the moneys herein appropriated, neither slavery nor involuntary servitude shall ever exist in any part of said territory, except for crime, whereof the party shall first be duly convicted.

It was adopted in the House, and was under debate in the Senate when the hour arrived previously fixed for adjournment of the session. At the next session (8 Feb. 1847) Wilmot again introduced it, and a fierce and angry contest began. The House remained firm in favor of the amendment, and it was passed (15 February) by a decided majority, but was not acted on by the Senate. It caused great agitation throughout the country. The principle involved long continued to be an important factor in party politics, its influence being affected by many fluctuations of opinion and political action; and it may be said finally to have triumphed through the act of 19 June 1862 forbidding slavery in "any of the territories of the United States now existing, or which may at any time hereafter be acquired." Consult: Stephens, 'Constitutional View of the Late War Between the States' (1868-70); Wilson, 'Rise and Fall of the Slave Power' (1872-7); Schouler, 'History of the United States of America Under the Constitution' (new ed. 1899); Von Holst, 'Constitutional and Political History of the United States' (new ed. 1899).

Wilson, Alexander, American ornithologist: b. Paisley, Scotland, 6 July 1766; d. Philadelphia, Pa., 23 May 1813. In his 13th year he was apprenticed to a weaver, but after seven years abandoned the loom and adopted the life of a pedlar. Three years were thus spent and in 1789, having already prepared a volume of poems for publication, he offered his musings and solicited subscriptions for this work. It was published in 1790, but had little success; and he again returned to the loom. In 1792 he published 'Watty and Meg,' which, having appeared anonymously, was ascribed to Burns, though the style is very different. It is said to have had a sale of 100,000 copies in a few weeks. Having written a severe satire upon a person in Paisley Wilson was thrown into prison, and was afterward compelled to burn the libel with his own hand at Paisley Cross. Upon his release he came to this country, arriving at Newcastle, Delaware, in 1794. He again resumed his former trade, but soon turned schoolmaster, acting in this capacity in several places in Pennsylvania. While thus engaged at Kingsessing, near Philadelphia, he became acquainted with William Bartram, the naturalist, and Alexander Lawson, an engraver, whose tastes and instructions stimulated his own talents. He had already undertaken long excursions for making ornithological researches, and devoted much time to the study, when he was engaged, in 1806, to assist in editing the American edition of Rees's Cyclopaedia, and now began to prepare for the publication of his 'American Ornithology,' the first volume appearing in 1808, and the seventh in 1813. The interval had been passed in exploring different parts of the country for the purpose of extending his observations, collecting specimens, and watching the habits of birds in their native haunts. In 1813 the literary materials for the 8th volume of the 'Ornithology' were ready, but its progress was greatly retarded for want of proper assistants to color the plates. Wilson was, therefore, obliged to undertake the whole of this department himself, in addition to his other duties; and these multifarious labors soon exhausted his strength and brought about his death. All the plates for the remainder of the 'Ornithology' having been completed under Wilson's own eye the letter-press of the 9th volume was supplied by his friend, George Ord, his companion in several of his expeditions, who also wrote a memoir of Wilson to accompany the last volume, and edited the eighth. Four supplementary volumes, containing American birds not described by Wilson, were published by Charles Lucien Bonaparte (1825-33). An edition of the original work, with Bonaparte's continuation, and notes and life of Wilson by Sir William Jardine, was published in London in 1832. Wilson continued to write poetry after leaving Scotland, one of his chief productions being 'The Foresters,' a poem describing a pedestrian tour to the Falls of Niagara, and several collective editions of his poems have appeared. A bronze statue of Wilson has been erected at Paisley.

Consult: 'Life of Wilson,' by Peabody, in Sparks' 'Library of American Biography' (1834-56); Brightwell, 'Difficulties Overcome: Scenes in the Life of Alexander Wilson' (1860); Paton, 'Alexander Wilson, the Ornithologist' (1863).

WILSON

Wilson, Allen Benjamin, American inventor: b. Willet, N. Y., 18 Oct. 1824; d. Woodmont, Conn., 29 April 1888. He was a cabinet maker by trade, but in 1849 invented a sewing machine which made a stitch at each movement of the shuttle, thus enabling the operator to make an endless seam at any curve, and thereafter devoted himself to its improvement. In 1851 he secured a patent for the rotating hook, and a year later invented the four-motion feed, which was subsequently adopted in all machines. In 1800 he entered into partnership with Nathaniel Wheeler (q.v.), with whom he established, at Bridgeport, Conn., the then largest factory in the world for the manufacture of sewing-machines. In 1852, however, on the re-organization of the firm, he withdrew from the business and settled in Waterbury, where he engaged in other enterprises. See SEWING MACHINES.

Wilson, Alpheus Waters, American bishop of the Methodist Episcopal Church, South: b. Baltimore, Md., 5 Feb. 1834. He was educated at Columbian College, Washington, D. C., was received into the Baltimore Methodist Conference in 1853, and on the organization of the Baltimore Conference of the Methodist Church, South, identified himself with that body. He became the secretary of the board of missions of his Church in 1878 and was elected bishop in 1882.

Wilson, Sir Archdale, English soldier: b. Diddington, Norfolk, 1803; d. London 9 May 1874. He entered the Bengal Artillery in 1819; distinguished himself at the siege of Bhartpur 1825-6, and took part in the Sikh war 1848-9. At the outset of the Sepoy revolt in May 1857 he was the earliest officer to encounter the Sepoys in battle, defeating them on May 30 and 31, and succeeding to the command of the force before Delhi in July, held his position until 14 September, when the city was taken. He was rewarded for his services with a baronetcy, was promoted major-general, made lieutenant-governor in the following March, and took part in the siege and capture of Lucknow 19 March 1858.

Wilson, Augusta Jane Evans, American novelist: b. Columbus, Ga., 8 May 1835. She was married to L. M. Wilson of Mobile in 1868. Her writings include: 'Inez, a Tale of the Alamo' (1856); 'Beulah,' the most popular of her novels (1859); 'Macaria' (1864); 'St. Elmo,' parodied by Webb in 'St. Twel'mo' (1866); 'Vashti' (1869); 'Infelice' (1875); 'At the Mercy of Tiberius' (1887); 'A Speckled Bird' (1902). The earlier books had a great popularity. They attempted to be massive, but contained no permanent elements, though attaining at times some power of expression. The later volume, written in the same manner, did not obtain recognition.

Wilson, Sir Charles Rivers, English financier: b. London 1831. He was graduated from Oxford in 1851, became a treasury clerk in 1856, was private secretary to Disraeli 1867-8, and comptroller-general of the National Debt Office 1874-94. He became one of the British administrators of the Suez Canal in 1876 and was finance minister to the Khedive of Egypt 1877-9.

Wilson, Sir Daniel, Canadian archaeologist: b. Edinburgh 5 Jan. 1816; d. Toronto, Ont., 7 Aug. 1892. He was educated at Edinburgh

University, and on leaving college entered with earnestness into antiquarian pursuits, and published in 1847, 'Memorials of Edinburgh in the Olden Time.' It was followed by 'Oliver Cromwell and the Protectorate' (1848) and 'The Archaeology and Prehistoric Annals of Scotland' (1851). At this time he was secretary of the Scottish Society of Antiquaries, but in 1853 was called to fill the chair of history and English literature in the University of Toronto. While resident in Canada he published 'Prehistoric Man' (1862, revised 1876); 'Chatterton, a Biographical Study' (1869); 'Caliban, the Missing Link' (1873); 'Spring Wild-Flowers' (1875), a volume of poems; 'Reminiscences of Old Edinburgh' (1878); 'Anthropology' (1885); 'The Right Hand: Left-handedness' (1891). In 1881 he became president of Toronto University, a position which he held until his death. In recognition of his services to education and literature he was knighted in 1888.

Wilson, Florence, commonly known by the Latinized form of his name, "FLORENTIUS VOLUSENUS," Scotch theologian: b. near Elgin about 1500; d. Vienne, Dauphiny, France, 1547. He was educated at King's College, Aberdeen, became a member of the household of the learned Cardinal du Bellay, archbishop of Paris, and was appointed by Cardinal Sadolet master of the public school of Carpentras. Here he wrote his famous dialogue 'The Tranquillity of Mind' (1543), much prized for its classical erudition and the beauty of its Latin style.

Wilson, Floyd Baker, American lawyer and author: b. Watervliet, N. Y., 23 June 1845. He was graduated from the University of Michigan in 1871 and from the Cleveland Law College (now Adelbert University) in 1873. Admitted to the bar in 1873, he practised in Cleveland till 1880 and since the year last named in New York, making a specialty of corporation law. He is the author of 'Uphill,' a novel (1880); 'Paths to Power' (1901) and has translated 'La Coja y el Encogidido' (1901).

Wilson, Francis, American actor: b. Philadelphia, Pa., 7 Feb. 1854. He made his first appearance on the stage in a minstrel company, his debut in regular comedy occurring at the Chestnut Street Theatre, Philadelphia, in 1877. He played in various parts with much success and made his initial appearance in comic opera as Sir Joseph Porter in 'Pinafore.' He later became leading comedian in different New York theatres and afterward organized his own company, himself playing the leading comedy roles. He has published: 'The Eugene Field I Knew'; 'Recollections of a Player'; and 'Going on the Stage.'

Wilson, George, Scottish chemist, brother of Sir Daniel Wilson (q.v.): b. Edinburgh 21 Feb. 1818; d. 22 Nov. 1859. He was educated at the Edinburgh University; became a popular lecturer on chemistry and in 1855 was appointed professor of technology in Edinburgh University. Among his scientific works were 'Text-book of Chemistry' (1850); 'Researches in Color-blindness' (1855); and 'The Five Gateways of Knowledge' (1856), a delightful hymn or prose-poem of science.

Wilson, Harry Leon, American novelist: b. Oregon, Ill., 1 May 1867. He has edited 'Puck' from 1896 and is the author of 'Zig

WILSON

Zag Tales' (1896); 'The Spenders' (1902); 'The Lions of the Lord' (1902).

Wilson, Henry, American statesman: b. Farmington, N. H., 16 Feb. 1812; d. Washington 22 Nov. 1875. His name was originally Jeremiah Jones Colbath, legally changed to Henry Wilson on his reaching manhood. He was a farm apprentice in his native town till the age of 21, when he moved to Natick and learned the shoemaker's trade. After two years' work at this business he had accumulated a small sum of money, which enabled him to attend the academies at Stafford, Wolfborough, and Concord. But the loss of some of his money forced him to cut short his plan for an education, and he returned to his work at Natick in 1838, and finally built up a prosperous shoe factory. In 1840 he took an active part in the presidential campaign in behalf of the Whig party, and in the same year was elected to the lower house of the Massachusetts legislature; was re-elected. In 1848 he withdrew from the Whig party be-State senate. At this time he became known as an active opponent of slavery, and in 1845 was selected with J. G. Whittier (q.v.) to present to Congress the anti-slavery petition from Massachusetts against the annexation of Texas. In 1848 he withdrew from the Whig party because of its rejection of anti-slavery resolutions, and took a prominent part in organizing the Free Soil party, purchasing and editing the *Boston Republican* in the interests of that party. In 1850 and 1851 he was elected to the State senate, and was president of that body during both terms. In 1852 he was president of the Free Soil National Convention, and chairman of the national committee; and in 1853 was a member of the Massachusetts Constitutional Convention. In 1855 he was elected to the United States Senate, and shortly after taking his seat made a speech advocating the repeal of the fugitive slave law and the abolition of slavery in the District of Columbia and in the Territories. For a time in 1855 he was associated with the American party; but on its adoption of a pro-slavery platform he withdrew from it and took an active share in organizing the Republican party on the basis of opposition to the extension of slavery. In 1856 he denounced the assault of Brooks on Sumner, and was challenged to a duel by Brooks; though he refused the challenge, he stated that he believed in his right to defend himself if attacked. During the years of 1856-60 he took part in all important debates in the Senate; and his speech in defense of free labor, in reply to Senator Hammond of South Carolina was widely circulated in the Northern States. In January 1859 he was re-elected to the Senate by an almost unanimous vote of the Massachusetts legislature; and on the assembling of the Senate in 1861, was made chairman of the committee on military affairs, a post which the Civil War rendered one of great labor and responsibility. In this capacity he introduced and carried through Congress, during the extra session of 1861, the acts to authorize the employment of 500,000 volunteers, to increase the regular army, and to reorganize the military system. In 1865 he was a third time elected to the Senate, and took a prominent part in all the reconstruction measures, favoring the granting of full civil and political rights to the negroes, but also desiring a liberal treatment of the

Southern whites. In 1871 he was re-elected to the Senate, but resigned in the next year, when elected to the vice-presidency of the United States on the Republican ticket. In 1873 he suffered a stroke of paralysis from which he never fully recovered. At the time of his death he was engaged in writing the last volume of his 'History of the Rise and Fall of the Slave Power in America' (1873-5), which he left partially incomplete. He also wrote: 'History of the Anti-Slavery Measures of the 37th and 38th United States Congresses' (1865); 'Military Measures of the United States Congress' (1866); 'Testimonies of American Statesmen and Jurists to the Truths of Christianity' (1867); 'History of the Reconstruction Measures of the 39th and 40th Congresses, 1865-8' (1868). Consult: Russell and Nason, 'Life and Public Services of Henry Wilson' (1872); Stowe, 'Men of Our Times' (1868).

Wilson, Henry Bristow, English Anglican clergyman: b. London 1803; d. Lee, Kent, 10 Aug. 1888. He was educated at Oxford, took orders in the Church of England and was one of the four Oxford tutors who in 1841 sent a protest to the editor of 'Tracts for the Times.' He later became professor of Anglo-Saxon at Oxford, in 1851 vicar of Great Staughton, Huntingdonshire, and was one of the seven clerical authors of the famous volume of 'Essays and Reviews' (1860); his contribution being 'The National Church.' He was tried for heresy before the court of Arches but his sentence of a year's suspension from his benefice was reversed by the privy council. He was also the author of 'The Communion of Saints: An Attempt to Illustrate the Principles of Church Union' (1851), the Bampton lecture contributed to 'Oxford Essays.'

Wilson, Horace Hayman, English Orientalist: b. London 26 Sept. 1786; d. there 8 May 1860. Educated for the medical profession, in 1808 he went to Bengal as assistant surgeon in the service of the East India Company, but soon obtained an office in the Calcutta mint, of which he afterward became assay-master and secretary. His leisure was devoted to the study of Sanskrit, and so soon did he become known as an able Sanskrit scholar that in 1812 he was elected secretary of the Asiatic Society of Bengal. He acted for many years as secretary of the committee of public education, and his exertions contributed to revive the interest of the Hindus in their own literature as well as to create among them an interest in the science and literature of Europe. He remained in India till his election in 1832 to the Boden professorship of Sanskrit at Oxford University, and soon after his return to England was appointed librarian at the India House, and elected a fellow of the Royal Society. Among his numerous publications are: 'The Megha Duta, or Cloud Messenger,' a Sanskrit poem, with an English translation, notes, etc. (1813); 'Sanskrit-English Dictionary' (1819); 'Hindoo Theatre,' select specimens translated from the original Sanskrit (1827); 'The Vishnu Purana—a System of Hindu Mythology and Tradition,' translated from the original Sanskrit and illustrated by notes (1840); 'Grammar of the Sanskrit Language for the Use of Early Students' (1841); 'Rig-Veda Sanhita,' translated from the original Sanskrit (1850-88), the last vol-

WILSON

umes being prepared by Cowell and Webster, after Wilson's death.

Wilson, James, American jurist: b. near Saint Andrews, Scotland, 1742; d. Edenton, N. C., 28 Aug. 1798. Educated at the universities of Glasgow, Saint Andrews and Edinburgh, he came to America in 1763 and settled in Philadelphia in 1766. After tutoring in what is now the University of Pennsylvania he studied law and was admitted to the bar in 1767. He sat in the Pennsylvania provincial convention in 1774 and in the Continental Congress 1775-7, 1782-3, and 1785-87, and was a signer of the Declaration of Independence. He served as delegate in the Constitutional Convention of 1787, taking a prominent part in the debates and later helping to secure the ratification of the Federal Constitution by Pennsylvania (1790). His speeches in these conventions have been highly commended for their profound comprehension of constitutional theory. In September 1789, he was appointed an associate justice of the United States Supreme Court and in 1790 became professor of law in the University of Pennsylvania. His writings include such important pamphlets as 'Considerations on the Nature and Extent of the Legislative Authority of the British Government' (1774); 'Address to the Citizens of Philadelphia' (1784). Consult his 'Works,' edited by his son, Bird Wilson (1803-4), and Andrews (1896).

Wilson, James, American globe maker: b. Londonderry, N. H., 1763; d. Bradford, Vt., 26 March 1855. Up to the age of 33 he was a farmer in his native place, at the same time reading and studying geography and astronomy. In 1796 he moved to Bradford, Vt., where he began experimenting with balls turned from blocks of wood and covered with paper. This rude beginning was followed by a much better method. The solid balls were thickly covered with layers of paper firmly pasted together, and this shell was then divided into hemispheres, which being removed were again united, and finished with due regard to lightness, strength and smoothness. He procured copper plates of sufficient size for his 13 inch globes, protracted his maps on them in sections, tapering as the degrees of longitude do from the equator to the poles and engraved them with such admirable accuracy of design, that when cut apart and duly pasted on his spheres, the edges with their lines, and even the different parts of the finest letters would perfectly coincide and make one surface, truly representing the earth or celestial constellations. He published his first globes in 1814. When past 80 he constructed a machine which illustrated the daily and yearly revolutions of the earth; the cause of the successive seasons; and the sun's place for every day of the year, in the ecliptic. These movements were produced by turning a crank, which caused the earth to revolve about the sun in the plane of the ecliptic, always retaining its true relative position. For want of a more definite name the machine was called Wilson's Planetarium. The large copper plate, on which are printed the months of the year, with their days, and the corresponding signs of the zodiac with their degrees, was engraved by Wilson after he was 83 years of age.

Wilson, James, American politician: b. Ayreshire, Scotland, 16 Aug. 1835. He came with his parents to the United States in 1852, and settled in Iowa in 1855. He was educated at Iowa College, engaged in farming in 1861, and in that year was elected to the State legislature, where he served for three terms, acting as speaker for the last two years. He was a member of Congress in 1872-7, State railway commissioner in 1877-83, and in 1883-5 was again a member of Congress. He was a regent of the State University in 1870-4, and in 1890-7 was director of the Agricultural Experiment Station and professor of agriculture at the Iowa Agricultural College, Ames, Iowa. He was appointed secretary of agriculture by President McKinley in 1897, was reappointed in 1901, and retained in office by President Roosevelt upon his accession to the presidency.

Wilson, James F., American politician: b. Newark, O., 19 Oct. 1828; d. Fairfield, Ia., 22 April 1895. He studied law, settled at Fairfield, Ia., in 1853, was elected to the convention for a revision of the State constitution in 1856, sat in both houses of the State legislature, and was president of the senate in 1861. From 1861 to 1869 he was a member of Congress, where he was chairman of the judiciary committee and one of the managers of the impeachment of Andrew Johnson. In 1883 he was elected to the United States Senate, and in 1889 re-elected. He was made a commissioner for the Pacific railway.

Wilson, James Grant, American author: b. Edinburgh, Scotland, 28 April 1832. He was brought to this country in infancy by his father, William Wilson (q.v.), served in the Union army during the Civil War, and reached the rank of brigadier-general. After the war he settled in New York and has been president of the New York Genealogical and Biographical Society from 1884. Among his numerous publications are: 'Biographical Sketches of Illinois Officers' (1862-3); 'Love in Letters, Illustrated in the Correspondence of Eminent Persons' (1867); 'Life of Fitz-Greene Halleck' (1869); 'Sketches of Illustrious Soldiers' (1874); 'Poets and Poetry of Scotland' (1876); 'Centennial History of the Diocese of New York, 1775-1885' (1886); 'Bryant and His Friends' (1886); 'Commodore Isaac Hull and the Frigate Constitution' (1889); 'Life of General Grant' (1897); 'The Presidents of the United States' (1901); 'Thackeray in the United States' (1903). He was the editor (with John Fiske) of 'Appleton's Cyclopædia of American Biography' (6 vols. 1886-9), and alone, of 'Memorial History of the City of New York' (1892-3).

Wilson, James Harrison, American soldier: b. near Shawneetown, Ill., 2 Sept. 1837. He was graduated from West Point in 1860, was promoted lieutenant in 1861, and was chief topographical engineer on the Port Royal expedition. He was brevetted major for conduct at Fort Pulaski, Ga., and subsequently was aide-de-camp to General McClellan, participating in the battles of Antietam and South Mountain. In the campaign against Richmond and in the operations against Chattanooga and Knoxville he was assistant engineer and inspector-general of the Army of Tennessee, and in 1863 was made brigadier-general of volunteers, and

WILSON

brevet lieutenant-colonel of regulars for gallantry at Chattanooga. He was brevetted colonel for conduct at the battle of the Wilderness, and was engaged in the siege of Petersburg and in the Shenandoah campaign. In September 1864 he was transferred to the command of the cavalry of the Mississippi Division, took part in General Thomas' campaign in Tennessee and was conspicuous at the battles of Franklin and Nashville. In March 1865 he made a raid into Alabama and Georgia and in 28 days captured Selma, Montgomery, Columbus, and Macon, taking 6,820 prisoners, among whom was Jefferson Davis. He received brevet rank as brigadier- and major-general and in 1866 was mustered out of the volunteer service. He was appointed lieutenant-colonel in the regular army in that year, but resigned in 1879, and was subsequently engaged in railroad engineering until the outbreak of the Spanish-American war when he was appointed major-general of volunteers and was assigned to command a division in Porto Rico. He was retired with the rank of brigadier-general of regulars in 1901. In 1902 he represented the United States army at the coronation of Edward VII. He has published, with C. A. Dana, 'Life of General Grant' (1868); 'Life of Andrew Alexander' (1887); 'China, Travels and Investigations in the Middle Kingdom' (1887-1900).

Wilson, Jeremiah Morrow, American jurist: b. Warren County, Ohio, 25 Nov. 1838; d. Washington, D. C., 24 Sept. 1901. He received an academic education; was judge of the Court of Common Pleas of Fayette County, Ind., 1860-5; judge of the Circuit Court 1865-71, and member of Congress in 1871-5. After retiring from Congress he took up the practice of law in Washington, D. C., and during his professional career in that city was connected with numerous famous cases. Besides having acted as attorney for the Union Pacific Railroad and the Mormon Church, he was counsel in the court-martial of General Swain, and was connected with the "Alabama Claims" and the French "Spoliation" cases; etc.

Wilson, John, American colonial clergyman: b. Windsor, England, 1588; d. Boston, Mass., 7 Aug. 1667. He was educated at King's College, Cambridge; was made fellow there; studied law, but took orders; was minister of Sudbury, Suffolk; and having frequently been suspended as a Puritan, embarked with John Winthrop for America in 1630 and landed at Salem, Mass. At Charlestown he organized what afterward became the First Church of Boston, of which he was ordained pastor in 1632. He was opposed to the so-called "Antinomian heresy" of the time; was associated with John Eliot in missionary work among the Indians; and was chaplain to the force sent in 1639 against the Pequots of Connecticut. He published: 'Some Helps to Faith' (1625); a poem, 'Famous Deliverances of the English Nation' (1626); a Latin poem commemorating John Harvard; and 'The Day Breaking, If Not the Sun Rising, of the Gospel' (1647; new ed. 1805). He had, says Cotton Mather, "so nimble a faculty of putting his devout thoughts into verse, that he signalized himself by . . . sending poems to all persons, in all places, on all occasions."

Wilson, John, Scottish author, best known by his pseudonym "CHRISTOPHER NORTH": b. Paisley 18 May 1785; d. Edinburgh 3 April 1854. He was educated at Glasgow University and Magdalen College, Oxford, and while at Oxford was noted for his skill in boating, cricketing, and other athletic sports. Having at 21 come into a large fortune, he purchased the property of Elleray, on Windermere, and retired there to live at his ease, writing poetry, and engaging in field sports and occasional wild frolics, to which the exuberance of his animal spirits was ever impelling him. In 1812 he wrote the once-famed 'Isle of Palms.' Another poem, in dramatic form, 'The City of the Plague' (1816), was still more successful; but is now forgotten. Wilson's fame with posterity rests on his prose writings, and more especially his contributions to 'Blackwood's Magazine.' Among the numerous papers furnished by Wilson may be mentioned those celebrated ones on fishing, shooting, and kindred pursuits, produced under the well-known sobriquet of "Christopher North," and above all his renowned 'Noctes Ambrosianae,' a series of conversations on literary and general subjects, supposed to take place at certain convivial meetings held in Ambrose's Tavern by the contributors to the 'Magazine' and since reprinted separately. In 1820 he obtained the chair of moral philosophy in the University of Edinburgh, a post he occupied with credit for 32 years. In 1822 to 1824 he published three prose works of fiction, 'Lights and Shadows of Scottish Life'; 'The Foresters'; and 'The Trials of Margaret Lyndsay,' which are marked by pathos and beauty of description, but are far from being faithful transcripts of human nature, and degenerate at times into mawkish sentimentality. A government pension of £300 per annum was bestowed on him in 1851, and the following year he resigned his professorship. There is an incomplete edition of his works by Ferrier (12 vols., 1855-8), and a separate edition of the 'Noctes' by R. S. Mackenzie (5 vols., 1866). Consult 'Mémoire' by his daughter, Mrs. Gordon (1862); Saintsbury, 'Essays in English Literature' (1890); Mrs. Oliphant, 'William Blackwood and His Sons' (1897); Douglas, 'The Blackwood Group' (1897).

Wilson, John, Scottish missionary: b. Lauder, Scotland, 11 Dec. 1804; d. Bombay, India, 1 Dec. 1875. He was educated at the University of Edinburgh, went to Bombay in the service of the Scottish Missionary Society in 1828, and in 1835 transferred his labors to the mission work of the Free Church of Scotland. He established numerous schools; became vice-chancellor of the University of Bombay; contributed largely to the abolition of the practice of suttee; traveled all over India establishing missionary centres; and was universally honored and beloved by the natives, among whom he spent his life from the time he went among them with the exception of the years 1843-7. He founded in 1830 the 'Oriental Christian Spectator,' issued for 30 years, and was the pioneer of Christian periodicals in India. His linguistic ability was remarkable, and his contributions to literature included: 'The Parsi Religion' (1842); 'India Three Thousand Years Ago' (1857); 'Memoirs on the Cave-Temples of India' (1859); 'The Lands of the

WILSON

Bible Visited and Described' (1867); and 'Indian Caste' (1877). Consult George Smith, 'Life of Wilson' (1878).

Wilson, John Mackay, Scottish author: b. Tweedmouth 1804; d. Berwick-on-Tweed 2 Oct. 1835. He edited for several years the 'Berwick Advertiser' and was editor and principal author of the popular 'Tales of the Borders' (1835-40). The latest edition, revised and enlarged to 24 volumes, appeared in 1869.

Wilson, John Moulder, American military engineer: b. District of Columbia 8 Oct. 1837. He was graduated from West Point in 1860, received rank as lieutenant in 1861 and subsequently served in the Manassas, Peninsular, and Maryland campaigns. He was conspicuous for gallantry at Gaines's Mills and at Malvern Hill in 1862, and in 1863 was promoted captain, subsequently serving in the engineer corps. In 1865 he was brevetted colonel of volunteers and both lieutenant-colonel and colonel of regulars for gallantry at the capture of Spanish Fort in Mobile Harbor, and at Fort Blakely. After the war he was in charge of various important engineering works under the government and in 1886-9 was superintendent of public buildings and grounds in the District of Columbia. He directed the completion of the Washington Monument, the construction of the Army Medical Museum and Library, and other public buildings and memorials. He was appointed superintendent of the Naval Academy in 1889; in 1897 was appointed chief of engineers with rank of brigadier-general and was retired at his own request in 1901. In 1902 he was appointed to represent the army at the coronation of Edward VII.

Wilson, John Timothy, American organizer: b. Riceville, Tenn., 29 Jan. 1861. He worked on a farm until 17, filled several positions on a railroad and in 1888 began the organization of the International Brotherhood of Maintenance-of-Way Employees, of which he has been president since its start. It has nearly 100,000 members, has secured increased wages, shorter hours, and improved working conditions, with but one strike on its records. Wilson published 'The Calcium Light,' an account of this strike (on the Canadian Pacific, 1901).

Wilson, Richard, Welsh landscape-painter: b. Penegoes, Montgomeryshire, 1714; d. Llanberis, Carnarvonshire, May 1782. He went to London, and studied portrait-painting with Thomas Wright. He then practised his profession in London, at length went to Italy, and at Venice, Zuccarelli, the artist, persuaded him to devote himself wholly to landscape. After staying some time at Rome and Naples, where he acquired great reputation, he returned to England in 1756, and settled in the metropolis. He had for a while much employment; but was at length doomed to undergo indifference and neglect, and was glad to obtain the office of librarian to the Royal Academy in 1776. His taste was exquisite, and whatever came from his easel bore the stamp of elegance and truth. Among his best works are the 'Niobe,' 'Ruins of the Villa of Mæcenas,' 'Phæthon,' 'Snowdon,' 'View of Rome from the Villa Madama.' Two of his works are to be seen in the New York Metropolitan Museum.

Wilson, Sir Robert Thomas, English soldier and author: b. London 17 Aug. 1777; d. there 9 May 1849. He was educated at the Westminster and Winchester schools, volunteered for the war in Flanders in 1793-4, and was a member of the staff during the Irish rebellion of 1798. He served in Holland in 1799 and in 1800 was engaged under Abercrombie in Egypt. He served under Lord Hutchinson on a secret mission to the allied armies on the Russian frontier in 1806-7, and in 1808-10 commanded a Lusitanian legion and later a Spanish brigade in Spain and Portugal. He sat in Parliament for Southwark in 1818-31 and for his espousal of the cause of Queen Caroline he was dismissed from the army in 1821, but subsequently reinstated. He received promotion to full rank as general in 1841 and in 1842-9 was governor of Gibraltar. He was author of several works on military subjects, several of which were not published until after his death, when they were edited by his son-in-law, Rev. Herbert Randolph. They include: 'History of the British Expedition to Egypt' (1802); 'Sketches of the Campaigns in Poland' (1810); 'Military and Political Power of Russia' (1817); 'Narrative of Events During the Invasion of Russia' (1860); 'Diary' (1861); etc. Consult Randolph, 'Life of Gen. Sir Robert Thomas Wilson' (1863).

Wilson, Rufus Rockwell, American author: b. Troy, Pa., 14 March 1865. He was engaged in journalism in Pittsburg, Washington, and New York in 1883-91, and has published: 'Rambles in Colonial Byways' (1900); 'Washington—The Capital City' (1901); 'New York, Old and New' (1902); 'Lincoln in Caricature' (1903); etc.

Wilson, Theodore Delevan, American naval constructor: b. Brooklyn, N. Y., 11 May 1840; d. Boston, Mass., 29 June 1896. He served an apprenticeship in the Brooklyn navy yard and in 1861 was appointed a carpenter in the construction department of the navy. In 1866 he was appointed assistant naval constructor; subsequently he was engaged in the navy yards at Pensacola, Philadelphia, and Washington. In 1869-73 he was instructor in naval architecture and shipbuilding at the Naval Academy, Annapolis, Md., and in the last mentioned year was promoted to be naval constructor. He was chief constructor of the navy from 1882-93, when he resigned because of failing health, and was granted a two years' leave of absence, resuming his duties at the Boston navy yard in 1895. He was an honorary member of the Institute of Naval Architects of England, the first American to be elected to that body. He patented in 1870 the "air-ports," since generally adopted in the navy and in merchant-ships, and in 1880 patented a bolt extractor which has since come into general use. During his service he designed the battleship Maine, the cruisers Boston, Chicago, and San Francisco, the gunboats Concord, Bennington, Petrel, and other vessels. He wrote 'Shipbuilding, Theoretical and Practical' (1873), which was adopted as a text-book at the Naval Academy.

Wilson, Thomas, English Anglican prelate: b. Burton, England, 20 Sept. 1663; d. Isle of Man 7 March 1755. He was educated at Trinity College, Dublin, and was curate of Newchurch Kenyon, 1686-92. He then became

WILSON

chaplain to the Earl of Derby, who appointed him bishop of Sodor and Man in 1697. His episcopate lasted 58 years and is noted for his strict insistence upon his privileges as head of the ecclesiastical court. This occasioned frequent disputes with the governor of the Isle of Man and he was at one time imprisoned for two months. He was the author of 'Principles and Duties of Christianity' (1707), commonly called the Manx Catechism—the first book printed in the native tongue; 'The Knowledge and Practice of Christianity Made Easy to the Meanest Capacities' (1775); 'Short and Plain Instructions for the Better Understanding of the Lord's Supper' (1736); 'Sacra privata, Private Meditations, Devotions, and Prayers' (1800); 'Parochialia, or Instructions for the Clergy' (1788); 'Maxims of Piety and Christianity' (1789). He instituted a Manx translation of the Bible, completed 1772–5. Consult 'Lives' by Crutwell (1781); Keble (1847).

Wilson, William, American poet: b. Perthshire, Scotland, 25 Dec. 1801; d. Poughkeepsie, N. Y., 25 Aug. 1860. He edited the Dundee 'Review,' 1821–3, did newspaper work in Edinburgh, where he was a friend of the brothers Chambers, and coming to this country in 1833, established himself at Poughkeepsie as bookseller and publisher. His 'Poems,' edited by Lossing, appeared in 1870 and revised and enlarged editions in 1875 and 1884.

Wilson, William Dexter, American philosopher and Episcopal clergyman: b. Stoddard, N. H., 28 Feb. 1816; d. Syracuse, N. Y., 30 July 1900. He was graduated from the Harvard Divinity School in 1838 and took orders in the Episcopal ministry in 1842. In 1850–68 he occupied the chair of philosophy at Hobart College, resigning in the last mentioned year to become registrar and professor of moral philosophy at Cornell University. He was made professor emeritus there in 1886 and during the last years of his life was dean of Saint Andrew's Seminary at Syracuse. He published: 'Introduction to the Study of the History of Philosophy' (1872); 'First Principles of Political Economy' (1875); 'The Foundations of Religious Belief' (1883); 'Theories of Knowledge Historically Considered' (1889); etc.

Wilson, Sir William James Erasmus, English surgeon and philanthropist: b. London 25 Nov. 1809; d. Westgate-on-Sea, Kent, 8 Aug. 1884. He went through a course of hospital practice in Paris, where he became known to Cuvier and Geoffroy de St. Hilaire, later attached himself to the Aldersgate School of Medicine, and was engaged in 1831 as assistant to Dr. Quain, professor of anatomy in University College. His first work, 'Practical and Surgical Anatomy,' was published in 1838, followed in 1840 by the 'Anatomist's Vade Mecum.' About this time he determined to devote himself to dermatology, and soon became the acknowledged authority in that hitherto obscure branch of medical science. He became fellow of the Royal College of Surgeons in 1843, and president in 1871. In 1845 he was elected a fellow of the Royal Society. By the time he had reached his 50th year he had amassed considerable wealth, and he then began a series of public and private acts of munificence, founding a professorship of dermatology in the College of

Surgeons, the chair of which he filled for nine years, contributing £7,000 to Epsom Medical College, restoring the ancient church of Swanscombe, Kent, founding a chair of pathology at Aberdeen, subscribing liberally to the Royal College of Music, and to the Margate Sea-bathing Infirmary. He devoted much attention to Egyptology, was president of the Egypt Exploration Fund, and furnished £10,000 for the transport of the obelisk known as "Cleopatra's Needle" from Alexandria to its present site on the Thames Embankment. In 1881 he was knighted. Besides many publications in his special science he published, 'Cleopatra's Needle, with Notes on Egypt and Egyptian Obelisks'; and 'The Egypt of the Past.'

Wilson, William Lyne, American educator and legislator: b. Jefferson County, Va., 3 May 1843; d. Lexington, Va., 17 Oct. 1900. He was graduated from Columbian College in 1860, and later studied at the University of Virginia. He served as a private in the Confederate army through the Civil War, and in 1865–71 was professor of ancient languages at Columbian College. He was meantime engaged in the study of law, in 1867 was admitted to the bar, and several years later began practising law in Charlestown, W. Va. He was elected president of the University of Virginia in September 1882 and in the same month was elected to Congress. In June 1883 he resigned his presidency of the university, but served continuously in Congress until 1894. He framed the Wilson Tariff Bill (see *TARIFF*), but disapproved of the amendments it received in the Senate. In 1895 was appointed postmaster-general by President Cleveland, and from 1897 until his death was president of Washington and Lee University.

Wilson, Woodrow, American educator and historian: b. Staunton, Va., 28 Dec. 1856. Graduated from Princeton in 1879 he studied law in the University of Virginia, and practised at Atlanta, Ga., in 1882–3. After special studies in history and politics at the Johns Hopkins University (1883–5), he was an associate-professor at Bryn Mawr in 1886–8, in 1888–90 professor of history and political economy in Wesleyan University, and in 1890 was appointed to the chair of jurisprudence and politics at Princeton. Upon the resignation of President F. L. Patton (q.v.) in 1902, he was elected president of the university, the first layman so chosen. He contributed largely to periodicals on administrative and political subjects, and took high position as a scholar and author by a series of works, including: 'Congressional Government: A Study in American Politics' (1885), which gained for him recognition on both sides of the Atlantic, and in England was taken as authoritative on American institutions; 'The State: Elements of Historical and Practical Politics' (1889), a standard book; 'Division and Reunion 1829–1889' (1893); 'An Old Master, and Other Political Essays' (1893); 'Mere Literature, and Other Essays' (1896); 'George Washington' (1896); and 'A History of the American People' (1902), a five-volume publication, in many respects the most satisfactory compendious narrative of the political history of the United States. He was also a contributor to 'The National Revenues' (1888), a volume of essays by American economists.

DR. WOODROW WILSON,
PRESIDENT OF PRINCETON UNIVERSITY.

WILSON — WILSON'S CREEK

Wilson, N. C., town, county-seat of Wilson County; on the Atlantic Coast Line Railroad; about 42 miles east by south of Raleigh. It is in an agricultural region in which the chief products are cotton and tobacco. The principal manufacturing establishments are cotton and lumber mills, carriage factories, foundries, machine shops, tobacco works, and flour mills. The town owns the electric light plant and the waterworks. The three banks have a combined capital of \$210,000. There are public and private schools for both races. Pop. (1890) 2,126; (1900) 3,525.

Wilson Bill, The, a tariff measure enacted by Congress in 1895, succeeding the McKinley Bill (q.v.) of 1890. The Wilson tariff bill was based on the cost of raw material rather than on the cost of production, and was passed in the interest of the manufacturer. By this bill wool was placed on the free list or was made free of duty.

Wilson College, a college for women, located at Chambersburg, Pa. It was established in 1870 under the auspices of the Presbyterian Church. The majority of the board of trustees are Presbyterians, and the college is under the special care of the Synod of Pennsylvania. The courses offered are a classical course leading to the degree of A.B., a musical course leading to the degree of bachelor of music, and an art course entitling the student to a diploma in art. Each course is four years in length; the work in all courses includes required and elective studies, the latter coming mostly in the junior and senior years. Bible study is required in all courses. History and theory of art and music are included among the regular electives of the classical course; and arrangements are made so that students can take technical art and music courses and at the same time do the full amount of work required for the A.B. degree. There are also preparatory, classical, art, and music courses. Gymnastic work is required for three years of the college course, and the outdoor sports of rowing, tennis, basketball, and hockey are encouraged. The students maintain three literary societies, one for the preparatory and younger students; membership in one of these societies is required. The college campus comprises 25 acres located in the suburbs of Chambersburg; the Conococheague flows through the grounds, affording opportunity for rowing and fishing. The buildings include Main Hall, Fletcher Hall, South College, Science Hall, the Dining Hall, the Gymnasium, Frank Thomson Music Hall, with a large auditorium, the infirmary, and Harmony Cottage. Tuition is free to ministers' daughters who live at the college. The library in 1904 contained 7,000 volumes; the students numbered 320, of whom 177 were in the classical course.

Wilson Law. See ORIGINAL PACKAGE.

Wilson's Creek, or Oak Hills, Battle of. After the battle of Carthage (q.v.) 5 July 1861, Col. Sigel retreated to Springfield. Gen. N. Lyon who, with 2,350 men, had left Boonville in pursuit of Gov. Jackson, was joined near Clinton, on the 7th, by Major S. D. Sturgis, with 2,500 men and pushing southward learned on the 9th that Gen. Jackson had defeated Sigel at Carthage and formed a junction with Gens. Sterling Price and Ben McCulloch, who were marching from the southwest, upon which he

made a rapid march to Springfield, to anticipate Confederate attack on that place. He arrived on the 13th, and, with Sigel's forces, his united command numbered about 6,200 men. He spent the latter part of July in drilling his troops and procuring supplies and sent many urgent but unavailing appeal to Frémont at Saint Louis for reinforcements. The Confederates under Price and McCulloch numbered over 8,000 men, poorly armed with shotguns and country rifles, and had followed Sigel as far as Cassville, about 50 miles from Springfield. Here reinforcements arrived, swelling their force to 11,000 men with 15 guns, and 31 July they advanced toward Springfield. Lyon heard of their advance on 1 August and marched out on the Cassville road to meet them, with about 6,000 men and 18 guns, hoping to attack the largest and most advanced force, drive it back on the others and strike them in detail. On the next day his advance met and had a lively encounter with Price's advance under Gen. Rains, at Dug Spring, and drove it back. After advancing several miles he returned to Springfield on the 5th and reported the condition of affairs to Frémont, that he was largely outnumbered and probably would be compelled to abandon Springfield and fall back to Saint Louis or into Kansas (see SPRINGFIELD). McCulloch had refused to support Price in the affair at Dug Spring and now refused to advance unless he was acknowledged as in supreme command. Price consented to serve under him and at midnight of the 5th McCulloch advanced hoping to surprise Lyon, but finding that he had gone followed and on the 6th went into camp on Wilson's Creek within ten miles of Springfield. As the Confederates showed no disposition to advance from Wilson's Creek, Lyon, on the 8th, proposed to make a night march and attack them at daylight next morning, from which he was dissuaded, but it was agreed to march on the night of the 9th and attack the Confederate left at daybreak of the 10th. After this plan had been agreed on Col. Sigel persuaded Lyon to permit him with his brigade of two regiments, a six-gun battery, and two companies of cavalry to make a flank march around the Confederate right and attack from the south, while Lyon with the remainder of his force should attack on the north. Sigel, with his 1,200 men and six guns, moved four miles down the Cassville road, and making a long detour to the left, at daybreak was within a mile of the Confederate rear. Meanwhile Lyon had marched from Springfield and at 4 A.M. struck the advanced picket of Rains' Missouri command, which gave the alarm, the Confederates turned out of their camps and prepared for action and at 5.30 A.M. one of the most stubborn battles of the war began. The point selected by Lyon for his main attack was on the south side of Wilson's Creek and was held by Gen. Price with about 3,200 Missourians including Guibor's and Bledsoe's batteries, reinforced later by Churchill's regiment and Woodruff's battery, both from Arkansas. On Price's right, north of the creek, was McCulloch's brigade; on McCulloch's left and rear and on the same side of the creek was Pearce's Arkansas brigade, while in Price's rear, on the south side of the creek, were Churchill's regiment and the cavalry commands of Green and Major.

Gen. Lyon, with about 4,000 infantry and cavalry and the two batteries of Totten and

WILSON'S RAID

Dubois advanced more than a mile, driving in the Confederate skirmishers to the main line, which was posted on a wooded ridge perpendicular to the creek and to the Union line of march. He made an attack and the Confederates on the right were driven from the crest to the foot of the ridge. At the same time Capt. Plummer, with 300 regular infantry and 200 Home Guards, moving on the left and beyond the creek, upon entering a cornfield was attacked by the 3d Louisiana and other parts of McCulloch's brigade and after a fierce fight was checked. Dubois' battery opened upon these Confederates from across the creek and drove them back in some disorder and Plummer was withdrawn. It was now 8 o'clock, there was a temporary lull in Lyon's front, save by an effort of Price to turn his right, which was repulsed, and meanwhile Sigel had become engaged. Sigel had gained the Confederate rear and when he heard Lyon's musketry, he put his guns in position, drove Churchill, Major and Green from their camps, while they were at breakfast, crossed the creek and marching to the Springfield and Fayetteville road, formed across it at Sharp's Farm, the Confederates that had retired before him joining Price. McCulloch now sent a battalion of mounted Missourians and some Texans, and a part of the 3d Louisiana against Sigel. Bledsoe's battery opened on his front, Reid's battery joined in the enfilading fire, the Louisiana men charged and captured five of his guns, and he was driven from the field, pursued the way he had come by the Texas and Missouri cavalry, and his command broken and scattered, Sigel himself narrowly escaping capture. Col. Salomon, with 450 men, made a wide detour and reached Springfield in fair shape, but Sigel's command took no further part in the battle. The contest had been renewed by Price, and the Confederates now turned their entire attention to Lyon, and McCulloch's brigade and Pearce's Arkansas brigade were sent to reinforce Price. Lyon ordered up every available man to meet the shock he saw impending, and about this time Price made a determined advance in two lines which nearly covered Lyon's entire front. For an hour the fighting was desperate, with varying success, till at last the Confederate effort was exhausted and there was another lull. Nothing had been heard from Sigel, and Pearce's Arkansas brigade was coming up to the support of Price's right, and Lyon made disposition to meet the new danger. His horse had been killed under him, and himself wounded and stunned, but recovering and again mounted, he swung his hat and led a charge against the Confederate right, which was met by a severe fire, the charge was not checked and the enemy were driven back, but Lyon received a wound near the heart, endeavored to dismount from his horse, and as he fell into the arms of his orderly, almost immediately expired. Major Sturgis succeeded to the command and the contest was continued for a half hour, when the Confederates gave way a short distance to re-form and make another effort. This was soon made and resulted in a disastrous repulse, and the battle was ended. Taking advantage of this last repulse, Sturgis, against the advice of some of his officers, ordered a retreat and withdrew through the dense undergrowth of the woods in which the battle mainly was fought, and the Confederates, as one of their officers writes,

"were glad to see him go" and did not pursue. Lyon's dead body was left on the field; it was subsequently delivered by the Confederates and taken to Springfield where it was buried. When Sturgis reached Springfield he yielded the command to Sigel, who had arrived there before him. Next morning Sigel marched for Rolla, over 100 miles distant. McCulloch refused to pursue Sturgis from the field of battle, and Price, resuming command of the Missouri troops, on the next day took possession of Springfield. The Union force in the battle numbered about 5,400 officers and men. The Confederates had over 10,000 armed men on the field, but 3,000 of them took little or no part in the fight. As officially reported the Union loss was 223 killed, 721 wounded, and 291 missing; the Confederate loss 265 killed, 800 wounded, and 30 missing. The Union reports were not full and a revised statement gives 258 killed, 873 wounded, and 186 missing, an aggregate of 1,317. Col. Snead, Price's adjutant general, places the Confederate loss at 279 killed and 951 wounded, an aggregate of 1,230.

Consult: 'Official Records,' Vol. III.; The Century Company's 'Battles and Leaders of the Civil War,' Vol. I.; Snead, 'The Fight for Missouri.'

E. A. CARMAN.

Wilson's Raid from Chickasaw to Selma, Alabama, and Macon, Georgia. After the defeat of Hood's army at Nashville (q.v.) 15-16 Dec. 1864, Gen. James H. Wilson proceeded to complete the organization of a cavalry corps, with which it was proposed to overrun the South, and destroy its railroads and manufacturing centres. Early in March 1865, 27,000 men had been gathered and organized, nearly all well mounted, finely equipped and brought to a high state of efficiency. Some of this force was detached for other duty. Wilson, who had been encamped along the north bank of the Tennessee River from Gravelly Springs to Waterloo Landing, crossed the river on 18 March and started from Chickasaw and Waterloo, on the 22d for a march through northern Alabama, his first objective point being Selma, a great manufacturing place. He had the three divisions of Generals Emory Upton, Eli Long, and E. M. McCook, aggregating 12,500 mounted men with 24 guns. He had also 1,500 dismounted men, who were to act as train guards till they could be mounted from captured horses. Gen. Sherman says it was the largest, most efficient and most powerful body of horse that had ever come under his command. It was not excelled by any body of cavalry in the army. Accompanying it was a small canvas pontoon train of 30 boats, hauled by 50 six-mule teams, and a supply train of 250 wagons which were sent back to the Tennessee as fast as they were unloaded. This train carried 45 days' rations of coffee, 20 of sugar, 15 of salt and 80 rounds of ammunition. Each man carried five days' light rations, with 100 rounds of ammunition, and five days' rations of hard bread and ten of sugar and salt were carried on pack animals. As the entire country near the Tennessee was nearly destitute of forage it was necessary to scatter the troops over a wide extent and march as rapidly as circumstances would permit. This, Wilson says, was rendered safe by the fact that Gen. Forrest's Confederate forces were at the time much scattered, some near West Point, Miss., 150

WILSON'S RAID

miles southwest of Eastport, while Roddey's forces occupied Montevallo, on the Alabama and Tennessee Railroad, nearly the same distance to the southeast. By starting on diverging roads the enemy was left in doubt as to the real object and compelled to watch equally Columbus, Tuscaloosa, and Selma. Therefore the divisions marched on different roads, but the objective point of each was Selma, distant 180 miles, and the average march of each division to reach it was 250 miles. The command moved southward in three columns and on the 26th reunited at Jasper, about 80 miles southeast of Tusculumbia, from which it crossed the two forks of the Black Warrior, and pushed for Montevallo, a centre of iron manufacture. Gen. Croxton's brigade was detached to move on Tuscaloosa, to burn bridges, factories and public stores, and rejoin the command in the vicinity of Selma. Iron-works and rolling mills were destroyed near Elyton and 31 March, after passing Montevallo a mile, Upton encountered Roddey, who disputed the road to Randolph. After two brisk engagements Roddey was driven back, losing 100 men, and was pursued by Upton, who occupied Randolph at dark. Here a courier was captured, with despatches to Forrest, showing that several columns were moving to join Forrest for the defense of Selma, and detachments were sent to check them. McCook was left at Randolph to guard the trains and rear, while Wilson, with the divisions of Long and Upton, on 1 April, rode straight for Selma, encountered and brushed away several detachments of Forrest's cavalry and at Ebenezer Church came upon Forrest in position, with the brigades of Roddey, Crossland and D. Adams, about 1,500 men, covering the two roads from Randolph by which Wilson had marched. Long's division and Alexander's brigade of Upton's attacked and carried the position in less than an hour, the Confederates retreating in great disorder toward Selma despite all of Forrest's efforts to rally them. At night the whole command bivouacked about Plantersville, 19 miles from Selma, after almost constant fighting during the day of 24 miles, during which Wilson had captured 3 guns and over 200 prisoners. Early in the day McCook, with Col. La Grange's brigade, had been ordered to march rapidly to Centerville, 40 miles distant, to seize and hold the bridge over the Cahaba, and to fall upon Jackson's Confederate cavalry division, which had thrust itself between the main body and Croxton. At daylight 2 April Wilson resumed his march and by rapid movement, without opposition, the troops were in sight of Selma and mostly in position by 4 P.M. The city had been sufficiently fortified, as was believed, against any possible cavalry attack. The works contained 24 bastions and a number of strong redans, with deep ditches, and an interior line of four detached forts. They were of semicircular form, nearly three miles in extent, with both flanks resting on the Alabama River, above and below the city. They mounted 32 guns and were held by Forrest, with about 4,000 veteran cavalry and some 2,000 Alabama militia, home guards and citizens, mostly old men and young boys. Wilson had obtained accurate plans of the works and of the ground in front of them. During the day these sketches were shown to all his general officers and the plan of attack explained, from

which it resulted that upon reaching the vicinity of the works, the various brigades went quickly into position, with great precision. At a given signal Long's division was to lead in the assault, supported by Upton, but before the signal had been given Long had become engaged and without waiting he ordered the charge, and in the gathering darkness his men went forward, under a severe fire of artillery and musketry, scaled the works and after a hand to hand encounter drove the Confederates from them and took many prisoners. Some of Upton's men joined in the fight. Gens. Forrest, Armstrong, Roddey and Adams escaped, with a number of men, under cover of darkness. A portion of Upton's division pursued on the Burnsville road until long after midnight, capturing 4 guns and many prisoners. Wilson had engaged and in support, 8,000 men. His loss was 44 killed, 277 wounded, and 7 missing. Forrest's loss in killed and wounded was less. It was one of the most remarkable feats ever accomplished by cavalry, and its result was the capture of 2,700 prisoners, many colors, nearly 2,000 horses, 104 field and siege guns and an immense quantity of ammunition. Wilson destroyed the arsenal, with 44 buildings, covering 13 acres, filled with machinery and munitions, powder works, 3 gun foundries, 3 rolling mills, and several machine shops, and large accumulations of quartermaster and commissary stores. On the 3d Upton's division was sent from Selma to open communication with McCook and Croxton, west of the Cahaba. McCook had found Jackson's cavalry between himself and Croxton, and after skirmishing with it at Scottsville, had retired east of the Cahaba. Nothing was heard of Croxton and Upton, and McCook returned to Selma, on the 6th. Croxton made a wide detour to the west and south of Tuscaloosa, and then northward and eastward across Alabama into Georgia before rejoining the corps. Preparations were now made to march on Montgomery. It was necessary to prepare 900 feet of bridging to cross the Alabama River, which was running high, horses enough had been captured to mount the whole command, supplies in the country were abundant, and on the 9th the entire command, except Croxton's brigade, started for Georgia by way of Montgomery. When the advance, which had not been strongly resisted, was near Montgomery, on the 12th, the mayor surrendered the city, Adams, who was in command having retreated, after burning 90,000 bales of cotton. With bands playing and colors flying the column marched through the city and encamped. Here five guns, a large quantity of stores, small arms and cotton were destroyed, also five steamboats loaded with military supplies. On the 14th the command moved with the greatest celerity to secure the crossings of the Chattahoochee at Columbus, on the direct road to Macon, and West Point, further up the river. On the afternoon of the 16th Upton's division, in the advance on the Columbus road, struck Buford's cavalry pickets and drove them rapidly through Girard to the lower bridge over the Chattahoochee. The bridge was fired by the Confederates before it could be seized, and it was then decided to make a night attack upon the central bridge, one of the three that crossed the river at this point. Three hundred men of the 3d Iowa cavalry, properly supported, were

WILTON—WILTS

selected to make the attack. The lines were quietly formed and moved up to within range of the intrenchments covering the bridge and at a signal the attack began at 9 P.M.; the troops opened a rattling fire from their Spencer rifles, which was replied to by a storm of canister from 27 guns, but the Iowa men went over the works at many points and all rushed for the bridge. At the same time the Confederates tried to escape by the bridge, which was so crowded with the men of both forces that the Confederates holding the works at the east end of the bridge and commanding it with two guns, were restrained from firing and the Union forces made a rush upon them and gained possession, and Columbus was taken. Wilson's loss was 6 killed and 24 wounded. He captured 1,200 prisoners, nearly half of the militia that had defended the place under command of Gens. Howell Cobb and Robert Toombs. Columbus was one of the great manufacturing centres of the Confederacy, and its capture resulted in the destruction of a great quantity of war material, 63 guns, the ram Jackson, mounting 6 guns; 125,000 bales of cotton, 15 locomotives, 250, cars, a navy yard and armory, 2 rolling mills, powder magazines and an arsenal, with a great quantity of machinery, 2 iron-works, 3 foundries, and 10 mills and factories turning out war material. The Confederates abandoned and burned the gunboat Chattahoochee 12 miles below Columbus. On the same day that Wilson captured Columbus, La Grange's brigade captured West Point. La Grange had been detached at Tuskegee and marching northeast, after some sharp skirmishing, appeared before West Point about 10 A.M. of the 16th to find that the bridge spanning the river was defended by an earthwork, mounting 3 guns, and held by Gen. R. C. Tyler, with about 265 men. The fort was taken after a hard fight, during which La Grange's men bridged the ditch of the work, under fire. Gen. Tyler and 18 of his men were killed, 28 wounded, and 218 captured. La Grange had 7 killed and 29 wounded. The captures were 3 guns, 500 stands of small arms, 19 engines and 245 cars loaded with army supplies. After destroying the bridges, railway equipment and stores, La Grange moved toward Macon. With the main column Wilson also marched for the same place on the 18th and when nearing the city, on the 20th his advance was met by a communication from Gen. Beauregard, with information of a truce between Gens. Johnston and Sherman. Before the communication could reach Wilson, who was marching near the rear of his column, his advance had dashed into Macon and received the surrender of Gens. G. W. Smith, Howell Cobb and other prominent officers, and these, with the garrison, were held as prisoners of war. Here Wilson heard of the surrender of Gen. Lee, and next day, 21 April, he received a despatch from Gen. Sherman, to suspend hostilities until notified of the result of the negotiations then pending between Sherman and Johnston. The surrender of Macon included four generals, 3,500 men, 5 colors, 60 guns, a large number of small arms, and great quantities of military stores and supplies.

Croxtan, who had been detached from McCook's division at Elyton, on 27 March, rejoined the corps at Macon 1 May. He had captured Tuscaloosa and advanced as far as Bridgeville,

then returned to Tuscaloosa and Jasper, thence his line of march was 100 miles north of that pursued by Wilson, and on the way through Alabama he had a sharp engagement at Blue Mountain, near Talladega. He marched 653 miles, most of the time through a mountainous country, so destitute of supplies that his command could be subsisted and foraged only by the greatest efforts. Swimming four rivers, destroying five large iron-works—the last in the cotton States—three factories, numerous mills, immense quantities of supplies, capturing four guns and several hundred small arms, and near 300 prisoners, he rejoined the corps, with men and horses in fine condition. He lost in all 172 officers and men. The closing act of Wilson's campaign was the capture of Jefferson Davis by regiments from his command.

In the campaign Wilson had marched 525 miles, captured five fortified cities, 288 guns, 6,820 prisoners, and 23 colors. He subsequently paroled over 59,000 officers and men of the armies of Lee, Johnston, and Beauregard, and had destroyed a vast amount of property of every kind. He lost 99 killed, 598 wounded, and 28 missing, an aggregate of 725.

He had conducted the most notable cavalry movement of the War, none other equaled it in skilful planning, bold and successful execution. Consult: 'Official Records,' Vol. XLIX.; The Century Company's 'Battles and Leaders of the Civil War,' Vol. IV.; Cox, 'The March to the Sea'; Piatt, 'Life of Gen. Geo. H. Thomas'; Boynton, 'Gen. Geo. H. Thomas at Nashville.'

E. A. CARMAN.

Wil'ton, Joseph, English sculptor: b. London 17 July 1722; d. there 25 Nov. 1803. He studied in Paris and in Rome, and while at Rome in 1750 won the gold medal awarded for sculpture by Benedict XIV. on the occasion of his jubilee. He returned to England in 1755 and in 1758 became director of the art gallery of the Duke of Richmond. He was one of the founders of the National Academy and one of its first exhibitors. His busts and monuments were in much demand, among the former being those of Bacon, Cromwell, Isaac Newton, Chesterfield, Chatham and other prominent characters. From 1790 until his death he was keeper of the National Academy.

Wilton, Maine, town in Franklin County; on the Maine Central Railroad; about eight miles southwest of Farmington. It was settled in 1789 and in 1803 was incorporated. It has lumber mills, trunk and carriage factories, creameries, woolen mills, and agricultural implement works. The educational institutions are Wilton Academy, public schools, and a school library. Pop. (1890) 1,622; (1900) 1,647.

Wilton Carpet, a variety of carpet made similar to Brussels, excepting that the wire is flattened instead of being round, and has a groove along the upper surface, which acts as a director for the knife by which the loops are cut and the wire liberated.

Wilts, or **Wilt'shire**, England, a southwestern county bounded on the north and northwest by the county of Gloucester, on the west by Somerset, on the south by Dorset and Hants, on the east by Hants and Berks; area 1,350 square miles. Capital, Salisbury. The north is principally a fertile flat, with scarcely any per-

WIMAN — WINATSHIPUM INDIANS

ceptible slope, except on the frontier where it begins to rise in the direction of the Cotswold Hills, and near the centre, where it is broken by a ridge of downs; the south, though presenting at a distance the appearance of an almost uninterrupted plain, has an undulating surface, broken by downs and intersected by some fertile and well-watered valleys. In this south division is Salisbury Plain, an elevated plateau, covered with a scanty herbage. On the plain are the megalithic remains of Stonehenge, situated about nine miles north of Salisbury, and those of Avebury, about five miles west of Marlborough. The chief rivers are the Bristol Avon, the Salisbury Avon, and its tributaries Bourne, Wily, and Nadder. Though the arable land is of considerable extent, the larger proportion of the surface is kept in pasture, devoted chiefly in the south division to the rearing of sheep, and in the north to cattle-grazing and the dairy. Wiltshire bacon and cheese are famous. The manufactures comprise woolen goods, for which the principal localities are Wilton, famous particularly for carpets, Bradford, Trowbridge, Westbury, etc.; excellent cutlery and steel goods at Salisbury, ropes and sacking at Marlborough, iron founding at Devizes. Pop. (1901) 271,372.

Wim'an, Erastus, American mercantile agent: b. Churchville, Ontario, 21 April 1834; d. Saint George, S. I., 9 Feb. 1904. He entered the mercantile agency service in 1858 and in 1867 removed to New York, where he became interested in rapid transit schemes for Staten Island. He increased the number of steamboat trips between that island and New York from 15 to 65 a day, built the Arthur Kill bridge, and in 1902 secured congressional authority for the construction of a tunnel under New York Bay connecting New York, Long Island, and Staten Island. His later years were clouded by financial reverses and the frustration of his extensive plans for rapid transit. He wrote 'Chances of Success' (1893).

Wimbledon, wim'bl-dôn, England, a town of Surrey, southwest of London, of which it is practically a suburb, at the northeast extremity of the common of same name, which until 1889 was well known in connection with the shooting competitions of the National Rifle Association. It has a free library, almshouses, three hospitals, and many fine residences, being a favorite residential locality. The common has an area of about 1,000 acres. Pop. (1901) 41,604.

Wimborne, wim'bërn, or **Wimborne Minster**, England, a market-town of Dorsetshire, on the Wimar Allen River, near its confluence with the Stour, about seven miles northwest of Bournemouth. It is of historical interest in connection with its fine cruciform minster, the collegiate church founded by Edward the Confessor which succeeded the convent established by Saint Cuthburh, King Ine's sister, in 705. The minster exhibits various styles of transitional architecture from the Norman onward, has a central and a west tower, and contains several interesting features, including the tomb of Ethelred I., and a mediæval chain-library, one of the few in existence where the books are chained to the shelves. The grammar school in the town was founded in 1496. Pop. (1901) 3,696. Consult: Yeatman, 'Wimborne Minster'

(1878); Perkins, 'Wimborne Minster and Christ Church Priory' (1899).

Wimodausis, The, a benevolent secret society, composed exclusively of the wives, mothers, unmarried daughters and unmarried sisters of Master Masons. It originated in Pittsburgh, Pa., in 1895. The object of the society is: "To promote friendship and a kindly interest in the welfare of the members, and to stimulate intellectual activity by an interchange of thought on all subjects which will tend to the mutual advancement of the wives, mothers, daughters, and sisters of Master Masons."

Wim'ple, or Wimpel, a covering of silk or linen for the neck, chin, and sides of the face, worn usually out of doors. It is still retained as a conventual dress for nuns.

Winamac, win'a-māk, Ind., county-seat of Pulaski County; on the Tippecanoe River, and on the Pittsburg, Cincinnati & Chicago Railroad; about 90 miles southeast of Chicago and 23 miles northwest of Logansport. It has considerable trade; the principal shipments are farm and dairy products. The principal public buildings are the court-house, four churches, and the public and parish schools. The two banks have a combined capital of \$50,000 and deposits (1903) \$149,650. Pop. (1890) 1,215; (1900) 1,684.

Winan'dermere. See WINDERMERE.

Winans, Ross, American inventor: b. Vernon, N. J., October 1796; d. Baltimore, Md., 11 April 1877. He went to England to examine English railroad systems in the interest of the Baltimore & Ohio Railroad; and after his return built the first locomotive used on that railroad. He also invented the camel-back locomotive and the eight-wheeled car, and established in Baltimore some of the largest machine shops in the United States. He was active in political matters prior to the Civil War and in 1861 was elected to the extra session of the Maryland legislature, but was imprisoned in Fort McHenry. He was author of several pamphlets on religious subjects and also of 'One Religion, Many Creeds' (1870).

Winans, Thomas DeKay, American engineer, son of Ross Winans (q.v.): b. Vernon, N. J., 6 Dec. 1820; d. Newport, R. I., 11 June 1878. He was taken into partnership by his father on coming of age, and was sent by him in company with his brother William to make contracts with the Russian government for furnishing and managing the equipment of a railroad between Moscow and Saint Petersburg. With Andrew M. Bostwick and Joseph Harrison he entered into a contract for \$3,000,000, and afterward was engaged in other lucrative contracts with Russia. Upon his return to the United States he became interested in invention, and with his father and brother invented a system of steam navigation known as the "cigar-ship"; a tubular adjustment for the feeding of young trout; and various other mechanical devices.

Winatshipum Indians, a small tribe of the Salishan stock of North American Indians, also known as Piskwaus or Pisquouse, residing on Wenatchee River (whence the name of the tribe) and the north branch of Yakima River in Kittitas County, Washington. They took part in the Yakima treaty of 1855, but do not live

WINCHELL — WINCHESTER

on the reservation. There are six smaller tribes or bands connected with them and speaking the same language.

Win'chell, Alexander, American geologist: b. North East, Dutchess County, N. Y., 31 Dec. 1824; d. Ann Arbor, Mich., 19 Feb. 1891. He was graduated from Wesleyan University, Middletown, Conn., in 1847, became professor of physics and civil engineering at the University of Michigan in 1853 and of botany and geology there in 1855. He served as State geologist of Michigan 1859-62, professor of geology in the Kentucky University 1866-9, director of the Michigan Geological Survey 1869-71, and chancellor of Syracuse University 1872-4. From 1879 till his death he was professor of geology and palaeontology in the University of Michigan. He lectured extensively and published 'Sketches of Creation' (1870); 'Geological Chart' (1870); 'The Doctrine of Evolution' (1874); 'Science and Religion' (1877); 'Prædamites' (1880); 'Sparks from a Geologist's Hammer' (1881); 'World-Life' (1883); 'Geological Studies' (1886); 'Walks and Talks in the Geological Field' (1886).

Win'chendon, Mass., town in Worcester County; on the Miller River, and on the Boston & Albany and Boston & Maine (Fitchburg Division) R.R.'s; 35 miles north-northwest of Worcester. It was settled in 1752, and incorporated as a town in 1764; the town includes the villages of Winchendon, Waterville, and Winchendon Springs. It is principally a manufacturing town; the chief manufactures are wooden-ware, wood-working machinery, toys, and cotton goods; there is a national bank with a capital of \$200,000, and a savings bank. It contains the New England Home for Orphan and Destitute Children; and has several elementary schools, and the Murdock High School established in 1885 with a school library of 1,200 volumes (in 1904), and occupying a fine building valued at \$100,000; there is also a public library. The town owns and operates the system of water-works. Pop. (1890) 4,390; (1900) 5,001.

Win'chester, England, an ancient city, capital of Hampshire, situated on the right bank of the Itchen, 11 miles north of Southampton. The most important edifice is the cathedral; the oldest parts date from the 11th century, but the greater part of the main building was erected at various times from the 13th to the 16th century, William of Wykeham (1324-1404) having an important share in the work. It has a central tower without a spire and no other towers; length from east to west, 545 feet, width of the transepts 186 feet. The length of the nave, which has a beautiful interior, is 351 feet, height 86 feet; the transept contains several beautiful chapels and altars. Numerous monuments include the tombs of William Rufus, of Edmund, son of King Alfred, of William of Wykeham, Cardinal Beaufort, and of Izaak Walton; the shrine of Saint Swithun; etc. Other notable edifices and establishments are St. Mary's College (Winchester College or School, one of the great English public schools), founded by William of Wykeham in 1387, richly endowed and accommodated in a large range of buildings, of which the chapel, hall, and library are beautiful specimens of architecture; the guildhall; the old castle, which has been restored and assize courts built adjoining; a corn-ex-

change; barracks for 2,000 infantry; the hospital of St. Cross, founded in 1132, several other charitable institutions, a free library and museum, school of art, etc. The Abbey Gardens are very beautiful, and statues of Alfred the Great by Hamo Thornycroft, erected for the millenary of the king celebrated at Winchester in 1901, and of Queen Victoria by Alfred Gilbert, adorn the town. There are no manufactures or trade of any consequence. Winchester was called Caer-Gwent by the Britons, Venta Belgarum by the Romans—under whom it was an important place, with a Christian church—and Wintanceaster by the Saxons. It became the capital of England under the Saxons, when the country was united under the sway of Egbert, in the first half of the 9th century, and it retained this dignity till the middle of the 11th century, being a royal residence and place where parliaments met after this also. After the battle of Naseby it stood a week's siege by Cromwell. Pop. (1901) 20,919.

Winchester, Ill., city, county-seat of Scott County; on the Big Sandy Creek, and on the Chicago, Burlington & Quincy Railroad; 45 miles west-southwest of Springfield, Ill. It was first settled in 1830. It is in an agricultural region for which it is the shipping point; it contains grain elevators, flour mills, a meat-packing establishment, and a plow factory; there are two private banks. It has a public high school. Pop. (1890) 1,542; (1900) 1,711.

Winchester, Ind., city, county-seat of Randolph County; on the White River, and on the Grand Rapids & I. and the Cleveland, C. & St. L. R.R.'s; about 68 miles northeast of Indianapolis. It is in an agricultural region and in a natural-gas belt. It has flour and lumber mills, brick and tile works, machine shops, and a number of repair shops. The educational institutions are a high school, established in 1804, public graded schools, and the Randolph County Law Library. The three banks have a combined capital of \$140,000. Pop. (1890) 3,014; (1900) 3,705.

Winchester, Ky., town, county-seat of Clark County; on the Chesapeake & O. and the Louisville & N. R.R.'s; 18 miles southeast of Lexington. It is in an agricultural region, in the "Blue Grass" country. It has flour mills, spoke and rim factory, planing mills, and machine shops. The principal shipments are farm products and live-stock. The educational institutions are the Kentucky Wesleyan College (M. E. South), opened in 1866, and the public and private schools. The two banks have a combined capital of \$200,000. The town was incorporated in 1792. Pop. (1890) 4,861; (1900) 5,964.

Winchester, Mass., town in Middlesex County; on the Boston & Maine Railroad; about eight miles north by west of Boston. In 1638 the place was known as Waterfield, which, in 1640, was changed to Charlestown Village. In 1642 it was called Woburn, and in 1850 the present name was adopted. It has many places of great beauty, and it is a favorite residential suburb for Boston. It has manufactories for watch hands, leather and felt goods. There are machine shops and grist mills. A part of "Middlesex Falls," a State park, which has an area of 3,020 acres, is in this town. It has a State Aviary, and a Home for Aged People.

WINCHESTER

The educational institutions are a high school, established in 1850, graded public schools, and a public library which contains about 14,000 volumes. There are two banks. Pop. (1890) 4,861; (1900) 7,248. Consult Hurd, 'History of Middlesex County.'

Winchester, Tenn., town, county-seat of Franklin County; on the Elk River, and on the Nashville, Chattanooga & Saint Louis Railroad; about 80 miles south by east of Nashville. It is near the foot of the Cumberland Mountains, in an agricultural region. The town has considerable mining and lumbering interests. It is a favorite health resort. The chief industrial establishments are lumber and planing mills, wagon and carriage factories, wood-working factories, marble works, flour mills, and machine shops. It has one bank with a capital of \$75,000. Pop. (1890) 1,313; (1900) 1,338.

Winchester, Va., city, county-seat of Frederick County; on the Cumberland Valley and the Baltimore & O. R.R.'s; about 81 miles west by north of Washington, D. C. It is in an agricultural and stock-raising region and has considerable lumbering interests. It has flour and paper mills, lumber mills, woolen mills, glove factories, tanneries, and machine shops. The educational institutions are Valley Female College (M. E. South), opened in 1874; the Shenandoah Valley Academy, Fairfax Hall, the John Kerr High School (white), established in 1872; a high school for colored pupils, elementary schools for both races, and a public library. The principal public buildings are the court-house and the city-hall. There are National and Confederate cemeteries.

Fort Loudoun, built under Washington, and Washington's headquarters are of historic interest. Washington's occupancy of Winchester was in 1755, after Braddock's defeat. Washington was stationed here, in command of the colonial and British forces. During the Civil War, Winchester was for some time a battle centre. On 19 Oct. 1864 Sheridan left Winchester on his famous ride to Cedar Creek. See WINCHESTER, BATTLE OF.

Winchester, Battle of. See OPEQUON, BATTLE OF.

Winchester, Military Operations at and Near. Winchester was an important strategic point during the Civil War, and it is stated on good local authority that it was occupied or abandoned 68 times by the troops of both armies. It was held by the Confederates until 11 March 1862, when Gen. J. E. Johnston having retreated from Centreville and Manassas, Gen. "Stonewall" Jackson, under Johnston's orders, withdrew from the place and retired up the Shenandoah Valley, and the Union troops, under Gen. Banks, occupied it on the 12th. Gen. Shields, who had followed Jackson up the valley, with a division of Banks' command, fell back to Winchester and Jackson followed him as far as Kernstown (q.v.), four miles south of Winchester, where Shields attacked and defeated him on 23 March; Jackson again retreating up the valley, Banks following and finally taking up a fortified position at Strasburg. Jackson flanked Banks out of Strasburg by moving through Luray Valley and defeating Col. Kenly at Front Royal (q.v.) 23 May, and Banks retreated to Winchester closely pursued by Jackson.

Winchester, First Battle of.—Banks arrived in Winchester late on the 24th with about 8,000 men and 16 guns. Col. Donnelly's small brigade was put in position to cover the Front Royal and Millwood roads, and was supported by eight guns, judiciously placed on rising ground. Col. Gordon's brigade, on the right, held a low ridge running southwest from the town and west of the Valley turnpike, a little over half a mile from the suburbs. Its left rested on the turnpike and its right extended westward along the ascending ridge in front of Winchester. Skirmishers were thrown out in advance and guns were placed on either flank. Five companies of Michigan cavalry were held in reserve under cover of the ridge. Between Gordon and Donnelly was an interval of nearly a mile, which was filled by the principal part of Gen. Hatch's cavalry brigade and two guns. The line formed the arc of a circle, covering Winchester from the west around by the south to the east. Jackson confronted this position with 16,000 men and 48 guns, and with the main body lay close to Gordon, while Ewell, with two brigades which had marched directly from Cedarville on Winchester, bivouacked opposite Donnelly's position. Jackson's plan was to hold Gordon fast, throw Ewell upon Donnelly, and then move his main body around Gordon's right, and he expected to advance upon a disorganized and demoralized army. At dawn of the 25th Ewell advanced the 21st North Carolina and opened with his artillery, whose shells fell among Donnelly's men, as they were preparing coffee, and brought them to arms as they saw the Carolinians advancing in line across an open field upon the centre of the position crossing the Front Royal road. The North Carolina men met a severe front and flank fire from the stone fences, and as they fell back Capt. Best's guns threw canister into their disordered ranks and they left the field with a loss of 80 officers and men, including the two field officers with them. A Confederate officer says, "The slaughter was appalling and the survivors fled to the rear in the utmost confusion." Ewell now brought up two batteries, and an artillery duel ensued, which soon ceased as a heavy fog settled over the field. Ewell then made an unsuccessful attempt to turn Donnelly's right and then endeavored to turn his left and gain the Martinsburg road in his rear. The attempt was checked, Donnelly losing some ground, but at this moment he received an order to retreat, as Gordon had been driven from position and was in retreat through Winchester. Donnelly moved his three regiments and guns from the field in perfect order, under a heavy fire of shot and shell, and continued his retreat, keeping to the right of the Martinsburg road. He had made a successful resistance of over four hours against double his number, with trifling loss.

Jackson attacked Gordon's small brigade with six brigades, his attack beginning at daybreak, and being several times repulsed. Finally he got artillery in position and opened on Gordon's front and gradually worked his infantry toward the left. Then he moved two brigades around Gordon's right. Gordon detected the movement while it was in progress and changed position to meet it, pouring a destructive fire of musketry into the Confederate ranks, making great gaps in the line, without checking its advance; the gaps were closed and with almost perfect align-

WINCHESTER

ment the two brigades came on and flanking Gordon's two right regiments drove them back in some disorder. The five companies of Michigan cavalry were now brought up and as quickly swept away. At this juncture Jackson ordered forward his entire line of six brigades and Gordon ordered a retreat through Winchester, which was conducted in a manner to command Jackson's admiration. There was some confusion in the streets of the town, but once clear of it, Hatch's cavalry and the artillery covered the withdrawal, until the infantry was well on the Martinsburg pike. Jackson with his main body pursued five miles beyond Winchester and Banks continued his retreat to the Potomac, crossing it at Williamsport on the 26th. Banks' loss May 23-25, including Front Royal and the retreat from Strasburg to the Potomac, was 62 killed, 243 wounded, and 1,714 missing. Jackson's loss was 68 killed, 329 wounded and 3 missing. Jackson remained at and in the vicinity of Winchester until 31 May, when, his rear being threatened by the converging columns of Fremont from the west and McDowell from the east, he retreated up the valley and the Union troops reoccupied Winchester. Consult 'Official Records,' Vol. XII.; Allan, 'Jackson's Valley Campaign.'

During Lee's campaign against Pope the town was occupied by Gen. Julius White with a brigade of over 2,000 men. On the night of 2 Sept. 1862 White, under Gen. Halleck's order, spiked four heavy siege guns in the works and withdrew to Harper's Ferry; the Confederates occupying the place next day. The Confederates held the place in small force until 3 December, when, upon the advance of a Union column from Harper's Ferry, under Gen. Geary, they retired, and Geary occupied the town next day. Geary soon withdrew and the Confederates reoccupied and held the town until near the end of December, when it was again taken by Union troops under Gen. Milroy. Milroy fortified the place and occupied also Berryville and Romney, with outposts toward Strasburg and Front Royal. Harper's Ferry, Martinsburg, Williamsport and posts westward to Cumberland and New Creek were held by Union troops belonging to Gen. B. F. Kelley's command.

Winchester, Second Battle of.—When Gen. Lee began his preparations for the second invasion of Maryland, which culminated in the battle of Gettysburg, he turned his thoughts to the clearing of the Shenandoah Valley. At this time Winchester was held by Gen. Milroy, with the two brigades of Gen. W. L. Elliott and Col. Ely, numbering about 7,000 effective men. Col. McReynold's brigade of 1,800 men was at Berryville. The main works defending Winchester were on a ridge north of the town and consisted of two forts known as the "main fort" and the "Star fort," mounting four 20-pounder Parrotts and two 24-pounder howitzers. Surrounding these were smaller works connected by rifle-pits. The expressed object in holding the place was to observe and hold in check the enemy in the valley, and to secure the Baltimore & Ohio railroad against depredations. Milroy was expressly instructed to undertake no offensive operations in force. On 7 June Gen. Lee began his operations in the valley by ordering Gen. Imboden, in the upper valley, to make a demonstration with his cavalry brigade on Romney

in order to cover the movement against Winchester and prevent the Union troops at that place from being reinforced by Kelley's troops on the line of the Baltimore & Ohio railroad. Gen. Jenkins' cavalry brigade was ordered to join Ewell's infantry corps near Front Royal. Both Imboden and Jenkins were in position by the 10th, and on that day Ewell set out from near Culpeper Court House for Winchester by way of Gaines' Cross Roads, Chester Gap and Front Royal, to Cedarville, which was reached on the 12th. Here, next day, Ewell detached Rodes' division and Jenkins' cavalry brigade to move on Berryville and endeavor to capture McReynolds' brigade, but, warned by Milroy, McReynolds made good his retirement, with small loss, joined Milroy at Winchester on the night of the 13th, and was assigned to the Star fort, immediately north of the main work. On the same day Early's division marched on Winchester by Newtown and the Valley pike, while Edward Johnson's division moved upon the town by the direct road from Front Royal. The two divisions, driving in Milroy's outposts, were in position before Winchester on the evening of the 13th. For some days Milroy had felt the pressure from Confederate cavalry, but had no idea that Lee was threatening the valley until a prisoner taken in a skirmish on the Strasburg road, on the evening of the 13th, informed him that he was confronted by Ewell's corps and that Longstreet's was near. Fully recognizing the fact that an orderly withdrawal was impracticable, he resolved to act on the defensive, and, if not relieved, force his way through what might appear the weakest part of his lines. At night of the 13th Ewell ordered Early to attack the works on the north and west of the town next morning, while, as a diversion, Johnson demonstrated against the east and southeast. In the forenoon Johnson made his attack on the eastern side of the town, between the Millwood and Berryville roads, held by Col. Ely's brigade, and was repulsed by the 8th and 87th Pennsylvania, which charged Johnson's retreating troops, but were speedily driven back by fresh troops, and after some sharp fighting Johnson gained part of the town, but was quickly shelled out and made no further effort. West of the ridge on which the main forts were thrown up, and about 1,300 yards distant, is another parallel ridge, called Flint Ridge, where an isolated earthwork of slight strength had been thrown up to command the Pughtown and Romney roads. It was held by the 110th Ohio, a company of the 116th, and a regular battery, commanded by Lieut. Wallace F. Randolph, all under command of Col. J. W. Keifer. Early, leaving Gordon's brigade south of the town to engage Milroy's attention, moved with the remainder of his division to the left and west, then north, crossed the Romney road, and about 5 P.M., having gained Round Mountain, south of the Pughtown road, and put 20 guns in position, without being perceived, opened an unexpected fire on Keifer's work and soon silenced Randolph's battery, upon which Hays' brigade, in two lines, made a quick dash, and after a stubborn resistance carried the work, and captured the battery of six guns. Keifer, with a loss of over 40 men, withdrew under cover of the fire from the guns of the main works. This was followed by an artillery duel which was kept up until 8 P.M., during which Milroy with-

WINCHESTER

drew his detachments to his main works. Darkness ended the contest.

Milroy was now in a critical position. His cannon ammunition was nearly exhausted and he had but one day's rations for his men. At 9 p.m. he assembled his brigade commanders, and it was concluded to give up further effort to defend the place, to abandon all the artillery and wagons, and to force a way through the Confederate lines that night, taking with them only the horses, small arms and usual supply of ammunition. All the guns were spiked and the ammunition thrown into the cisterns. At 1 a.m. of the 15th Milroy, abandoning his sick and wounded, avoiding the town, moved silently through a ravine about a mile and struck the Martinsburg pike, which was followed cautiously, with many halts to close up the stragglers, for about three miles, when, about 3:30 a.m. Elliott's brigade, which was in the advance, was fired upon by Confederate skirmishers and it was soon ascertained that their main body was east of and very near the road. The retreat had been anticipated and intercepted. Under Ewell's order, Gen. Johnson had left one brigade to prevent Milroy from escaping toward the east, and moved with the remainder of his division by way of Jordan Springs to Stephenson's Depot, about five miles north of Winchester, to intercept the retreat in that direction. Just as Johnson's head of column reached the railroad, 200 yards from the Martinsburg pike, Milroy's men were heard coming down the road and Johnson formed his line on elevated ground in a woods east of the road and in a field south of and adjoining the woods. The greater part of his men were sheltered by a stone fence which bounded a railroad cut. As soon as Elliott took in the situation he formed line of battle with his three leading regiments to push back the Confederates and thus clear the way for the rest of the column to pass on toward Martinsburg. An hour's fight ensued with varying success, Johnson's right being forced back and his artillery silenced, but the left of his line held firm against all efforts to shake it. The main road being blocked, Milroy determined to try another, and directed the troops to fall back a short distance and turn to the right. Part of them did so, but the greater number filed to the left, leaving the Martinsburg road and taking that to Bath. The diverging columns could not be reunited. A part of the command, accompanied by Milroy, reached Harper's Ferry by way of Smithfield late in the afternoon. Those retreating on the Bath road made good their escape, crossed the Potomac at Hancock and rallied to the number of 2,700 at Bloody Run. The greater part of Ely's and McReynolds' brigades were captured. Johnson claims the capture of 2,300 men, 175 horses, and 11 colors. The capture of Winchester and defeat of Milroy gave the Confederates 28 guns, 300 loaded wagons, many horses, and 4,000 prisoners. The Union loss was 95 killed, 348 wounded, and 4,000 captured or missing. The Confederate loss was 47 killed, 219 wounded, and 3 missing. Consult: 'Official Records,' Vol. XXVII.; Doubleday, 'Chancellorsville and Gettysburg.'

On marching into Maryland Gen. Early left a small garrison at Winchester and after the return from Gettysburg Lee's army was encamped around the place until it fell back beyond

the Rappahannock. The town was not then reoccupied in force by Union troops, being only visited occasionally by small detachments from Harper's Ferry and Martinsburg. It was subject also to Confederate forays from the upper valley. In December 1863 Gen. Early was sent into the valley, and throughout the winter and early spring of 1864 kept his troops very active, occasionally making dashes into Winchester. On 29 Feb. 1864 Gen. Sigel was assigned to the command of the Union troops in the lower valley and soon thereafter Winchester was occupied as an outpost to Harper's Ferry and Martinsburg. Sigel was relieved by Gen. Hunter after the battle of New Market (q.v.), 15 May, and when Hunter was repulsed at Lynchburg and forced to retreat to the Kanawha Gen. Early moved down the valley, and driving everything out of it, encamped near Winchester, 3 July, preparatory to his attempt on Washington (q.v.). After his failure on Washington Early returned to the lower valley and being hard pressed from the east and north fell back toward Strasburg, at the same time sending Ramseur's division of infantry toward Stephenson's Depot, a few miles northeast of Winchester, to support his cavalry and check Gen. Averell's division of Union cavalry, advancing from Martinsburg. Averell defeated Ramseur at Stephenson's Depot (q.v.), 20 July, and followed him through Winchester. He was joined by Gen. Crook's division, on the 22d, Crook assuming command, and the two divisions of 11,000 men advanced to Kernstown on the 23d. Early returned, defeated Crook at the second battle of Kernstown (q.v.) 24 July, drove him through Winchester and across the Potomac, and reoccupied Winchester and Martinsburg. Early's successes called for a strong commander of the Union forces to oppose him, and Gen. Sheridan was selected. On 7 August when Sheridan assumed command, near Harper's Ferry, Early's army was concentrated west of the Opequon River, covering Winchester and Bunker Hill. Sheridan advanced from Halltown toward Winchester, on the morning of the 10th, and Early, abandoning Bunker Hill and Winchester, fell back to Strasburg to await reinforcements coming from Lee's army at Richmond. Sheridan followed to Cedar Creek on the 12th. Early's reinforcements arriving, Sheridan's infantry fell back to Winchester on the night of the 16th, the cavalry following next day. From Winchester Sheridan, on the 17th, fell back to Berryville, behind the Opequon, leaving his cavalry to cover the withdrawal. Wilson's cavalry division, Lowell's cavalry brigade, and Penrose's brigade of New Jersey infantry, 850 men, were ordered to cover the flank of the army in its march from Winchester to Berryville. The Jersey brigade was deployed along a small branch of the Opequon, south of and near Winchester, with dismounted cavalry on the flanks, the remainder of the cavalry massed near the town. Early had followed Sheridan from Cedar Creek and, in the afternoon of the 17th, his cavalry advance driving in the Union cavalry, was checked and held by the Jerseymen, until Wharton's division of infantry attacked their right, and Ramseur's their front, while Gordon's division advanced against the cavalry. Under this pressure the entire Union line gave way about dark and fell back to Summit Point. The Jersey brigade lost 97 killed and wounded and about 200 prisoners.

The cavalry had about 50 captured. Early again occupied Winchester and advanced to confront Sheridan at Halltown. For some days both parties were feeling each other's lines and suffering some losses, and 2 September, Gen. Averell, who had been guarding the crossings of the Potomac, south of Hancock, advanced through Martinsburg to near Bunker Hill, where he attacked and routed Gen. Lomax's cavalry division of two brigades, capturing 2 battle-flags, 55 prisoners, some wagons, and a herd of cattle, finally driving Lomax nearly into Winchester next day, but Averell, in turn, was driven back by Rodes' infantry division. On the 13th Gen. McIntosh, with five cavalry regiments and two guns, started from Sheridan's lines near Berryville, captured some prisoners, and on approaching Winchester caught sight of an infantry line and charged it, driving it to a piece of woods, which he surrounded, capturing the 8th South Carolina of Kershaw's division, with its battle-flag. The rest of Kershaw's division advanced and McIntosh fell back with his 143 prisoners. These minor encounters were followed on the 19th by the greatest battle fought at Winchester, which to distinguish it from other battles of Winchester is known as the battle of the Opequon (q.v.), in which Sheridan with 38,000 men defeated Early's 15,000 and drove him from Winchester up the valley, not again to return. From this to the close of the war Winchester remained in Union possession. See also SHENANDOAH VALLEY, MILITARY OPERATIONS IN.

E. A. CARMAN.

Winckelmann, vīnk'ēl-mān, **Johann Joachim**, German archaeologist and art historian: b. Stendal, Prussia, 9 Dec. 1717; d. Trieste, Austria, 8 June 1768. He studied theology at Halle, spent several years as private tutor and schoolmaster and in 1748 was appointed by Count Heinrich von Büнау secretary in his library at Rohnitz, near Dresden. In 1755 he joined the Roman Catholic Church, and through the efforts of the papal nuncio at Dresden was enabled to visit Rome. Here he became librarian to Cardinal Albani, an art connoisseur and collector, and gave the public his ideas on ancient art. The more important of his works are: 'Geschichte der Kunst des Alterthums' (1764); and 'Monumenti Antichi Inediti' (1767-8); with various sets of letters on the remains at Herculaneum and Pompeii. He was recognized as the leading authority in Europe in the field to which he had devoted himself. In 1768 he revisited Germany, but at Munich a longing for Italy so overmastered him that he determined to return. Going by way of Vienna, he was well received there, and was presented to the Empress Maria Theresa, who bestowed rich presents on him. At the beginning of June he departed for Trieste, where, for the sake of the gold medals and valuables in his possession, he was murdered by a fellow-traveler, named Arcangeli. The robber was interrupted, and fled without securing any booty, but was subsequently taken and executed. A collective edition of Winckelmann's works was published (1808-20) and another (1825-9). Winckelmann is considered by all authorities as the founder of modern scientific archaeology, and his conception of the beautiful elicited Lessing's 'Laokoon.' Consult: Justi, 'Winckelmann, sein Leben, seine Werke

und seine Zeitgenossen' (1866-72); John, 'Biographische Aufsätze' (1866); Vogel, in 'Allgemeine deutsche Biographie,' XLIII. (1898).

Wind, a current of air established at certain times and places within the body of the atmosphere at large, and flowing during periods longer or shorter in certain general directions; such currents being occasioned chiefly by differences of temperature at different times or localities, and by variations in the production and condensation of watery vapor. The portion of the surface of the globe over which any particular wind, permanent or occasional, may extend, is comparatively small, as is consequently the tract of the entire aerial ocean resting on that surface that is involved. At all times, also, there are parts of the atmosphere that are sensibly at rest or calm; and such apparently motionless tracts of air are sometimes of very great extent. For a statement of the physical properties of the air, see ATMOSPHERE; and in reference to the mechanical principles of equilibrium, mobility, and disturbance of a fluid mass circumstanced as is the air, see PNEUMATICS. The atmosphere is held to the earth only by gravity, and the action of this force does not interfere with its fluidity or elasticity, nor with the effect of any pressures acting at points within it; so that its parts have entire freedom of motion about or among each other, and it is in every part sensitive to the slightest disturbing forces. Since, however, the globe with its aerial envelope is to be regarded as moving in unresisting space, and since the friction of the earth's surface upon the lowest stratum of air, and of the strata successively one upon another, has sufficed to communicate to the entire body the earth's own velocity, it follows that the atmosphere, if it were left at rest within itself, must partake of the earth's movements as perfectly as if it were a solid part of that body. The simplest of the disturbances affecting the atmosphere are the movements of "atmospheric waves" of greater or less magnitude and duration, but of two sorts, the daily and the occasional or irregular, the occurrence of which is shown by certain periodical or rare, but gradual variations of barometric pressure. From the nature of the medium, these waves are, as compared with those of water, on a vast scale. The indications of the barometers at stations scattered over a large area of country show that these waves move singly, and indicate their breadth, and the direction and rate of advance; a generally increased or maximum pressure showing at a given time the presence of the crest, while at distances on either side of this a minimum pressure shows the margins or accompanying troughs of the wave. Of daily atmospheric waves, or tides, there are two: (1) that due to attraction of the sun and moon, and which in periods and character is therefore similar to the oceanic tides, but which, its maximum effect on the mercury column not exceeding $\frac{1}{10}$ of an inch, cannot be a cause adequate to produce winds; (2) the heat tide, or elevation of a crest of air along a meridional line following the sun at no great distance, while the cooling on the opposite side of the globe occasions the advance of a corresponding line of depression, this tide having therefore for its period a solar day, and within that period but a single crest, instead of two opposite ones. Beside these pe-

WIND-FLOWER—WIND INSTRUMENTS

riodic fluctuations, there are occasional vast atmospheric waves, due perhaps to previous winds, to great local disturbances of temperature, or to combinations of causes not yet understood. The disturbances by heat that give rise to ordinary periodical or irregular winds, are such as occur along certain latitudes, or as are local and irregular altogether. An increase of temperature equal to 50° F. dilates the air receiving it by only about one tenth of its volume. From the direct rays of the sun air absorbs heat chiefly near the surface of the earth, and yet slowly even here, the warming of the air being more largely due to secondary radiation from the heated surface of the land or water. The heat acquired within a given time is usually by a very gradual increase, and limited in amount. If the warming of the air is quite uniform over a large surface, the equilibrium between the affected and the surrounding bodies may be steadily adjusted and preserved, so that no wind shall result; and it is a common experience of the hot season that, though the air at a place may be intensely heated, or through many degrees within a few hours, yet no wind may occur. During subsequent cooling of the same body of air a wind is more likely to arise, and especially so if clouds form at no great distance. Very generally, however, the effect of heating a tract of air in excess over that around it, is to occasion expansion and diminution of density; the column of air so affected moves or flows upward, and while the effect of its momentum further relieves its lowermost portions of pressure, and diminishes the resistance they can oppose to the surrounding air, the ascending body, losing at considerable height its excess of heat, acquires the density of air at such elevation, and flows over or outward, increasing the weight and pressure of some or all the surrounding portions. The lateral equilibrium below is thus destroyed, and a double movement of the air established, the air flowing in from one or more directions below the heated space, and flowing out above. But the momentum acquired in some given direction by the air rushing into the affected space may predominate, and, the conditions of neighboring portions of air favoring, a wind may thus be established that shall blow far beyond the point of first disturbance, as well as successively affect portions of atmosphere further back of it, and also extend widely, continuing for a long time before equilibrium and calm are restored. As a well known fact, however, high or widely extending winds are more likely to arise just before or during storms in which a considerable body of watery vapor is condensed and precipitated from the air, and yet more likely to be felt chiefly after such storms. Winds are also known to be produced in consequence of rapid and great evaporation, and even during the rapid formation of belts or masses of cloud without rain. In all the great oceans, however, there are certain winds, called trade-winds, which always blow in the same direction, though with seasonal variations in the area over which they blow. These are cold currents of air constantly flowing in from the polar regions to replace the warmer and lighter air which is constantly ascending from the tropical belt, and which finds its way back, at first entirely through the upper strata of the atmosphere, to the regions in which the cold currents take their rise.

The direction of these winds, which is nearly due west, but slightly south or north, according as it is a northeast or southeast trade-wind, results from the axial rotation of the earth from west to east. The general character of the air-movement is twofold. There is a movement from the poles toward the equator, and a return movement from the equator to the poles. In low latitudes the latter takes place exclusively in the higher strata of the atmosphere, but in higher latitudes its effect is often felt on the surface of the earth. In these latitudes, then, the winds may be divided into equatorial and polar, the former being as a rule more or less westerly, the latter more or less easterly. The equatorial winds are distinguished in general by the highest temperature, the greatest degree of saturation, the most cloudy weather, the most frequent rainfall, and the lowest atmospheric pressure; and the polar by the lowest temperature, the least degree of saturation, the clearest weather, the least rainfall, and the highest atmospheric pressure. This explains why the southwest wind is that which brings the most rain, and why a falling barometer is as a rule a sign of approaching rain, and also why the barometer, as is well known, usually shows an upward tendency with an east wind. Certain winds have a seasonal character, being either confined to certain seasons of the year, as the harmattan of the Guinea coast and the etesian winds that blow from the north in summer in the eastern part of the Mediterranean, or changing their direction at certain seasons, such as the monsoons of the Indian Ocean. See METEOROLOGY.

Wind-flower, the delicate *Anemone nemorosa*, *A. quinquefolia*, and other members of this genus of the *Ranunculaceae*, so-called because the ancient Greek name of some plant associated in Greece with the winds has been given to the *Anemone*, or because the little plants bloom when spring winds are rampant. The two species mentioned send up an early flowering stem, bearing about its centre a whorl of three digitately divided leaves; above them is a solitary white-petaled starry flower, often tinged with shell-pink on the outside. They expand fully only in sunshine, and nod with half-closed corollas on cold, dark days, and at night. The plants choose mossy stumps in swamps, or damp thickets for their habitat, and have large basal leaves later in summer. On the prairies the red wind-flower (*A. multifida*) and the pasque-flower (*A. patens var. nuttalliana*) bear this name. Another European wind-flower is *Gentiana pneumonanthe*, a low, blue-flowered marsh plant.

Wind Instruments, a general name for musical instruments played by the human breath, as the flute, the cornet, etc., or by artificially produced currents of air, as the organ, harmonium, etc., in all of which the vibrations of a column of air produce the sound. The wind instruments of an ordinary orchestra are usually divided into two classes: wood instruments and brass instruments; the organ or harmonium being classed apart. The woods, some of which are partially composed of ivory, are the piccolo, flute, flageolet, clarinet, basset-horn, oboe, and bassoon. Their tone is light, smooth, and soft, and almost vocal in its character, and can be produced in all the delicate

WIND SIGNALS — WINDLASS

crescendo and diminuendo shadings. The brasses comprise the cornet-a-piston, horn, trumpet, trombone, euphonium, bombardon, etc. Their tone is somewhat harder, and generally more powerful and majestic than that of the woods. Being fixed-toned instruments (except the trombone) they cannot, like the strings, play in perfect tune, and they can only produce one sound at a time. For the number of the wind instruments and their proportion to stringed and percussion instruments in an orchestra, see ORCHESTRA.

Wind Signals. See WEATHER SIGNALS.

Windage. See PROJECTILES.

Wind'ber, Pa., borough in Somerset County, on the Pennsylvania and the Johnstown Passenger R.R.'s; about eight miles east of Johnstown. It is in an agricultural and coal-mining region, and has extensive coal-mining interests. The Berwind White Coal Mining Company have 10 operations, in which are employed 5,000 persons. In the W. P. Kelley Brick Company works there are about 100 men; and in the planing mills and construction works of the Pennsylvania Lumber and Construction Company, about 80 men are employed. Other industrial establishments are a brewery, machine shops, coal, brick and lumber yards. The Lake Trade Coal Company, which has operations and large coal holdings at Hilliard, Butler County, has its home office in Windber. The borough is well laid out; it has wide streets paved with brick; and a number of fine buildings. There are three large public schools containing 20 rooms. One building was erected in 1903 at a cost of \$50,000. There are two banks; the Windber national bank has a capital of \$50,000. There are seven church buildings, one mission, and a strong Y. M. C. A. organization. The borough has a municipal hall. The government is vested in a burgess and a council of seven members. The expenses annually of the excellent volunteer fire department are \$10,000.

The Berwind White Coal Mining Company were chiefly instrumental in establishing the borough, by means of their extensive operations and coal holdings in the vicinity. Nearly all their employees reside in the borough. Windber was laid out for an industrial centre and an ideal residential town. The town was platted by J. S. Cunningham, and in 1900 it was incorporated as a borough. It has water-works, electric lights, and two newspapers. Pop. (1904) 8,000. About 75 per cent are foreign born.

AMOS CLAAR,

Editor 'The Windber Era.'

Windbreak, in agriculture, rows of trees planted along the edge of fields of grain, orchards, etc., to break the force of the wind and to protect the crops.

Winder, win'dér, **William Henry**, American general: b. Somerset County, Md., 18 Feb. 1775; d. Baltimore 24 May 1824. He was graduated from the University of Pennsylvania and became a lawyer in Baltimore. In March 1812, at the breaking out of the War of 1812, he was appointed lieutenant-colonel of infantry, and was made colonel in July of the same year. He led a successful expedition from Black Rock to the Canada shore, 28 Nov. 1812; was promoted to be brigadier-general in March 1813; ap-

pointed adjutant and inspector-general in May 1814; commanded at the battle of Bladensburg, and the unsuccessful defense of Washington, in August 1814; and was honorably discharged in June 1815. He then resumed his law practice, and was subsequently a member of the Maryland senate.

Windermere, win'dér-mër, or **Winander-mere**, England, a lake in Lancashire and Westmoreland, about 11 miles in length, and from one third of a mile to a mile in width, its area being a little over five square miles; its depth varies from 30 to 240 feet. Its outlet is the river Leven, which discharges its waters into Morecambe Bay. The lake is surrounded by gentle, well wooded eminences, and the neighborhood is noted for its beautiful scenery, celebrated by the Lake poets, Wordsworth, Coleridge, and Southey. Wordsworth lived at Rydal Mount, about two miles from the head of the lake. Windermere, pop. (1901) 2,379, is a small town near the eastern shore.

Wind'galls, puffy swellings about the fetlock-joints of animals, particularly of horses, resulting from an increased secretion of synovia arising from work, particularly on hard roads; they are generally unassociated with any pain, heat, or lameness, and are not generally considered to be causes of unsoundness. If the horse be young they may disappear if the animal be allowed a long rest and the parts blistered once or twice. Old horses having wind-galls are generally kept at work, the legs being bandaged when in the stable.

Windham, win'dam, **William**, English orator and statesman: b. London 3 May 1750; d. there 4 June 1810. He was educated at Eton, Glasgow, and Oxford, and was returned to Parliament as member for Norwich in 1784. During the early part of Pitt's administration he sat in the opposition, but during the course of the French Revolution joined Burke in condemning the revolutionary principles, and advocating the war that Pitt declared against France. He was secretary-at-war in Pitt's cabinet 1794-1801, and under the Fox and Grenville ministry, which came into office in January 1806, held the rank of colonial secretary. During his tenure of office, which continued till March 1807, he brought in and succeeded in passing against strenuous opposition, a measure for reducing the duration of the period of enlistment for soldiers, and making various provisions for improving the condition of the soldier. Windham was a man of thoroughly independent character, but his independence sometimes passed over into eccentricity. A collection of his speeches with a 'Life' by Amyot, was published in 1806; his diary, edited by Mrs. Baring in 1866.

Wind'hover, a name in Great Britain for the kestrel (q.v.), referring to its habit of holding a stationary position facing the wind, while it searches the ground beneath it for indications of prey.

Windlass, in mechanics, a machine for raising weights from a pit, consisting of a cylinder or roller moving on an axle supported on a frame, and turned by levers inserted in square holes cut in the cylinder, or by a crank fitted on to one or both ends of the axle. One end of a rope or chain is attached to the cylinder, and

WINDMILL

the other to the weight, which is raised by the rope being shortened in passing round the roller.

Windmill, a machine for furnishing power for grinding grain, pumping water, or doing other useful work, operated by the wind. History does not record the date of invention of the windmill; but it is known that it was used in Europe as early as the 12th century A.D. A common form of European windmill is shown in figure 1. The sails, upon which the wind

FIG. 1.

acts in driving the machine, consist of a light framework upon which canvas is stretched. The surface of the canvas makes an angle (called the angle of weather) with the plane of the windwheel, and this angle is usually about 18° at the inner end of the sail, gradually decreasing to about 7° at the outer end. The length of the sail is generally about five sixths the length of the arm, the width of the outer end one third the length, and the width of the inner end one fifth the length. For proper action the axis of the windwheel shaft should be parallel to the direction of wind. In most cases it is, however, inclined upward at an angle of about 15° to permit the ends of the sails to clear the tower, and since the direction of the wind is, in general, horizontal, this condition for proper action is not fully realized in windmills of the European type. To allow the windwheel to be turned as the direction of the wind changes, the upper part of the structure is adapted to rotate about the vertical axis of the tower, being supported upon rollers at A, and the auxiliary wheel B is provided to maintain it in its proper relation with the direction of the wind. This auxiliary wheel is so connected, by gearing, with the fixed part of the structure that in rotating it causes the movable part of the structure to turn about its axis. When the main windwheel is properly directed the auxiliary windwheel pre-

sents its edges to the wind, and is therefore not affected by it; a change in the direction of the wind tends to cause rotation of the auxiliary wheel which in rotating brings the main windwheel into proper relation with the wind. Before the invention of the auxiliary steering wheel, and to a large extent after its invention, the main windwheel was kept in position by hand. In many cases the whole tower, instead of merely the upper part thereof, is made to pivot about its vertical axis, this latter construction being generally followed in German practice, while that above described is common to machines built by the Dutch. In some very crude windmills of the European type no provision whatever was made for changing the direction of the windwheel. The speed of a windwheel tends to vary with the wind velocity. In windmills of the European type, where speed regulation is desired, it is accomplished by varying either the load or the sail area exposed to the action of the wind. A friction brake is often used to vary the load, while to vary the sail area the canvas forming the sail surface is rolled up or unrolled, or the sail surface is formed from slats, after the fashion of the Venetian blind, and changed by opening or closing the slats. The devices for varying the sail area are actuated either by hand or by a suitable automatic governor. It is to be observed that the sails of the European windmill occupy only a small portion of the area swept by them. In the American type the sails are much greater in number and occupy, comparatively, a much larger part of the area swept by them. The greater number of sails makes it possible to reduce the diameter of the windwheel, for a given power, considerably below that necessary in the European windmill; as a result the American windmill is much smaller than that of Europe. The windwheels of the latter were often as large as 100 feet in diameter; those of the American type are rarely larger than 30 feet in diameter.

FIG. 2.

American windmills are built in a very large variety of styles, some being constructed principally of wood, others entirely of metal. Each is, however, designed to automatically maintain

WINDMILL

the windwheel in its proper relation with the direction of wind, to deliver the power developed either by means of a rotating shaft or re-

FIG. 3.

ciprocating rod, and to automatically keep its speed below a certain definite and safe limit. A certain number of methods have been devised for each of these operations. Different combinations of these methods, together with variations in minor details, result in the large variety of styles. Figures 2, 3, and 4 show several windmills of the American type, these particular forms being selected because among them may be found examples of each of the methods by which the results before mentioned are accomplished. The windwheel may be held in proper position with regard to the direction of wind in three ways, namely, by means of a rudder or tail, as in figures 2 and 3, by means of an auxiliary steering wheel, as in figure 4; and by the pressure of the wind upon the windwheel itself, which is placed on the opposite side of the tower to that from which the wind proceeds, as in figure 4. When the windmill is to be used for pumping purposes exclusively, the power is, in general, transmitted from the windmill to the pump by means of a reciprocating vertical rod, as in figures 2 and 3. Those in which the pump rod makes one complete stroke for each revolution of the windwheel, as in figure 4, are termed direct stroke windmills; when the pump rod makes only a fraction of a stroke for each revolution of the windwheel, as in figures 2 and 3 the windmill is said to be back geared. The back gearing may be accomplished either by means of a pair of spur gears, as in figure 2, or by means of a rack and pinion, as in figure 3. In pumping windmills of recent construction back gearing is very largely employed, its object being to avoid the great shocks and vio-

lent churning of the water resulting from the rapid action of direct stroke windmills, and to reduce the losses in the pump due to friction and to backlash of the valves. When the windmill is to be used for general power purposes, which may include pumping, sawing, grinding, etc., the power is transmitted through a train of gears to a vertical shaft, those of this general type being known as geared, or power windmills. Any torque exerted by the gearing upon the vertical shaft reacts upon the windmill itself, tending to rotate it out of its normal position with regard to the direction of wind. Neglecting friction, the torque at the vertical shaft is equal to that exerted by the windwheel divided by the number of turns which the vertical shaft makes to one turn of the windwheel. Hence the effect of the vertical shaft in disturbing the position of the windwheel becomes smaller in amount as the ratio of gearing between them is increased, and for this reason the ratio of gearing is in best practice made about six to one; that is, the vertical shaft makes six revolutions to one revolution of the windwheel. This high ratio is also an advantage in that it allows the diameter of the vertical shaft, for a given size of windwheel, to be made considerably less than that which would be necessary with a smaller ratio.

When the pressure of the wind upon the windwheel becomes so great as to approach the danger point, it is lessened by reducing the sail area exposed to the wind. In the windmill shown in figure 2 the windwheel is so placed that a line drawn through its centre parallel to the

FIG. 5.

normal direction of the wind passes to one side of the axis about which the windmill pivots. The tail is in each case supported upon the windmill frame by the hinge joints C, C', and is held in its normal position with reference to the windwheel by the spring D. Wind-pressure upon the windwheel tends, therefore, to stretch the spring, and it does so when it is sufficient to overcome the initial tension of the spring, thus turning the windwheel so that the wind acts obliquely upon it, and reducing the exposed sail area. The initial tension of the spring is so determined that

WINDMILL

it will begin to stretch when the pressure of the wind upon the windwheel approaches the safe limit. In the windmill shown in figure 3 the windwheel is so placed that a line through its centre parallel to the normal direction of the wind intersects the axis about which the windmill pivots. The side vane E is fixed to the windmill frame, upon which the tail is also carried, being supported by the hinge joints, C, C'. The tail is held in its normal position with reference to the windwheel by means of the spring F. Pressure of the wind upon the vane E tends therefore to stretch the spring F, and the spring is so determined that it will be stretched when the wind pressure upon the vane E approaches the safe limit. As the spring is stretched the position of the windmill is changed so that the exposed sail area is reduced, in the same

posed sail area. Other methods of regulation, involving centrifugal governors or variations from the arrangements above described, have been devised, but have not come into extended use. The particular mechanical details involved are subject to very wide variation, but the arrangements shown in the figures serve to illustrate the principal types.

Windmills of the usual forms are, in general, mounted upon towers of heights ranging from ten to a hundred or more feet, so that the wind which acts upon them will not be seriously affected by obstructions which may exist in their immediate neighborhood. Provision is always made for controlling, or furling, the windmill from a convenient place near the base of the tower, generally by means of a wire, termed the furl-wire. Furling is in general accomplished

FIG. 4.—Vaneless Aeromotor.

manner as with the windmills shown in figures 2 and 3. In the windmill shown in figure 4 it is evident that any change in the relative positions of the steering wheel and the main windwheel will result in a change in the position of the latter relative to the wind. The frame carrying the steering wheel is pivotally mounted upon the frame which carries the main windwheel, and is held in its normal position with reference to it by the coiled spring H. In the ordinary running position the wind falls perpendicularly upon the side of the tail of the steering wheel, and when the pressure upon it exceeds the safe limit it overcomes the resistance of the spring and changes the position of the steering wheel so that the wind falls upon its face; this causes the steering wheel to act, which moves the main windwheel so that the wind falls obliquely upon it, thus reducing the ex-

posed sail area to such an extent as to prevent the action of the windmill. The reduction of the exposed sail area is in each case accomplished in the same manner as in the process of regulation, except that the force necessary to lift the weight or overcome the tension of the spring is applied through the furl-wire and transmitted by a suitable arrangement of levers or pulleys, instead of being supplied by the energy of the wind. Thus in the windmills shown in figures 2 and 3 a pull transmitted through the furl wire is applied to the tail in such manner as to bring it into a position parallel to the plane of the windwheel. In that of figure 4 the auxiliary wheel is turned through an angle of 90° by means of a pull on the furl-wire. It is to be observed that in each of the windmills heretofore mentioned the windwheel is adapted to rotate about an axis the normal

WINDMILL

position of which is parallel to the direction of the wind. A number of types of windmills have been devised in which the windwheel rotates about an axis, the normal position of which is in a plane perpendicular to the direction of the wind, but they have not attained a

FIG. 6.

sufficient degree of success to warrant considering them here. If A represents the plane area, in square feet, swept by the sails of the windwheel, V , the velocity of the wind in feet per second, and δ the weight in pounds of a cubic foot of the air, then the weight of air available per second for use by the windwheel is

$$W = AV\delta, \text{ and its energy is equal to } \frac{WV^2}{2g}$$

g being a constant representing the acceleration due to gravity. The power in foot-pounds per second brought to the windwheel by this air is,

$$\text{therefore, } L = \frac{WV^2}{2g} = \frac{V^3 A \delta}{2g}. \text{ This expression}$$

indicates that, other conditions remaining the same, the power of a windwheel varies directly as the cube of wind velocity, and directly as the area swept by the sails, both of which relations have been substantially verified by experiment. In the construction of windmills considerations of strength require that, in general, the linear dimensions of all of the parts shall bear the same proportional relation to each other, regardless of the size of the windwheel. Other conditions being equal, the weight of a windmill, therefore, varies directly as the cube of the diameter of its wheel, while its power varies directly as the square of the diameter of the wheel. Hence, in increasing the size of windmills, the weight, and the consequent cost of material, increase more rapidly than the capacity, and it is not, therefore, found practicable to increase their size beyond a certain degree. When a windmill is in operation the air currents which act upon it are so modified and broken up, by their contact with the sails and other members, as to render accurate mathematical treatment of the case impossible, in the present state of our knowledge. For this and other reasons, mathematical considerations of the case are chiefly of theoretic interest, and the development of the form of the windwheel has been due rather to experiment than to theory.

The most notable among the experiments which have been made upon windwheels are those made about the middle of the 18th century, upon windwheels of the European type, by John Smeaton, and those made in 1882 upon windwheels of the American type by Thomas O. Perry. In these experiments the following im-

portant facts were, among others, established: (1) The maximum power which may be obtained from a given windwheel varies directly as the cube of the wind velocity. (2) The sail speed of a windwheel, when developing its maximum power, varies directly as the wind velocity. (3) The load upon a windwheel, when developing its maximum power, varies directly as the square of the wind velocity. (4) The capacity of a windwheel varies directly as the square of its diameter. (5) The number of turns which a windwheel will make in a given time varies inversely as its diameter. (6) There is nothing gained by having the sail area of a windwheel greater than seven eighths of the area swept by the sails, and there is little gained by having it more than three fourths the latter area.

In order that the maximum power may be obtained from a windmill, in winds of varying velocity, the load must vary directly as the square of the wind velocity. In practice the load is seldom, if ever, made to vary in this manner. The most common form of installation is that in which a pumping windmill is directly connected to a single acting pump operating under a constant head. In such cases the average load during a complete cycle of the pump is practically constant regardless of the wind velocity. Moreover, the load varies, in general, from about zero during one stroke to a maximum at about the middle of the other stroke. This periodic variation of load is also a source of loss, especially when the windwheel is rotating slowly, and the amount of kinetic energy stored in it is small. In the case of power windmills the load depends upon the character of the work. Some grain-grinders

FIG. 7.

for use in connection with power windmills are constructed so that the grain is fed to them by centrifugal action, and in these instances the load upon the windmill is made to increase as the speed increases.

Mathematical Formula.—In the following mathematical discussion all differences of pressure and density in and about the windwheel are neglected, and friction between the air currents and the various members of the wheel, eddies, and similar disturbing effects are also neglected. In order that the sails may derive power from the stream of air particles which acts upon them, the air particles must be deprived of a portion of their velocity by reason of their contact with the sails. The general manner in which this decrease of velocity of air particles occur is indicated in figure 5. The ideal conditions here indicated are assumed for convenience in determining the maximum attainable efficiency. Let V represent the initial velocity and direction of the wind, and V_1

WINDMILL

its direction and velocity as it leaves the wind-wheel. Both V and V_1 are assumed parallel to each other and to the axis of the wheel. Let A = area swept by the sails, and let δ = density of the air. Then the weight of air which acts upon the sails per unit of time is $AV_1\delta$, and the energy given up by the air is, $\frac{AV_1\delta}{2g} V^2 - \frac{AV_1\delta}{2g} V_1^2$. But the weight of air

brought to the wheel per unit of time is $AV\delta$, and its energy is, $\frac{AV\delta}{2g} V^2$. The efficiency of

the wheel is, therefore,

$$E = \frac{\frac{AV_1\delta}{2g} V^2 - \frac{AV_1\delta}{2g} V_1^2}{\frac{AV\delta}{2g} V^2} = \frac{V_1 V^2 - V_1^3}{V^3}$$

$$E = \frac{V_1}{V} - \frac{V_1^3}{V^3}$$

To determine the relation between V and V_1 , corresponding to maximum efficiency, V may be considered constant and this equation then investigated for maxima and minima by means of

the calculus. $\frac{dE}{dV_1} = \frac{1}{V} - \frac{3V_1^2}{V^3}$

Putting $\frac{dE}{dV_1} = 0$,

$$\frac{1}{V} = \frac{3V_1^2}{V^3}$$

$$V^2 = 3V_1^2$$

$$V_1 = V\sqrt{\frac{1}{3}}$$

$$V_1 = .578 V$$

That is, for maximum efficiency, V_1 should be .578 of V . Substituting this value in the expression for efficiency, it becomes

$$E = \frac{.578 V^3 - (.578 V)^3}{V^3}$$

= .578 - .191, $E = .387$. That is, the maximum efficiency attainable is 38.7 per cent. Certain differences of pressure which exist in the region of the windwheel in operation tend to make possible higher efficiencies than this. Experiment indicates that efficiencies slightly in excess of 38.7 per cent may actually be realized.

For perfect action between a moving vane and a stream of fluid particles, the direction of the stream relative to the vane must be parallel to the surface of the vane throughout the period of contact, and the velocity of the stream relative to the vane must be constant throughout this period. This condition is indicated by figure 8. In the windwheel, a section of two sails of which is shown in figure 7, it is evident that, there being no change of relative velocity or of density, all of the air which approaches the sail at F cannot pass out at G , owing to the decrease in the width of the passage. Of the air which approaches at F , only

that part which passes between points J and K is effective in doing work on the sail, while the remainder (that which passes between H and J) must pass around the wheel and does no work. In view of these facts, the theoretical efficiency of a given sail element may be determined by the following graphical construction: Let $B D$ (figure 8) represent the actual direction and velocity of the wind. Let $A D$ represent the actual direction and velocity of the sails' motion. Let ϕ be the angle made by the trailing edge of the sail with the plane of the wheel. Then $B A$ = velocity and direction of the stream of air relative to the sail at impingement, and $B'A'$ = velocity and direction of the stream relative to the sail at escape. $B'A'$ is equal in length to $B A$. Now draw $A'J$ parallel and equal in length to $A D$, and draw $B' J$. Then $B' J$ = actual direction and velocity of the stream of air at escape. Draw $B'K$ perpendicular to $B'A'$ produced. Then $B'K$ is the width

FIG. 8.

of the stream of air which acts upon the sail element $A B'$. For convenience the radial depth of the element, and therefore of the stream of air, is assumed to be unity. If δ is the density of the air, the weight of air which acts upon the element per unit of time is $B''K \times BA \times \delta$ (BA being the velocity of flow and $B''K$ the area of the stream). The original velocity of this air was BD , and its final velocity $B'J$. Hence the work done by it is equal to,

$$\frac{B''K \times BA \times BD^2 \times \delta}{2g} - \frac{B''K \times BA \times B'J^2 \times \delta}{2g}$$

But the available energy is equal to

$$\frac{B''B' \times BD \times BD^2 \times \delta}{2g}$$

Hence the efficiency is,

$$E = \frac{\frac{B''K \times BA \times BD^2 \times \delta}{2g} - \frac{B''K \times BA \times B'J^2 \times \delta}{2g}}{\frac{B''B' \times BD \times BD^2 \times \delta}{2g}}$$

$$E = \frac{B''K \times BA \times BD^2 - B''K \times BA \times B'J^2}{B''B' \times BD^3}$$

DANIEL R. SCHOLES,
Of the Aermotor Company, Chicago

WINDOM — WINDSOR

Windom, win'dòm, **William**, American financier: b. Waterford, Ohio, 10 May 1827; d. New York 29 Jan. 1891. He was admitted to the bar in 1850, engaged in law practice at Mount Vernon, Ohio, and in 1852 was prosecuting attorney of Knox County, Ohio. He held this position for three years, when he removed to Minnesota. Sent to Congress from that State in 1859, he was re-elected to serve four successive terms, a period of 10 years, ending his career in the House in 1869. He was appointed to the United States Senate in 1870 to fill the unexpired term of Daniel S. Norton, deceased, and was also elected for the terms ending in 1878 and 1883. He resigned, however, in 1881, to accept the Treasury portfolio in President Garfield's cabinet, and on his retirement from the cabinet after that President's death returned to the Senate, where he served the remainder of his term. He was occupied with various financial interests in New York from 1883-9 when he was appointed secretary of the treasury in President Harrison's cabinet and occupied that position until his death. He was one of the earliest exponents of the gold standard, and was considered available as a Presidential candidate in three National conventions, those of 1880, 1884, and 1888.

Window, in architecture, an opening in the wall of a building to admit light and air into the interior. In dwelling-houses in ancient times the windows were narrow slits, and it was not until about the end of the 12th century that glass was used to any great extent in private houses in England. Windows, properly so-called, were almost unknown in the religious edifices of the Egyptians, Greeks, and Romans, the light being admitted at the roof, but they constitute an essential and distinguishing feature of the Gothic style. In modern houses windows are made capable of being opened and shut by means of casements or sashes.

Window Glass. See GLASS.

Window-pane, a small American flatfish. See TURBOT.

Window Shades. Practically, shades are curtains, but are rolled up instead of being divided and looped up. Curtains have been known from remote times. In the 'Arabian Nights' there are constant references to curtains, and in the description of the Israelite tabernacle are elaborate instructions of the way in which the curtains are to be made and looped up. In modern communities dwellings are required having windows from which light can be excluded, although admitting air. This is afforded by outside or inside shutters, or by curtains of rushes or reeds. But some 40 years ago it was found that the shades or curtains then made could be rolled up on a stick, held to the right height, or pulled down when required, the power being furnished by a spring. So common has this contrivance become that almost every house is now supplied with shades moving in this way, and the manufacture of them has become a great industry. Some are moved by weights, and there are various minor contrivances. The cloths used generally imitate a brown holland. See CURTAIN.

Window Tax, a tax, formerly imposed in Great Britain on all windows in houses (latterly

above six in number). It was abolished in 1851, a tax on houses above a certain rental being substituted.

Window Tax War. See UNITED STATES, WARS IN THE.

Windsor, win'zor, Canada, a seaport town, capital of Hants County, Nova Scotia, on an inlet of Minas Bay, and on the Windsor & Annapolis Railway, 45 miles northwest of Halifax. Its chief institution is King's College (q.v.), or Windsor University, founded in 1788. It is a busy shipping port, is electrically lighted, and has a considerable export trade in the gypsum and limestone of the region. Pop. (1901) 3,398.

Windsor, Canada, the largest town in Essex County, situated on the banks of the Detroit River, opposite the city of Detroit. Five railways enter the city, including the Grand Trunk, Canadian Pacific, Michigan Central, Wabash, and the Ontario division of the Pere Marquette. The location makes Windsor one of the desirable residential cities of the continent. It has 10 churches, 10 schools, a Collegiate institute and Saint Mary's Academy. The chief manufactures are the Canadian Salt Co. paint and varnish works, sash, door and planing factories, boiler works and machine shops, with various minor industries. It has several miles of paved streets and an adequate sewerage system. There is a rapid increase in population which at the present time (1905) is 14,000.

Windsor, Conn., town in Hartford County; on the Connecticut and Farmington rivers, and on the New York, New Haven & Hartford Railroad; six miles north of Hartford. It is in an agricultural section in which the chief products are vegetables, fruit, and tobacco. The principal manufactures are worsted goods, paper, electrical motors, knit goods, tobacco products, and dairy products. The educational institutions are the Hayden Hall-Home School for Girls, a town high school, kindergartens, 10 public schools, and a public library.

The first settlement was made in 1633 by William Holmes and companions, from Plymouth. They established here a trading post. In 1835 Roger Ludlow and a colony from Dorchester, Mass., settled near the trading post and called the place Dorchester. In 1637 the name was changed to Windsor. In 1639 Windsor united with Hartford, and Wethersfield, under "Fundamentall Orders" to form the commonwealth of Connecticut. Pop. (1890) 2,954; (1900) 3,614. Consult: Stiles, 'Ancient Windsor'; 'Memorial History of Hartford County.'

Windsor, or **New Windsor**, England, a town in Berkshire, on the Thames, 21 miles by rail west of London. Windsor and Eton (q.v.) practically form one town, which is chiefly interesting on account of the castle and park, a favorite residence of the English sovereigns since the time of William the Conqueror. The original royal palace was at Old Windsor, about two miles distant. The present palace dates from the reign of Edward III., who built the dominating Round Tower, 80 feet high, to accommodate the round table of the Knights of the Order of the Garter. The buildings comprise upper, lower, and middle wards, extending along the crest of an eminence rising 42 feet above the river, and covering 12 acres in the

WINDSOR CASTLE—WINE AND WINE-MAKING

Little or Home Park, which is connected with the Great Park and the adjoining Windsor Forest, the whole occupying an area of 13,000 acres, 56 miles in circumference. The Lower Ward on the west contains Saint George's Chapel, the sumptuous Albert Chapel, the houses of the military knights, cloisters, etc., the Middle Ward, the Round Tower already mentioned, and the Upper Ward on the east, the sovereign's private apartments, the library, and the long corridor. Under Saint George's Chapel is the burial vault of several English rulers, and members of the royal family. The royal palace and the mausoleum of Frogmore, Cumberland Lodge, and Virginia Water are in the park. The town-hall of Windsor was built by Christopher Wren in 1658. Pop. (1901) 13,958.

Windsor Castle. See WINDSOR, or NEW WINDSOR, England.

Windsor Knight, in Great Britain, a name given one of a body of military pensioners having their residence within the precincts of Windsor Castle. They are now called Military Knights of Windsor, and sometimes Poor Knights of Windsor.

Windsor Locks, Conn., town in Hartford County; on the Connecticut River, and on the New York, New Haven & Hartford Railroad; about 12 miles north of Hartford. It was a part of the town of Windsor until 1854, when it was set off and incorporated. It is a manufacturing town; extensive water-power is obtained from the Connecticut by means of a canal. The chief industrial establishments are paper mills, cotton yarn and thread factories, a foundry, machine shops, steel works, and silk factories. Other manufactures are furniture, trucks, school globes, and carpet-loom chains. In 1900 (government census) Windsor Locks had 37 manufacturing establishments, capitalized for \$2,117,159; the annual output of which was valued at \$1,311,768. The principal public buildings are Memorial Hall, presented by Charles E. Chaffee to J. H. Converse Post 67, G. A. R.; four churches, and the public and parish schools. It has one bank. Pop. (1890) 2,758; (1900) 2,997.

Windward (wind'ward) **Islands**, a group of the West Indies forming the southern part of the Lesser Antilles, including Saint Lucia, Saint Vincent, Grenada, and the Grenadines. They are of volcanic origin, the larger islands are mountainous; the lower levels being generally fertile and producing sugar, cocoa, and spices; logwood and other timber are also obtained. They belong to Great Britain; the governor resides at Saint George's, Grenada. The islands have no common legislature, laws, or tariff; but there is a common court of appeal, and they unite for other purposes. See also the names of the individual islands of the group.

Wine and Wine-making. It may have been design, but it was probably an accident, that first led man to crush or to press grapes in order to obtain a palatable and stimulating beverage. As long as the juice is confined within the grape, it becomes sweeter and sweeter as the fruit grows riper and riper. But when the skin is broken by crushing or pressing, and when the juice is allowed to remain a short time exposed to warmth and air, it changes its

character and develops new and unsuspected qualities or properties.

The series of changes from the fresh grape juice to an alcoholic drink may be best illustrated by describing the process briefly as follows:

When the juice, or "must," is exposed to temperatures ranging from 59° F. to 65° F. the liquid very soon begins to become turbid, small bubbles collect on the surface and the grape skins, stems, and other solid particles, form a dense cover or "cap" on the top. Carbonic gas, which is developed in increasing quantities, escapes with a loud bubbling sound, and, as the temperature rises, the juice appears as though it were really boiling. After a few days, and sometimes after a few hours, the ebullition subsides and gradually the crust and undissolved substances fall to the bottom. Meanwhile, the must has lost its sweetish taste, and its original character and chemical composition; among other things, it has acquired a richer, deeper color, a vinous flavor and odor, and a certain amount of alcohol.

This interesting natural process, which leads to the formation of alcohol, was described by the term "fermentation," from the Latin *fermentum*, the root word being *fervere*, to boil. This feature of the phenomena, whereby the evolution of the gas makes the liquid appear to boil, evidently struck the early wine-makers and natural philosophers as most important. It was a long time before the true nature of the process of vinous or alcoholic fermentation was clearly perceived and properly understood.

Early in the last century (from 1810-25) chemical analyses by Gay-Lussac, Thénard, and De Saussure fixed accurately the composition of sugar in the must and of alcohol in the wine. In 1835 Cagniard de Latour found that the globules were definite organisms, capable of reproducing themselves by budding, and thus apparently belonging to the vegetable kingdom. He came to the conclusion that, in the course of vegetation, these globules, or "ferments," disengaged carbonic acid gas and converted the liquid into an alcoholic liquor.

This discovery, which is at the basis of the modern principles and practices of wine-making, was confirmed two years later (1837) by Schwann at Jena and Kützing at Berlin. The newly-found organism was regarded by some as belonging to the fungi and by others to the algæ. Meyen showed that the organism was a fungus, and established a new genus for it under the name of *Saccharomyces*. In other words, the agents of alcoholic fermentation are called "yeasts" and belong to the order *Saccharomyces*.

Recent Researches in Alcoholic Fermentation.—The work of the great chemist Pasteur threw a flood of light upon the whole process of fermentation. His investigations extending over a series of years were first summed up in his 'Studies on Wine' (*Etudes sur le Vin*), published in 1872, and further in his book, 'Studies on Beer' (*Etudes sur la Bière*), published in 1876.

To Pasteur belongs the honor of establishing beyond question that fermentations were the work of infinitely small organisms called "microbes." He classified and described many of these micro-organisms. He divided them into two classes: aerobic, those which can not live without the presence of free air; and anaerobic,

WINE AND WINE-MAKING

those which can exist in the absence of air. The former saccharomyces are found at or near the top of the liquid during fermentation; the latter are at work lower down in the body of the liquid.

The microscopical examination of the agents of alcoholic fermentation has revealed quite a number of different forms and varieties. Some 25 or 30 types of the genus *Saccharomyces* have been identified.

The question may very naturally be asked: Where do these yeast organisms come from? Pasteur showed very clearly that the ripe grape is covered with a mass of micro-organisms. These microbes collect on the fruit and stems, and constitute the "bloom" of the grape. Just why they should fix themselves on the fruit, and remain, as it were, in readiness to be transformed from their dormant state to one of great activity when carried into the juice of the fruit is a mystery. At the same time a great number of other and less desirable yeast cells (bacteria) become submerged in the grape juice, or must, and these foreign yeasts are the ones that give the wine-maker trouble, and lead to many diseases of wine.

Cultivated and Selected Yeasts in Wine-making.—A brilliant Danish chemist, Emil Chr. Hansen, took up the study of alcoholic fermentations and "disease ferments," where Pasteur left off. He brought out many new facts with regard to the many different races or species of *Saccharomyces*, which gave very different characters to beers. Hansen found that it was practical to separate and cultivate the better species or races of brewer's yeasts. With great skill and much care he was able to select two varieties of "low" yeast and then he worked out a method for the pure cultivation of yeast.

The use of pure cultivated yeasts has been attended with good results in wine-making. Musts have been prepared with pure yeasts and have been compared with musts fermented at the same time without such yeast. In most cases the pure-yeast wine has been regarded as superior to the other. One practical value of employing pure cultivated yeasts in wine-making is that under proper conditions they will control the progress of fermentation, and thus overcome the influence of the undesirable organisms in the must, such as mold-fungi, wild yeasts, bacteria, and mycoderma. By using selected yeasts from celebrated vintages, wine-makers have been able to obtain finer flavors and bouquets, all of which adds to the quality and value of their product.

Fermentation and Enzymes.—In order to grasp and properly understand the various problems connected with the phenomena of fermentation, it is necessary to say something about its relation to enzymes. The term "enzyme" is now used to indicate the soluble ferments secreted or formed in the yeast cell. Pasteur's theory makes fermentation a vital act, depending on a living organism. Recent discoveries show fermentation to be also a chemical act. A few years ago the German chemist, Büchner, proved that alcoholic fermentation can be carried out by a soluble ferment which is extracted from the yeast cell. So that we can have the phenomena of fermentation without the growth and multiplication of yeast cells. To this enzyme in the yeast extract Büchner has given the name *zymase*.

The effect of these recent discoveries in fermentation may be very great and far-reaching, and just what practical form they will take in wine-making and other industries it is impossible to predict.

The Vintage.—The word "vintage" has come to have quite a wide signification. It may be used to include three distinct steps: (1) the gathering of the grapes; (2) the processes of fermentation, and (3) the general cellar operations connected with the care and handling of the new wine.

The practices of wine-makers are different in different countries, and in different localities of the same country. This is owing to difference in soils, climates, conditions, varieties of grapes used, and in the kinds or types of wines to be produced. And yet, the main principles which give the best results in practice in one country are practically the same in any other country where wine is made.

It should be borne in mind, however, that wine-making is partly an art and partly a science. As such, it can not be learned and mastered by reading, or from books. The best we can here do is to describe briefly some of the more important details connected with the manufacture of wines.

Gathering of the Grapes.—The general rule is that grapes should not be gathered till they have reached a state of complete maturity. This condition is shown by certain well-known indications, such as the brownish color of the stem, the softening of the berry, and its easy separation from the stem, the skin is translucent, the juice becomes sweet, thick, and somewhat sticky.

The wine-maker determines the best time for gathering the grapes by using various instruments, known as a must-scale, mustimeter, glucometer, etc. They are employed for the purpose of finding out the saccharine richness or strength of the grape juice, or must. To judge of the sugar content of the grapes a few bunches representing the average condition are first gathered, the juice is expressed and strained through a cloth, collected in a suitable receptacle, and then the must-scale is carefully dropped into it. The quality of the must will be indicated on the stem of the scale. The grapes should be tested from day to day until the density, as shown on the scale, remains stationary, when it is time, as a rule, to gather the crop.

The oldest scale, that of Baumé, was devised to indicate the specific gravity of liquids, or their weight, as compared with that of water. Later scales give the density of the liquid direct, the density of water being indicated by 0. The glucometer invented by Dr. Guyot is very convenient and is used by the French wine-makers. This scale indicates at once, the degree Baumé, the quantity of sugar in the must per hectolitre, and the amount of alcohol that will result from the fermentation of the must per hectolitre. The Salleron mustimeter is another very useful instrument, highly regarded by French wine-makers. The instruments mostly used in this country are Oechsle's must-scale and Balling's saccharometer. All the different must scales are also used during fermentation to determine when the sugar contained in the must has been entirely transformed into alcohol.

Composition of the Must.—A very good idea of the qualities of a good, average must may be

WINE AND WINE-MAKING

gained from the following table prepared by Dr. Guyot:

Water	78.
Grape sugar (glucose)	20.
Free acids (tartaric and tannic, etc.)	0.25
Bicarbonate of potash	1.5
Mineral salts	0.20
Albuminous substances	0.05
Essential oils	
Mucilaginous and starchy substances	
Total	100.00

It should be pointed out that, of course, these different ingredients are not always in the same proportion; that some of them may rise to double the average quantity above given, or may fall, in some cases, to one fourth of it. In brief, the composition of the must varies according to the variety of grape, degree of maturity, kind of soil, climate, etc.

After water, grape sugar, or glucose, is the most important element of the must. By the agents of fermentation, it is transformed principally into alcohol and carbonic acid. This transformation is represented by the following chemical formula:

There remains a very small proportion of glycerine and succinic acid, and matters dissolved in the liquid. According to Pasteur, 100 parts of glucose yield through fermentation: Alcohol, 48.46; carbonic acid, 46.67; glycerine, 3.20; succinic acid, .61, and other substances left, 1.03.

The organic acids and acid salts, while they exist in very small proportions, have great influence on the course of fermentation and the quality of the product. The must of grapes picked too soon will contain an excess of acids and a corresponding lack in sugar; while in overripe grapes there will be much sugar but a deficiency in acids. Therefore, wine-makers endeavor to correct such imperfections by watering the must, or by adding sugar, or by adding tannic or tartaric acids, etc. To determine the acidity of musts, several instruments, or acidimeters, have been invented. Most of them require considerable skill and knowledge to be properly used, but the Dujardin Acidimetric Tube will answer for all practical purposes.

The other substances contained in the must — albuminous matters, etc.—contribute to the formation of extractive matters, after having served to feed the yeast organism.

Vinification.—The French word "vinification" is a convenient and common term used to cover the details of wine-making. The special treatments of the must result in different kinds of wines.

Thus, we have two distinct classes: (1) "Dry" wines, and (2) sweet wines.

Dry wines are those in which the sugar has been fermented out.

Sweet wines are those which, after their active fermentation, still retain a quantity of sugar. Many of the sweet wines are fortified by the addition of alcohol.

Wines are often classed as "still" and "sparkling."

Still wines are those in which the carbonic acid gas has wholly escaped. Sparkling wines are those which hold a greater or less amount of carbonic acid gas.

It is useful and convenient to make two

classes, namely (a) red wines, and (b) white wines. Red wines are produced from red or other colored grapes, the color being extracted from the skins during fermentation. The coloring matter is purplish blue, but is changed to red by the acids in the must. White wines are produced from both white and colored grapes. In order to avoid dark color, the must is quickly separated from the skins and other solid parts of the grape. The making of white and other special wines requires special treatments, which need not be here described. The following is briefly the method of vinification of red wines:

Crushing.—The ancient method consisted in tramping the grapes with the bare feet or with heavy boots in a big trough from which the juice ran as it was expressed. While this old-fashioned method still obtains in a few districts in Europe, it has been superseded there and in this country by machines, which are called "crushers." There are several kind of mechanical crushers, but the type most generally used consists of a hopper beneath which revolve two grooved cylinders.

The grapes when dumped into the hopper are then crushed between the rollers, which only break the skins without crushing the seeds. They next pass into the stemmer.

Stemming.—Formerly done by hand, or by a rake over a sieve or screen, the stems are now removed by machines in a very ingenious manner. The grapes after passing through the crusher fall into the stemmer. The stems are carried to one end of the machine, where they are discharged; the seeds, skins, pulp, and juice escape through the bottom, and are conveyed by chutes into the fermenting tanks, which are usually on the floor underneath.

Stemming has its advocates and opponents. The advantages claimed for stemming are that it facilitates the free access of air and so helps the fermentation, especially in case of damaged vintages; that stemmed wines have more *finesse* and are more alcoholic than wines from unstemmed grapes. In the South and Southwest of France wine-makers seldom stem their grapes. As a rule grapes are stemmed in the leading wineries in our Eastern States and in California.

Fermenting Tanks or Vats.—These are generally made of oak, although in California redwood has been generally adopted. The capacities of fermenting tanks vary from 1,000 to 10,000 gallons, or more.

There is a difference of opinion among wine-makers as to whether the must should be fermented in open or in closed vats. For open vats it is claimed that the fermentation is generally more rapid and complete, the wine is better colored, etc. Against the open vat, it is urged that, the exposure to the air transforms the alcohol in the "head" or cap, which is raised to the top by fermentation, into acetic acid and thus injures the wine. An easy way to overcome this objection is by having a false head resting on the cap, and thus keep it submerged during the fermentation. The best practice would seem to be in having a submerged head fermentation.

Duration of Fermentation.—This depends on a number of conditions, such as the amount of sugar in the must, the activity of the ferments, the temperature of the vat, etc. It may be completed in two or three days, or it may run on for 15 or 20 days.

WINE AND WINE-MAKING

Three distinct phases of fermentation will be observed: (1) The first day or two when the ferments are multiplying; (2) the tumultuous fermentation, accompanied by a violent bubbling of the liquid and a rise in temperature, and (3) the active but relatively quiet fermentation.

As a general rule, the more rapid the fermentation the better is the result. In the Southern States and in southern California the process may be completed in one, or two days. In the northern or temperate climates the time will run from seven to ten days.

The Influence of Temperature.—As we have already indicated, temperature exerts a controlling influence on fermentation. The yeast works best in temperatures ranging from 59° F. to 75° F. Below 59° its action is very feeble and slow; above 75° fermentation becomes retarded and even stops if the temperature passes much above 90°.

Thus, wine-making both in very hot and in very cool climates often presents many difficulties to be overcome. The must frequently becomes what is called "stuck"—that is, fermentation ceases before all the sugar is transformed into alcohol.

If the trouble comes from too low a temperature, the remedies are: (1) To raise the temperature by heating part of the must; (2) to heat up the fermenting room; (3) to increase the activity of the yeast by adding sediment from vats already through fermentation, and (4) to stir up the pomace so as to bring the germs in contact with the air, as the yeast is always "greedy for oxygen."

When the temperature of the must in the vats rises too high, it is necessary to lower the temperature in one way or another. Several methods are employed for cooling the must. Among these we may mention the use of shallow vats, racking off, and refrigerating systems. The difficulties of wine-making in our Southern States and in Southern California can be overcome only by the adoption of a suitable system for cooling musts.

The success of the wine-maker will always depend on his success in being able to control the progress of fermentation. Therefore, he should be able to control the temperature, which during fermentation has a most important influence (1) on the yield in alcohol, (2) on the qualities of wine, and (3) on the keeping quality of wines.

Drawing off the Wine.—Active fermentation can be recognized as being over, by the falling of the temperature, the settling down of the solid mass, or marc, by the clearing of the liquid, and the vinous taste and smell. The new wine will show from 0° to 2° by Balling's saccharometer, nearly all the sugar having been transformed into alcohol. It is either run into a large tub and emptied into casks, or it is pumped into casks. The drawing off of the new wine leaves in the vat the "marc," which contains a considerable quantity of wine. The marc when pressed furnishes what is known as "press-wine"; this represents usually about one fourth of the product, and the vat-wine three fourths.

Wine Presses and Press Wines.—It is not necessary to enter into a detailed description of the different forms of wine presses. They are worked by a screw or by hydraulic pressure to be operated either by hand or steam power. Where grapes are handled on a large scale, as

in some sections of France and California, continuous presses of recent invention are used. They are composed of two or more cylinders, worked as crushers, and after passing through these cylinders the grapes are carried by a screw, which forces them in a perforated horizontal cylinder, terminating in an orifice through which the marc in a compact cake is expelled. Even the best presses are not perfect as far as the yield or quality of the wine is concerned. Recent experiments show that the marc can be exhausted without presses.

The first run from the press is of course the best. It is often mixed with the vat wine. The second, third and fourth lots are inferior, and seldom mixed with the other wine; the last run is used for making vinegar or brandy.

Utilization of the By-Products.—From the husks and lees are obtained the following products: Second wines, "Piquettes," and by distillation, brandies and tartar. The second wines are produced by adding water to half the amount of the wine already drawn off, sufficient sugar to give from 6 to 7 per cent of alcohol, and tartaric and tannin when acidity is needed. The piquettes are sour wines obtained by adding pure water to the marc, before or after pressing; the cask is filled and closed. In course of time a "wine" having from 3 to 4 per cent of alcohol is produced, but it will not keep long. This is the cheap but healthful drink so largely consumed by the peasants and working people in France.

Brandies.—They are obtained either by distilling the marc direct, or by the distillation of a piquette wash. The best kind of brandy of the Cognac type is produced by distillation of a sound, clean wine. This process of distillation requires improved stills and special treatment. The "wash" for brandy spirits is obtained by running water into a tank filled with the marc, or pomace; the overflow is allowed to run into a second tank containing pomace, and the overflow from this tank passes into a third tank filled with pomace. It is seldom profitable to distil the wash unless it contains from 5 to 7 per cent alcohol.

Tartar.—This is extract from the lees, or deposited as a crust in the vats. It is obtained by causing a mixture of the marc and water to boil slowly for an hour or so, when the boiling liquid is drawn off and cooled the tartar crystallizes out. From the crude product is manufactured "cream of tartar," and tartaric acid.

Manufacture of White Wine.—The making of white wine differs from that of red wine principally in the matter of not having fermentation of the must take place in contact with the skin and solid parts of the grape. Two processes are to be taken into account: (1) The making of white wine from white grapes, and (2) the making of white wine from red or dark-colored grapes. The first-named process is of course the easiest one. Briefly stated, it consists in crushing the grapes, draining them, putting the drained marc in the press, and then leaving the juice from both of the operations to ferment. The main thing is to get the liquid free from impurities, as white wine should be perfectly clear. The usual method is to allow the must to settle and the suspended impurities to be deposited. The liquid must therefore be kept perfectly still for the required time; in other words, it is kept from starting into fer-

WINE AND WINE-MAKING

mentation. This is accomplished by the process called "sulphuring." The effect of applying sulphurous acid to the must is to paralyze the action of the ferments or yeasts.

After the must has become clear, it is separated from the deposit and run into the vat to undergo fermentation. During this process the must should be aerated as much as possible in order to drive off all odor of the sulphurous acid, as well as to encourage the activity of the yeast. The fermentation starts slowly and is always less vigorous than in case of red wines. When the fermentation is over, the white wine should be racked and put in casks which have been lightly sulphured and allowed to remain until perfectly cleared.

The manufacture of white wine from red or dark-colored grapes is attended with much more difficulty and labor than in the process of using white grapes. Without going into details, the main points to be observed are: (1) To avoid breaking the skins of the grapes, and thus start fermentation before crushing; (2) to proceed rapidly with the work of crushing and pressing; (3) to crush the grapes so as not to free the coloring matter in the skins; (4) to suppress all traces of coloring matter in the must, and separate the suspended impurities by the method above described. It is the opinion of expert wine-makers that in order to obtain the best results, white wine should be made from both white and red grapes.

Sweet Wines.—The familiar French term for sweet wines is *vins de liqueur*. These wines are the result of manipulation; that is to say, sweet wines are not obtained by the plain and simple process of fermentation of fresh grapes, but they have more or less alcohol added, and in some cases sugar is added. The best-known types of sweet wines are: Port, Sherry, Tokay, Madeira, Malaga, etc.

Port Wine.—Wines of this type are produced by fermenting the must down to 6 to 8 deg. of sugar, and then from 4 to 7 per cent alcohol is added to arrest further fermentation. This will give a wine having a strength of from 14 to 15 deg. alcohol. In the following spring the wine is racked, and from 2 to 3 deg. more of alcohol added. Thus, in the course of a year or so Port wine is gradually brought up, or "fortified," to 20 and 22 per cent. alcohol. Contributing to the final result are the methods of "blending," whereby color, body, flavor, bouquet, etc., are obtained.

Sherry Wine.—Our word "Sherry" is derived from the Spanish name Xeres, and this type of wine was originally produced and shipped from the town of Xeres. It is made from several varieties of white grapes grown in the province of Andalusia. The usual Spanish custom is to sprinkle each pressing of grapes with a certain amount (two or three handfuls) of gypsum. This operation, called plastering, is regarded as favoring fermentation. The must is fermented down to about 8 or 10 deg. sugar, and then alcohol is added, bringing the wine up to 16 or 18 deg. alcohol.

One feature of the manufacture of sherry wine in Spain is the system of *Soleras*. The word describes fine old mother wine, and the system consists in blending wines of different ages or years. Thus, the casks of sherry wine are arranged in groups, piled in tiers, and the groups graded according to quality. When wine

for blending or shipment is drawn from the group of casks constituting the oldest solera, they are refilled with wine from the casks of the next younger solera, and these again from the next, and so on down to the last group.

Another feature in the production of sherry is baking the wine by natural or artificial heat. The casks containing the wine are ranged in a building with the roof and exposed side covered with glass. The temperature in this sherry house during the day runs as high as 140° F. and is maintained at night by fires. Several of the large producers of sherry in California attain the same end by baking the wine in a specially-built chamber or room, which is heated by steam or hot air.

Champagne and Sparkling Wines.—The word "Champagne" was originally very properly applied to wines, whether still or sparkling, made in the champagne district of France. It now has a wider and more special meaning. By custom and popular usage champagne is the name given to a type of sparkling wine produced by a process of fermentation in the bottle. Thus, we have not only French champagne, but German champagne, Italian champagne, American champagne, etc. Sparkling wines are produced in most wine-making districts; some of the best known are, Sparkling Saumur, Sparkling Burgundy, Sparkling Beaujolais, in France; Sparkling Moselle in Germany; Sparkling Catawba, in the United States, etc. There are also "imitation champagnes." These are still wines which have been made sparkling by having carbonic acid gas forced into them, somewhat after the same fashion as soda water is produced.

The manufacture and manipulation of champagne requires considerable skill and knowledge. Some of the steps in the process may be described:

After the wine has gone through its first fermentation, it is racked off into casks, and a blend of the juices of different grapes is made. Then the wine is bottled and put in a warm place in order to start a second fermentation. At the proper time the bottles are stored in cool vaults, where the temperature is 50° F. or lower the year round, and where fermentation proceeds very slowly. It is important to keep the vaults at an even temperature, in order to prevent serious loss from breakage which a sudden rise in temperature would cause.

At first the bottles are stacked in horizontal layers, and as the wine begins to mature the bottles are placed in A-shaped racks. The bottles are gradually worked neck downward, in order to bring the sediment, which forms during the slow fermentation, down upon the cork. This is accomplished by the workmen giving each bottle a quick shake once or twice a day during a period of four to six weeks.

When the wine is taken to the finishing room, the sediment down on the cork is "disgorged"—that is, the workman loosens the cork and the lively pressure of the gas in the bottle forces out the sediment, leaving the body of the wine perfectly clear. Champagne in this state is "brut"—almost absolutely "dry." To please the taste and palate of consumers, the wine is sweetened by adding a little liqueur, or "dosage" as the French call it, composed of rock candy syrup dissolved in old wine or brandy. The final operations comprise putting in a fine cork in the bottle, wiring and capping it, pasting on

WINE AND WINE-MAKING

the label and casing the bottles in boxes for shipment. It has been figured that a bottle of champagne from start to finish is handled about 200 times.

Handling and Taking Care of Wine.—It is always necessary to keep casks or barrels of wine in a well-ventilated, cool place. When wine is drawn off, and when there is loss from evaporation, the barrel should be filled up.

New wine soon begins to clear itself by the deposit of solid matters held in suspension. The thick deposit which forms at the bottom of the cask is called the lees. In order to prevent the lees from mixing with the liquid, wines are "racked" or drawn off several times a year. The sudden changes of temperature in the spring and autumn disturb wines, and so it is the practice to rack them at these periods. When racking it is not desirable to let the wine come in contact with the air. In order to obtain perfectly clear wines it is usually necessary to filter or clarify them.

The following method for clearing red wines, such as claret, etc., may be recommended: Take the whites of five fresh eggs for every 50 gallons of wine, beat them up into a foam. Then put this foam into a gallon of the wine to be fined, and after beating it again pour the mixture into the barrel.

Then take a stick and stir the whole barrel of wine until the foam appears at the bung-hole, which should be in about ten minutes. Leave the bung off over night. The next day fill up the barrel with same kind of wine, and drive in the bung. The wine should be bright in from 10 to 15 days; if not, then fill up, and, at the end of another week it should be.

For clearing white wines, such as Riesling, Hock, Sauterne, etc., take one wineglassful of dissolved isinglass for every 50 gallons of wine. Beat this into a foam with a gallon of the wine to be fined. Pour it back into the cask, and follow the directions above given for red wines. Usually the white wines take a little longer time to clarify than do clarets.

Some Diseases of Wine.—Wines are subject to many diseases. They often become "sick." Then they need "nursing" and doctoring.

Acid Wines.—They are due to the change of alcohol into acetic acid under the action of the air and heat. When wine has become slightly sour, rack it into a cask strongly sulphured, and clear it with six whites of egg to about 250 bottles. Some try to correct acid wine by mixing it with good, sound new wines, or with fresh lees, but the cure is only temporary. Wines so corrected only have their acidity disguised, and must be used soon.

Greasy Wines.—When wines turn greasy they cloud and rope like oil. White wines are more subject to this disease than red. Wines weak in alcohol and tannin are subject to the disease. Therefore, the addition of brandy spirits and tannic acid is recommended. Some also use a half a pound of alum for a cask, which should be stirred thoroughly and rack off several days afterward.

Flat or Cloudy Wines.—This is found in wines poor in alcohol and having an excess of albuminous material. The trouble is cured by transferring the wine to a freshly sulphured cask and adding alcohol. The wine should be fined, and after a few days from 50 to 60 grains of tartaric acid per 50 gallons should be added.

Bitterness.—This is, or was, one trouble with French Burgundy wines. The disease is not so common in this country. The defect may be corrected at the start by putting the wine in sulphured cask, and adding sufficient alcohol, tannic acid, and tartaric acid.

Classification of Wines.—The following is a list of well-known types of wines, arranged according to the countries where produced:

1. FRENCH WINES.—Claret, Graves, Sauternes, Barsac, Burgundy, Hermitage, Roussillon, Chablis, Frontignac (Muscat), Champagne, Saumur, etc.
2. GERMAN WINES.—Riesling. The terms Rhine, Moselle, and Pfalz are usually applied to the growths in those districts. The word Hock is also applied to certain Rhine wines.
3. AUSTRIAN WINES.—Voslaue, Goldeck. HUNGARIAN WINES.—Tokay, Ausbruch, etc.
4. ITALIAN WINES.—Barolo, Barbera, Nebbiolo, Valtellina, Asti, Chianti, Lacryma Christi, Falerno, Capri, Marsala, Muscat of Syracuse, etc.
5. SPANISH WINES.—Sherry, Malaga, Val de Penas, Vinos Tintos (Spanish Reds).
6. PORTUGUESE WINES.—Ports, Lisbon, Collares, Carcavellos.
7. MADEIRA AND CANARY ISLAND WINES.—Madeira, Malvasia, Canary (sack), Malmsey.
8. GRECIAN AND IONIAN WINES.—Hymettus, Noussa, Kephisia, Corinth, Patras, Santorin, etc.
9. SWISS WINES.—Neuchâtel, Gringet, and Montreux.
10. TURKISH WINES.—Candia (Island of Crete), Cyprus, Mt. Lebanon, etc.
11. RUSSIAN WINES.—Crimean, Kakhetian (Caucasus), Donski and Krimski Champagnes.
12. AUSTRALIAN WINES.—Australian Burgundy, Hermitage, Sauterne, Port, etc.
13. CAPE OF GOOD HOPE WINES.—Cape Madeira, Constantia.
14. PERSIAN WINES.—Shiraz.
15. WINES OF THE UNITED STATES.—(a) From native varieties of grapes grown east of the Rocky Mountains: Scuppernon (in the Southern States), Catawba, Delaware, Norton's Virginia and Ives, Claret, Concord, Iona, Champagne, etc. (b) European or foreign varieties of grapes are grown in California; therefore we have the following "types": Claret, Burgundy, Zinfandel, Riesling, Sauterne, Port, Sherry, etc.

For convenience we may group some of the leading wines as to color and taste, although it should be remembered that many of them are made in color both red and white; in taste sweet and dry.

RED DRY WINES		Catawba
Claret		Delaware, etc.
RED SWEET WINES		
Burgundy		Port
Hermitage		Tokay
Barolo		Constantia
Valtellina		Roussillon
Chianti		Tarragona (Port)
Zinfandel		
Norton's Va.		WHITE SWEET WINES
Ives Seedling		Sauternes
Cynthiana, etc.		Sherry
WHITE DRY WINES		Muscatel
Graves		Angelica
Sauternes		Lacryma Christi
Chablis		Marsala
Moutrachet		Malaga
Rhine, or		Catawba
Riesling		Delaware
Moselle		Scuppernon, etc.

Alcoholic Strength, etc., of Wines.—The figures in the following table have been taken from the various analyses by competent authorities:

	Specific gravity	Per cent of alcoholic weight on volume
Claret	995.0	9.6
Rhine	992.8	10.2
Sauterne	993.7	11.7
Burgundy	991.3	10.5
Champagne	1010.9	10.4
Sherry (natural)	985.9	16.0
Sherry (fortified)	995.9	16.0
Marsala (natural)	999.2	14.5
Marsala (fortified)	999.2	21.5
Port (natural)	999.2	21.5
Port (fortified)	999.2	21.5
(Specific gravity water = 1000)		

WINE AND WINE-MAKING

During the past 20 years many analyses of European wines have been made, and the data thus obtained have been used for the purpose of arriving at a standard for judging wines. In this way it is possible to determine the purity and quality of any type of wine. The limits of composition and the ratios which have been adopted in European countries for applying analytical results in judging the purity and quality of wines, together with a number of analyses of American wines, have been compiled by W. D. Bigelow of U. S. Department of Agriculture. (See Bulletin No. 59 on "The Composition of American Wines," 1900.)

The standards which have been adopted for European wines are met in all particulars by the best American wines. This is shown by the chemical analyses of American wines receiving awards at the Paris Exposition of 1900. (See Bulletin No. 72, Bureau of Chemistry, U. S. Department of Agriculture, 1903.) According to this report, "the percentage of alcohol in the samples of dry wines conforms to the standards that have been adopted for European wines. The ratio of alcohol to extract and the sum of the alcohol expressed in grams per litre and the total acidity expressed as grams per 100 cc. conform to the ratios adopted in France for wines to which neither alcohol nor water has been added." It is also stated that, the percentage of acids in the samples examined conforms to the standards of the wine-producing countries. These and other facts go to prove (what is not generally known or held) that our American wines challenge favorable comparison with European wines. It is only a few foreign types of special excellence which surpass those which we produce. In all respects—in purity, cleanness, color, taste, bouquet, etc.—the average American wines are better than the average wines drank in Europe.

The Wine Production of the World.—The following figures in most cases from official reports show the vintage of the leading wine-making countries of the world for years 1900 and 1901:

COUNTRY	1900 Gallons	1901 Gallons
France	1,485,719,000	1,523,223,700
Italy	583,000,000	1,013,760,000
Spain	517,000,000	520,080,000
Portugal	138,600,000	155,000,000
Austria	70,400,000	176,160,000
Rumania	91,300,000	87,120,000
Chile	68,200,000	85,120,000
Russia	52,800,000	76,560,000
Bulgaria	74,800,000	73,920,000
Germany	79,200,000	60,720,000
Argentina	40,700,000	55,440,000
Turkey	48,400,000	50,160,000
Greece	19,800,000	32,300,000
Switzerland	34,320,000	31,680,000
United States	31,460,000	29,500,000
Servia	26,400,000	23,760,000

Thus, we see that the United States stands 15th in the list of wine-making countries. The annual wine yield of this country is but a drop in the bucket of the world's supply, which, during the past five years, has averaged about 3,000,000,000 gallons per annum.

The consumption per capita of wine in the United States is very small compared with the immense quantities of wine consumed by the people of Continental Europe. It is hardly half a gallon per person per annum; that is to say,

with a population of 80,000,000 people, the consumption of wines in the United States is now about 40,000,000 gallons per annum. The city of Paris alone consumes almost that quantity of wine in a year.

Statistics show that Americans are a coffee-, beer-, and whiskey-drinking people. The daily use of light wines at table is confined to a comparatively small number in this country, mostly to those of foreign birth or parentage. There are those who believe that the drinking of light wines is conducive to temperance. Thus, they point to the example set by the millions of wine-drinking people of Europe, where almost every man, woman and child drinks his wine at meals, and where drunkenness is not the evil it is in other countries. However, the consumption of wine has been increasing year by year in the United States, and at the present rate it is likely to be doubled within the next 15 or 20 years.

The Wine Industry in the United States.—The wine industry in this country is of comparatively recent date and growth. In 1850 the total output of wine in the United States was not more than 250,000 gallons. In 1860 it was about 500,000 gallons. In 1870 it had risen to about 5,000,000 gallons. In 1880 the wine yield of the country was about 15,000,000. In 1890, when the statistics of viticulture were gathered for the first time in the United States, there were 307,000 acres of vineyards, and a production of over 24,000,000 gallons of wine. The census of 1900 showed a production of over 30,000,000 gallons of wine for the United States.

According to the 'American Wine Press,' as against the output of about 35,000,000 gallons of wine in 1902, the estimated yield of 1903 is about 33,500,000 gallons, as follows:

	Gallons
Southern States.....	1,500,000
New York	4,500,000
Ohio	3,000,000
Western States.....	1,000,000
California	23,000,000
All other States.....	500,000
Total wine crop.....	33,500,000

The greatest progress in viticulture and wine-making has been made in California during the past 20 years. That Golden State with its great range of climate and with its variety of soils has an area almost equal to that of France. The production of wine in California began to assume large figures in 1877, when it was 4,000,000 gallons. In 1880 the yield was more than double, or 10,000,000 gallons. In 1890 the wine crop of California rose to fully 20,000,000 gallons. The estimated vintages of California wines during the past ten years (1893-1903) have been as follows:

YEAR	Gallons
1893	22,000,000
1894	16,000,000
1895	14,000,000
1896	13,500,000
1897	34,000,000
1898	18,500,000
1899	23,430,000
1900	23,600,000
1901	22,500,000
1902	25,000,000
1903	23,000,000

Two Distinct "Types" of American Wines.—The wines produced in the United States are divided into two classes: (1) Wines made east of the Rocky Mountains; (2) wines of California and the Pacific Coast States.

WINE-BERRY — WINES

This division is due to the fact that there are two entirely different stocks, or kinds, of grapes grown in the United States.

East of the Rocky Mountains, only American or native varieties of grapes are grown.

In California and on the Pacific Coast, practically only European or foreign varieties of grapes are grown.

Therefore, our Eastern wines are of a different "type" from California wines, which for the most part resemble and have the well-known characteristics of their European prototypes.

The leading grape and wine-growing States east of the Rocky Mountains are: North Carolina, Virginia, New Jersey, New York, Ohio, Michigan, and Missouri. The bulk of the grapes grown in these States are still used for eating or table purposes.

Considerable progress in Eastern wine-making has been made in producing a fine quality of champagne by the French process of fermentation in the bottle. A number of brands of American champagne, in color, taste, sparkle, and purity, compare very favorably with the best imported kinds. The headquarters of the champagne industry in the United States is in the Lake Keuka region of Western New York, which produces about 75 per cent of the output. Considerable champagne is also produced in northern Ohio, and thus far only a small amount in California. The total production of American champagne is now estimated at more than 100,000 cases, or 1,200,000 bottles per year.

In conclusion, the manufacture of wine and champagne is an infant industry in the United States. But we have in the Eastern States and in California, all the opportunities and all the conditions for success. We have here the right climates, the proper soils, the best varieties of grapes, sufficient capital, and the most intelligent labor and supervision in the world. Therefore, with all these things, and with the growing demand and liking for wines, the wine industry should have a great and prosperous future.

Bibliography.—The best books on wines and wine-making are in French or German. The following standard French works may be noted: Ladrey, *L'Art de faire le Vin* (1882); Maumene, *Traité theorique et pratique du travail des Vins* (1890); Coste-Floret, *Procédés modernes de Vinification* (1895); Salleron et Mathieu, *Etudes sur le Vin Mousseux* (1895); Sebastian, *Les Vins de Luxe* (1897).

There are but few books in English of recent date on wine-making. We note the following: Thudichum & Dupré, *Origin, Nature, and Varieties of Wine* (1872); Rixford, *The Wine Press and the Cellar* (1883); Husmann, *Grape Growing and Wine Making* (1897).

LEE J. VANCE,

Editor *American Wine Press*, New York.

Wine-berry, a Japanese plant (*Rubus phanicolasius*), with long recurving canes which root at the tips and are clothed with red glandular hairs. The leaflets are usually three, white, tomentose beneath, and the flowers are in dense axillary clusters, forming a loose panicle. The bristly calyx-lobes enlarge in fruit, and enclose the immature berry as in a bur, but eventually spread apart; the mature fruit is small, soft, cherry-red in color, in flavor insipid or acid. The wine-berry is said to prolong the season of *Rubus* fruits, as it ripens in

September, and to be good for preserves. The plant is also interesting, especially in spring, for the shrubberies.

The grape, the whortleberry, the gooseberry, and the red and the black currants are called wine-berry; as are also the edible, berry-like fruits of the poisonous toot-plant (*Coriaria sarmentosa*), a large shrub of New Zealand.

Wine Measure, an old English measure by which wines and spirits were sold. The gallon contained 231 cubic inches.

Wine Press, a machine in which the juice is pressed out of grapes. The wine press of the Bible was a vat, in which the juice was expressed by the feet of men who trampled the fruit.

Winebrenner, win'brën-ër, **John**, founder of the denomination known as the "Church of God": b. Frederick County, Md., 24 March 1797; d. 12 Sept. 1860. He was ordained a minister of the German Reformed Church in 1820, and was called in the same year to the Salem Church, Harrisburg, Pa. He retained that charge until 1827 when his outspoken attitude against slavery and the traffic in intoxicating drinks led to his being asked to withdraw, and in 1828 he ceased to be connected with the Reformed Church. In October 1830 he established the denomination called the "Church of God," whose members also became known as Winebrennerians. He edited for some time the 'Gospel Publisher,' afterward the 'Church Advocate,' and issued several works, including 'A Treatise on Regeneration'; 'Practical and Doctrinal Sermons'; the 'Church Hymn Book'; etc. See CHURCH OF GOD.

Winebrennerians. See CHURCH OF GOD.

Wines, Enoch Cobb, American penologist: b. Hanover, N. J., 17 Feb. 1806; d. Cambridge, Mass., 10 Dec. 1879. He was graduated from Middlebury College, Vt., in 1827, taught school in Philadelphia and Burlington, N. J., and entering the Congregationalist ministry in 1849 held pastorates at Cornwall, Vt., and Easthampton, L. I. He became secretary of the New York State Prison Association in 1862, and afterward devoted his life to the promotion of reform in the administration of criminal law and treatment of criminals. He founded the National Prison Association in 1870 and was instrumental in securing the attendance of representatives from 26 governments at the International Penitentiary Congress in London 4 July 1872. Among his writings are included: 'Two Years and a Half in the Navy' (1832); 'A Trip to China' (1832); 'Hints on Popular Education' (1838); 'Prisons and Reformatories in the United States and Canada' (1867); 'State of Prisons and Child-Saving Institutions' (1880).

Wines, Frederick Howard, American statistician, son of E. C. Wines (q.v.): b. Philadelphia, Pa., 9 April 1838. He was graduated at Washington College, Pa., in 1857, and studied at Princeton Theological Seminary; was a chaplain in the Union army 1862-4; pastor of the First Presbyterian Church, Springfield, Ill., 1865-9, was secretary of the Illinois State Board of Commissioners of Public Charities 1869-93, and again 1897-9. He was made assistant director of the United States census in 1899.

WINFIELD — WINLOCK

His publications include: 'Defective, Dependent, and Delinquent Classes in the United States' (10th Census); 'Crime, Pauperism, and Benevolence in the United States' (11th Census); 'Punishment and Reformation' (1895); 'Liquor Problem in Its Legislative Aspects'; etc.

Win'feld, Kan., city, county-seat of Cowley County; on the Walnut River, and on the Missouri Pacific, the Atchison, T. & S. F., and the St. Louis & S. F. R.R.'s; about 40 miles southeast of Wichita. It was settled in 1870, and in 1871 was incorporated. The chief industrial establishments are flour mills, grain elevators, machine shops, and stock yards. In the vicinity are limestone quarries. In 1900 (government census) Winfield had 75 industrial establishments, capitalized for \$588,481, whose annual finished products brought \$1,136,346. It has two schools of college rank; Saint John's Lutheran College, opened in 1893; and Southwest Kansas College (M. E.), opened in 1886. Other educational institutions are a public high school, Winfield Business and Academic College, public graded schools, a public and school libraries. The State Imbecile Asylum of the Southwest is located here. The three banks have a combined capital of \$200,000 and deposits (1903) amounting to \$1,470,750. Pop. (1890) 5,184; (1900) 5,584.

Wing, an organ of flight. In birds, the wings consist of the bones of the fore limbs, specially modified to form a support and axis, while attached to this skeleton are the muscles moving the limb (see ORNITHOLOGY), externally clothed with strong flight-feathers or "wing quills." (See FLIGHT.) In the bat (q.v.) the wing consists of an expansion of the skin, supported on four of the fingers, which are extremely long. This leather-like membrane, or "patagium," extends from the fore limbs to the hind limbs, and in many cases between the hind limbs and tail as well. In such mammalia as the flying-foxes, flying-squirrels, flying phalangers, and in the lizards known as flying-dragons (q.v.), the wing is a mere expansion of skin, extending along the sides of the body, often connecting hind and fore limbs, and serving as a parachute to sustain the animals in their flying leaps from tree to tree, but in no sense serving as an organ of true flight. In insects (q.v.), the wing is formed of two delicate skin layers, supported on hollow tubes or *nerve-tubes*, placed in communication with the respiratory or breathing system. The wings of insects become thus related to respiration, and by their movements probably aid in the diffusion of air through the breathing tubes.

Win'gate, George Wood, American lawyer: b. New York 1 July 1840. He was educated in the public schools, and served with the 22d New York Volunteers during the Civil War. He originated systematic rifle practice for the instruction of the National Guard, and through his efforts the Creedmoor rifle range on Long Island was established. He was president of the National Rifle Association for 25 years, and is the author of 'Wingate's Manual of Rifle Practice' (1872); 'The Great Cholera Riots' (1880); 'On Horseback Through the Yellowstone' (1886); 'History of the 22d Regiment' (1896); etc.

Winged Bull, in architecture, a decoration of frequent occurrence in ancient Assyrian temples, where winged human-headed bulls and lions of colossal size usually guarded the portals.

Winged Lion, the symbol of the evangelist Saint Mark, which was adopted as the heraldic device of the Venetian Republic. A celebrated bronze figure of the winged lion of Saint Mark surmounting a magnificent red granite column, formed out of a single block, stands in the Piazzetta of Saint Mark at Venice.

Wing'shell, the name of several bivalve shells, which have wing-like extensions of the hinge-margin, as *Unio alatus*, or are wing-shaped; especially species of the genus *Pinna*. See PINNA.

Win'fred, Wenefride, or Winefride, Saint, according to the legend, a noble British maiden, possibly of the 7th century, whose head the Prince Caradoc cut off when she fled from his unholy proposals. The head rolled down a hill, and where it stopped a spring gushed forth; famous afterward as a place of pilgrimage, Holywell in Flintshire. She was restored to life by Saint Bueno, who replaced her head, survived the miracle 15 years, and after the death of Saint Bueno entered the nunnery of Gutherin, in Denbighshire. Her festival is observed on 3 November.

Winkelried, vink'el-rêd, **Arnold von**, Swiss patriot. He was a knight of the Swiss canton of Unterwalden, whose self-sacrificing valor is said to have decided the victory of Sempach, 9 July 1386. The Austrian troops, under Archduke Leopold, were formed into a compact body which resisted the efforts of a small body of Swiss drawn up in the form of a wedge and rushing to the attack. The Austrians were now beginning to surround their enemies when Winkelried, seeing the desperate condition of affairs, burst from the ranks, threw himself upon the ranks opposed to him, and, grasping all the pikes within his reach, buried them in his bosom, and bore them by his weight to the earth. Over his dying body his companions rushed into the opening he had made in the Austrian line and defeated their enemy with great slaughter. The truth of this legend has been much discussed, but in 1886 a monument to Winkelried was raised at Stanz, Unterwalden. Consult: H. Von Liebenau, 'Arnold von Winkelried, seine Zeit und seine That' (1862); Kleissner, 'Die Quellen zur Sempacher Schlacht und die Winkelried Sage' (1873); Burkli, 'Der wahre Winkelried: die Taktik der alten Urschweizer' (1886); T. Von Liebenau, 'Die Schlacht bei Sempach.'

Winkle, a local name about Long Island Sound and New York Bay for either of the large conchs (q.v.), *Fulgur* and *Sycotypus*, which are extremely common and very destructive to cultivated oysters. Their shells were utilized by the Indians as spoons, ladles, digging-tools, etc.; and out of their central columns were made the inferior beads called "white wampum."

Win'lock, Joseph, American astronomer: b. Shelbyville, Ky., 6 Feb. 1826; d. Cambridge, Mass., 11 June 1875. He was graduated from Shelby College in 1845 and in that year was appointed professor of mathematics and astron-

WINNEBAGO — WINNIPEG

omy there. He was engaged as one of the computers in the office of the 'American Ephemeris and Nautical Almanac' in 1852-6, and in the last mentioned year was appointed professor of mathematics in the United States navy. He shortly afterward returned to the office of the 'Nautical Almanac' as second superintendent, but in 1859-61 was at the Naval Academy at Annapolis, Md., in charge of the mathematical department; on the outbreak of the Civil War he resumed direction of the 'Almanac.' In 1866 he was appointed to the chair of astronomy at Harvard, at the same time becoming director of the observatory at Cambridge, in which offices he continued until his death. He was elected by Congress to the National Academy of Sciences in 1863, was in charge of the expedition to Kentucky to observe the solar eclipse of August 1869 and of that to Spain in December 1870. He made numerous and important improvements in the equipment of the Harvard Observatory, and his researches and observations were of great scientific value.

Winnebago (Algonquian name: "Turbid water people"), an important tribe of the Siouan stock of North American Indians, who are closely related to the Chiwere division (the Iowa, Oto, and Missouri) and to the Mandan. Their own name is *Hochångara*, "People of the parent speech." They were first mentioned in the Jesuit Relation of 1636, but the first use of the name Winnebago occurs in the Relation of 1640. It is said that they were almost annihilated by the Illinois tribe in early days, and that the historical group was made up of the survivors of this warfare. In 1639 they were on Green Bay, Wis.; in 1736 they resided on Lake Superior, but by 1761 they were again on Green Bay and in 1788 had a village on a small island in Winnebago Lake. In 1822 their population was estimated at 5,800 and their country extended from Winnebago Lake southwestward to the Mississippi. By treaty of 1825 and 1832 they ceded their lands south of Wisconsin and Fox rivers for a reservation on the Mississippi above the Oneonta; in the latter year one of their villages was at Prairie la Crosse. They suffered several visitations of smallpox; the third, which occurred in 1836, carried off more than a quarter of the tribe. A part of the Winnebago long remained widely distributed over their old country east of the Mississippi and along that river in Iowa and Minnesota; in 1846 they surrendered their reservation for another above the Minnesota, and in 1856 they were removed to Blue Earth, Minn. Here they were mastering agriculture when the Sioux war broke out and the settlers demanded their removal. Those who had taken farms were permitted to remain, but the others were taken to Crow Creek, on the Missouri, whence they soon escaped; but their privations and sufferings were such that of the 2,000 removed to Crow Creek, only 1,200 reached the Omaha reservation, whither most of them had fled. These survivors were assigned a new reservation on the Omaha lands, where they remain, allotted lands in severalty. There are now 1,131 under the Omaha and Winnebago Agency, Nebraska, and 1,403 in Wisconsin. See McGee, 'Siouan Indians' (14th Rep. Bureau Amer. Ethnology, Washington, 1897).

Winnebago, wīn-ě-bā'gō, a lake in the eastern part of Wisconsin, the largest in the State. It is about 750 feet above sea-level, nearly 28 miles long and 10 miles wide in the broadest part; area, 212 square miles. It has an abundance of fish. Its clear waters, well wooded shores, with the pretty towns intervening, make it most attractive. On the east shore is found a curious wall made by stones being pressed against the shore at times of ice expansion. The Fox River is both an inlet and an outlet of the lake. It is navigable from its mouth at the head of Green Bay; so Lake Winnebago has steamer connections, by means of the Fox River and Green Bay, with the Great Lakes.

Winnemucca, wīn-e-mūk'a, Nevada, town, county-seat of Humboldt County; on the Humboldt River, and on the Southern Pacific Railroad; about 170 miles northeast of Reno. It is in a silver mining region, and is surrounded by some excellent farm lands. It has large shipments of live-stock, beef, and wool, and some grain. The national bank has a capital of \$82,000, and, in 1903, deposits of \$626,170. Pop. (1890) 1,037; (1900) 1,110.

Winnemucca, a lake in the western part of Nevada. It is in a desert valley in which is Pyramid and several other lakes. Winnemucca is 26 miles long, north to south, from two to five miles wide, and from 50 to 87 feet deep. Truckee River is the only inlet, which is also an inlet of Pyramid Lake. It has no apparent outlet. The mineral matter, chiefly salt, is 3.6 parts per 1,000.

Winnepesaukee ("Beautiful water of the high land"), a division of the Pennacook confederacy of the Algonquian stock of North American Indians, formerly inhabiting the vicinity of Winnipiseogee Lake, New Hampshire.

Winninsh. See OUANANICHE.

Winnipeg, Canada, a city, capital of the province of Manitoba, situated on the prairie at the junction of the Assiniboine and Red rivers, which latter runs north from the city for 45 miles and empties into Lake Winnipeg, an immense body of water encircled by the forest and noted for the abundance and excellence of its whitefish. Winnipeg is the midway city between the Atlantic and Pacific oceans on the Canadian Pacific, the transcontinental railway of Canada. The city is likewise equidistant from the shore of the Gulf of Mexico on the south and the Arctic Sea on the north. Winnipeg is a railway city of radial importance. In addition to its communications east and west on the main line of the Canadian Pacific Railway, it has also the Emerson, Gretna, Deloraine, Glenboro, Lac du Bonnet, and Lake Winnipeg branches running to different parts of the province. Another great railway running from Lake Superior to Edmonton—a stretch of 1,500 miles—the Canadian Northern, has its headquarters in Winnipeg, which in addition to its main line, east and west, has Red River Valley, Neepawa, Lake Manitoba, and Hudson Bay branches to various provincial points. In addition to these great railroad systems, Winnipeg is the central point of the Grand Trunk Pacific Railway, now being built from the Atlantic to the Pacific by the Canadian government. Winnipeg has likewise navigation down the Red

WINNIPEG

River, and on the completion of the Saint Andrew's locks, now well advanced, north of the city, and a similar work at Grand Rapids, on the Saskatchewan River, will have steamboat communication with Lake Winnipeg and up the great Saskatchewan for 1,000 miles to the foot of the Rocky Mountains. The city has eight substantial bridges across the Red and Assiniboine rivers. Those across the Red River connect with Saint Boniface, a French suburb of some 2,000 people, and those across the Assiniboine with the southern ward of the city, known as Fort Rouge.

In trade Winnipeg is the great city of western Canada, and is the centre of the wholesale and jobbing trade of the Canadian west. Being the grain shipping port eastward from the prairies the city may be compared to a great elevator spout through which the products of the West reach the markets of the world. It is the largest wheat exporting centre on the American continent, as shown by the figures of 1903. These are: Duluth-Superior, 42,406,923 bushels; Chicago, 37,940,953 bushels; Winnipeg, 51,833,000 bushels. The completion of the Saint Andrew's water power, and the immense Lac du Bonnet electric power being constructed on the Winnipeg River, bids fair to make the city an important manufacturing centre after the model of Chicago. At present the industries established in the city are furniture and upholstery, brooms and brushes, oatmeal, flour and grist mills, awnings, tents, and mattresses, clothing, bookbinding, carriage works, soda water works, breweries, biscuit, confectionery, and baking products, coffee and spice mills, harness and saddlery, marble works, tinware, sash, door and boxes, saw-mills, cigar factory, oil-mills, plumbing and gas, tanneries, soap, jewelry, etc.

The city has retained a number of its municipal franchises. The water supply of the city is of immense capacity from one great artesian well some 60 feet down to the limestone (Trenton) rock. The water is exceptionally pure and is provided at a low cost. The city owns its own street electric light system; its own asphalt plant (being the first city in America to own its asphalt plant); has a stone quarry; and a most complete and efficient fire protection system. Originally begun on a bare prairie of black alluvium, the city has, during the last seven years, devoted much attention to street and other improvements. Ten parks in different parts are tastefully laid out and cultivated. Trees have been planted and boulevards constructed at the public expense, and so marked has been the transformation that it is now proposed to change the name the "Prairie City" to the "Elm City."

The following statistics (1903) are interesting:

Area of city in acres.....	12,750
Miles of boulevards and trees.....	44
Miles of asphalt pavement.....	12
Miles of macadam pavement.....	30
Miles of stone sidewalks.....	16
Miles of plank sidewalks.....	179
Miles of sewers.....	70
Miles of water-mains.....	80
Miles of street railways.....	18

As being the trade centre of western Canada, Winnipeg is also the financial headquarters of the region. Indeed, Winnipeg stands third as a financial centre in Canada, coming after Mon-

treil and Toronto. There are doing business in the city 13 chartered banks, representing a paid up capital of nearly \$50,000,000 and including almost all the leading banks of Canada. Between the years 1894 and 1903 the bank clearings rose from \$50,540,048 to \$163,105,124. Almost all the loan and investment companies as well as fire and life insurance companies of eastern Canada are represented. The annual expenditure for maintenance and improvement is about \$800,000. The building permits for 1903 summed up \$17,150,000.
